### A Junior T.T. in the Wet.

**L**AST week we mentioned that there was a strong probability that wet would be experienced in this year's T.T. races. It was so in the Junior event, and, all things considered, it has been a blessing in disguise, for, as we expected, troubles were more pronounced, and those that made themselves evident would have been absent if the roads had been dry. Naturally we refer to belt transmission, and the absence of properly designed mud shields. Some really excellent specimens were used, though in many cases the riders dispensed with these necessary fitments, and no doubt the race has taught valuable lessons in this respect. The fact is that the small engine pulley of the average Junior machine is the weak point of its transmission. Efficient as these pulleys are on dry surfaces, all sorts of troubles crop up on wet roads. Effective magneto and plug covers must also some day be standard; fully twenty stops were recorded through absence of these protectors.

In comparison with last year's race over the same course the average speeds were slower. When we consider that the winner stopped eight times in all, the poor comparison is explained, especially when it is taken into consideration that the state of the roads was very bad in places, especially early in the race. Beyond Ramsey, for example, much water lay upon the course, and those of the competitors who were not wise enough to take the path suffered either belt or magneto troubles. The splashing of the water on the belts caused violent belt slipping, and the sousing of the magnetos naturally produced short circuiting.

The silencing question was not well dealt with this year. Silencers are, of course, out of place in a race,

but as this is a race for touring machines silence ought to be taken into consideration, though we realise the difficulty of fixing a standard of silence. The organisation was excellent, and the scoring board was splendidly arranged. The weather, though bad at the start, became magnificent, and the race as a whole was a great success. The industry was excellently represented among the spectators, and while the number of ordinary sightseers was considerable, the race was a trifle slow at times, and at the starting and finishing point there was little excitement, but this was only to be expected as there were comparatively few competitors and the course was a long one.

As regards reliability under racing conditions, eleven finished out of twenty-one who started. This is about the average of previous races, but hardly good enough we think. It is the pace which kills, as the old proverb says, and we think it would be wise before the industry decides not to give further support to such contests to seek first to improve these averages, for it is doubtful whether standard machines run at their highest speeds over the same course and under the same conditions would behave any better. It should be remembered that previous Tourist Trophy races have been invariably favoured with fine weather and dry roads, therefore the trade has perhaps been led to think that the lessons to be learned from road racing have lost their importance. Last Friday's contest, however, proved that roads and weather, which would have little or no effect on the reliability of a motor cycle at ordinary touring speeds, found out the weak spots when the machines were urged to their utmost limits. The results are a distinct score for the multi-cylinder engine and counter-shaft transmission.

## A WEEKEND EXPLORING EXMOOR.

*Some Notable Gradients Discovered* ————— *By L.W. Spencer*

(Concluded from page 707.)

Descending Beggars' Roost would provide a tip-top braking test, especially if the A.C.U. would make it a timed descent with a maximum time.

We then followed the Ilfracombe Road for about one mile, when we took a turn to the right opposite a little railway bridge where signposts point "To Martinhoe" and "To Lynton Golf Club." Going straight along this lane, we went across the Lynton Golf Links. The surface of this lane was very rough and stony, and in places overgrown with grass and several gates had to be opened. After passing the third gate, four cross-roads were reached; here we took the right-hand turn to Martinhoe, and followed this for about half a mile, when three roads were reached. Turning to the right here, where the signpost points "Woody Bay," we followed the road right down to the sea through the most charming scenery imaginable. Halfway down we found a closed gate across the road and a notice "Motor cars not allowed." Being on the more humble motor cycle we opened the gate, closed our cut-outs, and went on down hill until the road all but disappeared. Clambering the last few yards over the rocks on foot, we once more found ourselves at sea level.

### A Dangerous Fence.

Then we started the long climb up again, and a long climb it was on low gear with cut-outs shut! After repassing through the gate where the notice had been placed, we took the road to the right that could be seen winding along round the cliffs. What with hairpin corners, great gutters across the road, and stretches of

loose rock and stones to boot, there was no T.T. work on this bit. Moreover, the road is nearly on the edge of the cliff, where sometimes it seemed that only a skid would be required to pitch you into the sea hundreds of feet below, and, in the most dangerous places, there is a "fence" to "save" anyone from falling over, but I should not like to see a sparrow risk its life by sitting on it.

### Hunters' Inn to Trentishoe.

The road then wound right round Highveer Point, turned in again by the side of the R. Heddon, until we suddenly found ourselves at Hunters' Inn, one of the most charming and secluded retreats in Britain. Passing right across the front of the inn, we bore to the right and followed the road for half a mile until we reached two cottages, where a little lane turns up to the right and a signpost points "To Trentishoe." At the top, we were told, was Trentishoe village and church, but that we should never get up there, as no motors had ever been up before. This was too tempting, and we set off up at once. Riding for a few hundred yards over rocks, stones, and watercourses that nearly pitched us off the machines, we wondered what would happen next. However, after several bad corners and a terrific climb, at last some cottages and the church hove in sight, but with the road still going up. Holding on for dear life, and thinking that we were up, what was our dismay when the road suddenly shot up still steeper and disappeared round a hairpin corner to the left.

The writer on the first hairpin bend Hookway Hill between Carsford and Porlock.  
The machine is a three-speed Rover.

Removing a cover after undergoing a severe test on Hookway Hill, where the surface was of the worst.

**A Week-end Exploring Exmoor.—**

On went the throttle, and slowly we wound up and round that tortuous bend, and with huge delight found ourselves actually at Trentishoe. The cottagers all came rushing out to welcome us, and assured us we were the first motorists who had ever ridden up. After obtaining some bread and cheese off a kindly dame, we set off down again and safely emerged once more at Hunters' Inn. Thus was Trentishoe added to the trophies of the chase.

**Hunters' Inn to Martinhoe.**

Still anxious for fresh worlds to conquer, we then tried the road up to Martinhoe opposite the inn, before proceeding to Combe Martin. This proved to be a very bad rise, known as Mannicott Hill, about one mile long, with the usual acute corner, but we surmounted it quite easily. It was, however, a very long trying climb, and would prove a real terror with a fixed gear. Dropping down again to Hunters' Inn, we took the Combe Martin Road, leaving the now conquered Trentishoe on our right. Soon we were once again climbing, the road reaching 1,000 feet above sea level in a very short distance. We found it a comparatively easy rise, although a 1,000 feet climb is never to be despised.

Reaching four cross-roads, we took the un-directed road to the right instead of the usual Combe Martin Road. This un-directed road keeps to the top of the moors, and falls into Combe Martin by a long winding hill of a severe character, but the views obtained from it are far grander and more impressive than those from the usual route in the valley.

Turning to the right at Combe Martin, we very soon traversed the few remaining miles to Ilfracombe, which seemed an enormous size after the tiny villages to which we had become accustomed. On the return journey, for a change, we took the main road back through Parracombe, and safely arrived in Lynton without incident.

This is another section of the Six Days' Route, part of which will be taken both ways. If it is wet special caution should be exercised between Ilfracombe and Parracombe, as when wet I have found this road more skiddy than anything it has been my ill luck to strike elsewhere. There is a special surface of chalky, limy slime which will strike terror into the heart of the smooth tyre brigade!

The double Parracombe dip up and down should give no real trouble. There is a nasty right angle turn on the one up to Lynton, and a bad turn to the left on the one to Ilfracombe, otherwise it is plain sailing.

Calling later at a postcard shop we happened to mention the fact that we had climbed Porlock, Lynmouth, Beggars' Roost, and Trentishoe. What was our surprise when we were told that we had not yet conquered the worst of all, namely, Station Hill, this being the main road up to the station from Lynton. It seemed incredible that there could be another hill higher yet, but it was only too true.

**Station Hill, Lynton.**

Turning to the right down a very steep pitch opposite the lift, we traversed a couple of streets and sure enough found the road darting up again in a most extraordinary manner. The gradient got steeper and steeper, and the surface beyond description, until on almost the worst bit there was only loose shale to ride over. Still, we did it, and Station Hill was added to the list of our victories. Though I had visited Lynton many times never before had I ever heard of this hill. The gradient must rival Beggars' Roost, and the sur-

face is incredibly worse, and the machine that will climb it will do anything. Lynmouth and Porlock are child's play to it. Calling at the Post Office on our way back we were delighted to find a little package awaiting us in the shape of two brand new B. and B. racing model variable jet carburettors.

A little later and we were once more safely in the "Blue Ball," talking over the struggles of the day, and wondering what the morrow would bring forth, and whether we should yet find our Waterloo.

The next day we set off with light hearts and our new carburettors fitted, to explore the Oare and Doone valley

district, and pay a proper visit to Porlock Hill.

**Hookway Hill.**

Leaving Lynmouth by the Watersmeet Road we followed it to Hillsford Bridge. Turning to the right we took the new motor road to Simonsbath as far as the top of the hill, but then followed it right round instead of turning off to Simonsbath, until we reached the Brendon signpost. Taking the road indicated, two steep pitches down brought us to Brendon and so on to Oare. The usual thing to do then is to turn off opposite Oare Church, when a well-made road and easy hill bring you to the top of Exmoor and the Porlock Road. This is the easy way out of Lynmouth where Countisbury Hill presents any difficulty. However, being out for the worst that could be found we followed the bottom road on past Oare Church to Oareford, when we discovered another steep ascent known as Hookway Hill, leading up to the Porlock Road. It is a typical Devonshire rise, with awful sur-

Des ending Hookway. Observe the stony surface.

### A Week-end Exploring Exmoor.—

face and a heart-breaking corner. We climbed it, however, with the same steady success that now seemed inevitable.

It is a much more difficult hill than Porlock or Lynmouth, and so far as we could ascertain we were the first motor cyclists to climb it. Reaching the Exmoor Road, a short run of a mile or so brought us again to the renowned Porlock, up and down which we went with the greatest of ease, so as to get a few snapshots and to measure its length. From the Ship Inn, where the hill begins, to the junction of the new and the old road, it was just over three miles, and to the top of the worst part, *i.e.*, just past the second corner, just over one mile.

### A Race with a Red Deer.

We then proceeded quickly to jog along back to the Blue Ball. Suddenly from out of the wood leisurely stalked a wild red deer. The moment it emerged

from the hedge it sighted us, leapt on to the road, and darted off like the wind. Here was fine sport indeed! I dashed the throttle open and leaned over and opened the jet as the engine crashed over with its answering roar. Faster yet and faster still, until I knew I was gaining. But the corners came thick and fast, and how that animal took the corners "all out" was a revelation. I lost heavily on each one, but with a few bits of straight going, including one mad rush down hill, I began to gain fast until I was but a few yards behind. For over a mile we tore along at over forty miles an hour by speedometer, now gaining a bit and now losing a bit, and never but a few yards between us. Then came a succession of bad corners, and I was hard put to hold my own until the road opened out down a little hill again. "Ah," I said, as I pushed the throttle over, "now's my chance to win my first race." Away thundered the Rover, and I drew closer still, when suddenly the road swerved to the left and for an instant I saw my quarry in the air as it leapt a wall and disappeared in the forest. Thus ended the hottest race I have ever run, and few indeed must be the motor cyclists who have been paced by an Exmoor deer!

The next day we regretfully turned our faces homeward; first running up Lynton and Station Hill for some photographs. From Lynton we made for Beggars' Roost, which we took on the run, and thus reached the Watersmeet Road again and followed it to Porlock, *via* Brendon, Oare, Oareford, and Hookway.

### Dunkery Beacon.

Now was to come the tit-bit of our tour. Poring over the map in the Blue Ball the night before, we had decided to attempt a climb of Dunkery Beacon,

the highest point on Exmoor, 1,707 feet above sea level. Leaving Porlock by the Minehead Road, we took a right-hand turn to Horner, about a mile out. Following the lane round through the village of Horner, and past an old mill, we reached four cross-roads. Here we took the Cloutsham Road, which at once began to rise to the moors. About a mile further on we reached a junction of two roads, when we took the left-hand turn which we could see wandering away in the distance up towards Dunkery. At the cross-roads we had found we were only about 300 feet above sea level, but there soon commenced a telling climb. The road was narrow and shockingly loose, with a terror all its own in the shape of little gullies cut right across the road every hundred yards or so for "drainage" purposes.

Sometimes the road would shoot up from these gullies in an appalling manner, but no "rushing" was possible, only a long slow grind on low gear. Such a bumping I've never had in my life before, and how the frame and forks stood it is a marvel. Suddenly the engine roared round, and for the first time in my life I found I had broken a Forward fastener. And no wonder! A replacement was but a matter of a moment or so, and once more I was speeding up.

After 1½ miles of this gruelling, during which we had climbed over 1,000 feet, we had to leave the road, which, after reaching 1,453 feet above sea level, goes on over the moors to Cutcombe. A man in a

Dunkery Beacon, showing the kind of loose stones which had to be ridden over. This point is about 1,707 feet high.

waggonette here appeared on the scene and assured us we were the first motorists ever seen on the Beacon. He pointed out a path leading off the road to the right which we could see winding its way to the summit now in view. My chum looked at the path with dismay and said it was useless to attempt it. It looked more like the bed of a river than a path, and in places there was not a foot to ride on. However, it was unthinkable that we should be baulked now. Go on we must. With some trepidation we let in the clutches and mounted the bank up to the path, and set off on this last lap. This was about the worst ride it has ever been my lot to tackle. It was not the gradient that troubled us but the indescribable nature of that "path." Stones and rocks lay about its narrow way, with yawning pot-holes galore. The bumping on the road was bad enough, but this lot beggared description. Tossed about like corks on the sea we slowly and laboriously made our way up until at last we were at the foot of the great mound which forms the summit. Once more the throttle went over, and with a roar of triumph and delight the engine bore us right up to the very foot of the cairn itself. Dunkery Beacon was conquered. Just as we were starting to devour a picnic repast a gentleman and his wife and

**A Week-end Exploring Exmoor.—**

child appeared, who had come up on foot, and this gentleman kindly gave us his name and address as a witness of our feat.

**The Start for Home.**

After a few photographs had been taken, we once more set out for home and civilisation. Regaining the road we reached Cutcombe and pulled up at the "Rest and Be Thankful" Inn. Here we made further enquiries, and found we were indeed the first motorists up the redoubtable "Dunkery." Leaving Cutcombe, we travelled by lovely and secluded by-lanes through Luxborough, Kingsbridge, and Roadwater to Washford on the main Minehead Road. Here we raised our gears, and then made a fast and uneventful ride to Gloucester, which was reached at 7.30 p.m., the only incident worth recording being the fact that I easily registered over sixty miles an hour on the level by Cowey speedometer, with about 30 lbs. of luggage aboard. A no-trouble run back to London next day brought to an end one of the finest tours it has ever been my lot to accomplish. The distance covered was 514 miles. The petrol used about 6½ gallons. One puncture, the broken belt fastener, and one stop to adjust the belt with a spare link, were my only mechanical stops during the whole run. My friend fared even better than I, only once adjusting his belt.

Not a nut was touched or a plug removed nor a nut lost or a spring broken. The Armstrong gear was beyond all praise. It never failed and gave no trouble. It was a complete revelation, and I am finally converted to the speed gear. A Dunlop belt was used throughout and looks good for thousands yet.

I have not had space to deal with the scenery and the many unequalled joys of North Devon. They must be experienced to be believed. At this juncture what better advice can I give than to join the A.C.U. and enter for the Six Days' Trial.

For those who do not know Devon and its joys this will be a fresh treat and a new experience.

Of the Blue Ball I have written before. The best of everything is its motto, and our bill for supper, bed and breakfast, for Friday, Saturday, and Sunday was only 12s. 9d. each, and a tip-top garage thrown in.

Lastly, I cannot close this article without taking off my hat to the 1912 three-speed Rover, which went so surely and so faithfully throughout.

(Unfortunately the actual photographs taken on the trip were not suitable for reproduction. Another run over the course was, therefore, made with *The Motor Cycle* photographer mounted on his Douglas, and one or two friends, for the purpose of securing some larger and better prints.)

## ENGLISH-DUTCH TRIAL.

### THE DUTCH TEAM.

**T**HE team to represent Holland in the English-Dutch Reliability Trial on August Bank Holiday has now been chosen, and we give the names of the selected riders below. It will be observed that British machines are well represented, the makes including Douglas, Rover, Rudge, Royal Enfield, James, and Humber.

**PRIVATE OWNERS.****CLASS A.**

G. Th. Arends (2 Vulkaan) | J. H. Nieuwenhuis (2½  
P. N. Jelsma (2½ Eysink) | Douglas)  
Reserves: Vict. Fonck (2 Vulkaan) and Ch. v. d. Bossche  
(2½ Douglas).

**CLASS B.**

J. A. v. d. Garde (3½ Rover) | R. J. Tellegen (3½ Rudge  
E. J. E. Maas (5-6 F.N.) | multi.)  
Reserves: D. de Roon (5-6 F.N.) and N. Ruyter (3½  
N.S.U.).

**CLASS C.**

H. Dieters (6-7 Phonomobil) | H. Daalmeyer (6-7 Cyclo-  
D. Croll (7 Indian sc.) | nette)  
Reserves: S. Eweg (4½ Minerva) and H. C. Dolk (5  
h.p. Peugeot).

**TRADE RIDERS.****CLASS A.**

Vulkaan Works (2 Vulkaan) | N. V. v/h. D. H. Eysink  
D. v. d. Mark (2½ F.N.) | (2½ Eysink)  
Reserves: M. Adler (2½ Humber) and J. Witmond (2½  
Royal Enfield).

**CLASS B.**

R. S. Stokvis and Zn., Ltd. | P. J. Adrian and Co. (3½  
(3½ Rover) | Eysink)  
Hugo Smit Ezn (3½ N.S.U.) |  
Reserve: H. J. van Rynstra (5-6 F.N.).

**CLASS C.**

J. L. Geidt (6-7 Cyclo- | J. Boots (6-7 Coronamobiel)  
nette) | C. Witteveen (3½ James)

Of the foreign machines the Vulkaan and Eysink are Dutch built; the former use the Z.L. engine, the latter their own. The Cyclonette is made by the Cyklon-Maschinen Fabrik, of Berlin, and was exhibited at the last Olympia Car Show. It is a front wheel driving and steering tricycle, with sociable seats and twin-cylinder engine placed over the front wheel.

A. Howie and the T.T. Rudge, on which he won a road race from Orange Grove to Pretoria and back, sometimes called the "Motor-cycle Derby" of South Africa—Howie's time was 1h. 8m. 37½s.

## Some Features of T.T. Models.

THE Alcyon machines have many interesting points. Chief amongst them is the engine, which has two inlet valves and two exhausts, the stems of the valves being inclined at an angle of  $30^\circ$  with the horizontal. The combustion chamber is in section almost hemispherical, and the plug is accommodated in the middle of the head. The tappets are carried in brackets held down by bolts direct to the cylinder head, and have large bearings. In common with those on most French engines the valves and valve springs are exceedingly light.

The Riviere two-speed hub gear.

There are two separate long exhaust pipes fitted to Slatter's machine, but Stoeffel's has his short ones terminating in a box fitted immediately in front of the crank case. The bore and stroke of the engines are  $65 \times 105$  mm., the longest stroke used in the T.T. For all that, the engine does not look at all unwieldy. On the pulley side of the engine is a six to one reducing gear in an oil proof aluminum case; from this a cross shaft

Change-speed lever and chain of Bramoton's variable pulley gear.

Extra air inlet extending rearwards which is largely fitted to the T.T. racers.

Valve mechanism of the T.T. Alcyons.

is taken through the bottom bracket, and the final drive to the back hub from the bracket is by chain. On Stoeffel's machine a kick-starter is fitted, consisting simply of a pedal and free wheel on the counter-shaft, and this seems to work very well indeed. The back hub contains a two-speed gear known as the Riviere. It is certainly a very neat and quite light-looking job, and works on the epicyclic principle. The brakes for this gear are entirely enclosed. The clutch is operated by a pedal on the left footrest, and the change-speed by a small lever on the handle-bar. The engine can be started with the back

Scott silencer as fitted to the T.T. machines.

Safety peg on the Armstrong three-speed gear lever of R. Ellis's  $2\frac{1}{2}$  h.p. N.U.T.

wheel on the ground. The lubrication on Stoeffel's machine is combined drip feed and pump. A large oil tank is placed close by the saddle and discharges through an adjustable sight feed on the timing gear case to the crank-chamber. On Slatter's machine, pump feed only is fitted, and, indeed, it differs in a good many respects from the other. For

An effective type of rear brake.

instance, really good brakes are fitted, and an Amac carburetter. The accompanying sketch shows what a French racing man considers an ideal form of brake. It is simply a piece of copper tube bent into a circle threaded on a steel wire, attached *à la* aeroplane, and passed round a drum. The wire is connected direct to the pedal. As a means for pulling the machine up, this crude device certainly acts most effectually, but does not appeal to English motor cyclists. It is in matters of this kind that Mr. G. N. Higgs is so discriminating—he knows the little weaknesses of French manufacturers, and he takes good care that they do not figure on his Alcyons.

The pedal brake on J. R. Haswell's Triumph.

The double brake pedal on Hugh Mason's  $3\frac{1}{2}$  h.p. twin Matchless-Jap.

# Ascending Bwlch-y-Groes (Dinas Mawddwy side)

Noel Brown (2½ h.p. Hazlewood) half-way up the Pass.

AS mentioned last week, about thirty members of the Liverpool A.C. recently attempted Bwlch-y-Groes. The start was 200 yards below the hairpin bend, which proved too much for about half the riders, and most of the remainder were stopped by the loose stones near the top. In addition to those already mentioned as having made successful climbs, C. Hobbs, riding Philpott's 2½

A 7 h.p. two-speed Indian, with passenger on the carrier, one-third of the way up.

the cover of the magneto contact breaker, and had to tie the spring down with string.

Eleven solo riders have now accomplished the climb—those previously mentioned and also F. W. Newsome (Triumph), S. Wright (3½ h.p. Humber), A. S. Lloyd (Triumph), and M. Glasgow (Triumph). Two sidecar drivers have also been successful, R. Lord (6 h.p. Rex sidette) and J. Mills (6 h.p. Epfield sidecar).

We are, of course, referring to ascents of the Bwlch-y-Groes pass on the more difficult side, viz., that nearest Dinas Mawddwy. The climb begins in the Dovey Valley near Pont-y-Pennant, and rises nearly 1,200 feet in about two miles.

S. W. Philpott (2½ h.p. twin Humber) above the hairpin corner

twin Humber, also made a clean ascent, and J. Edge, who borrowed a similar machine and rode 100 miles to the hill, did the same, but unofficially. Noel Brown (2½ Hazlewood) took a passenger up on his carrier for about half the distance, stopped and dropped his passenger, and then successfully completed the ascent without assisting his engine in any way, but time did not permit a solo attempt being made, in which the feet must not touch the ground during the climb if the rider is to qualify for a silver medal.

Mrs. Baxter, the only lady to attempt the ascent, rounded the bend successfully, but failed to reach the top. On going down for a second attempt she lost

## OCCASIONAL COMMENTS.

By "IXION."

**The Future of the T.T.**

Nobody can doubt that the T.T. races still play a very valuable function in the design of motor cycles. A prolonged road race provides more information both in regard to theoretical design and practical metal-  
 rigry than any other kind of test; and if we were able to consult the interests of the pursuit, viewed either as a sport or as an industry, the future of the T.T. would be assured.

As a matter of practical politics, however, the future of the T.T. is primarily a financial question. Few can seriously criticise the trade for signing an abstinence bond. The expense of competing is extraordinarily heavy, and the race withdraws the cream of a factory testing staff from headquarters at a time when their presence is urgently needed.

Several firms have a long start of the rest in racing experience, and only the winners can hope to recoup themselves for their outlay. Price competition is excessively keen nowadays, and shareholders have to be considered.

The real question is whether the expenses of future races can be approximately balanced without the aid of sixty or more heavy trade entry fees; and the answer lies with amateurs; partly with the racing amateur, who is willing to compete at heavy expense to himself (I rule out the shamateur), and partly with the tourist amateur, who is willing to subscribe a guinea or so to assist the evolution of the industry, and to provide himself and his friends with a very sporting spectacle.

Shamateurism can only lead to a stiffening of the trade bond, or other restrictive measures; paucity of public subscriptions will saddle the A.C.U. with a heavy loss. The repetition of the race is certainly in jeopardy at present; and I should not be surprised if a 1913 race were made dependent on large guarantees from the motor cycling public. I imagine there must be a deficit on the 1912 races; that the trade will again formally abstain in 1913; and that the A.C.U. cannot continue to make a loss indefinitely.

**Handle-bar Control of Clutch and Gear.**

Wherever motor cyclists meet, there has lately been much controversy about the proper location of clutch and gear controls. From every point of view opinions appear fairly unanimous, that if the gear be foot controlled it should be of a type where the clutch is embodied with the gear, as at starting it is helpful to "leg" the machine, both to ease the pick-up with a poor clutch or uphill, and to balance the machine.

I see no reason whatever why all separate gear controls should not be immediately transferred to the handle-bar. There is nothing I loathe more than having to dive under the flaps of my waterproof jacket to find a gear lever, while I am simultaneously hard pressed to keep the machine vertical on a stony hair-pin, and to set the carburetter levers accurately for a clean pick-up round the bend. Moreover, there is very little strain on the control of a well-designed modern gear; old-fashioned gears certainly required some pressure and a great range of lever travel, but the up-to-date gear is usually no more awkward to operate than an ignition switch.

It appears to me inevitable that before long all separate gear controls will be on the handle-bar. The question of the clutch control is less simple. There is invariably a severe strain on the connections, and a very substantial lever and bracket would be necessary. I have had heartrending experiences with flimsy h.b. clutch controls which stripped, twisted, broke, and stretched wires. I very much prefer the h.b. clutch control for starting, but for momentarily freeing the engine when negotiating a bad bend the pedal is more suitable, as any manipulation of a handle-bar lever requiring some strength is apt to upset the steering. On the whole, my vote would be given at present to hand control for the gears, and foot control for the clutch.

**A Needed Legal Reform.**

No doubt many motor cycle journalists desire a small reform in the registration laws, the need of which is frequently brought home to me. Manufacturing concerns are continually sending me machines on loan asking my opinion on some engine, frame, carburetter, or gear. The registration laws forbid them to provide me with trade numbers.

The factory tester brings the machine with red numbers clipped over black blank plates; arriving at my house he leaves me numberless, slipping the red plates in his pocket. I am not supposed to use my private numbers for two different machines; either simultaneously or consecutively, but it is absurd to ask me to register a machine that is lent to me for a week.

Consultants and journalists surely require a special clause in the registration orders, permitting them to hold an "omnibus" number at a slightly increased fee, so that they can attach it to any machine temporarily entrusted to their hands.

## TIME TO LIGHT LAMPS.

July 4th	...	9.16 p.m.
" 6th	...	9.15 "
" 8th	...	9.14 "
" 10th	...	9.13 "

## Police Traps.

Motor cyclists riding on the road between Manchester and Huddersfield are advised to go very carefully through Failsforth.

## No Motor Cycles at the Paris Salon.

Motor cycles will not be exhibited at the Paris Salon this year. At the conclusion of a long article, in which it voices its displeasure upon this deplorable state of affairs, *La Revue de l'Automobile*, an important French technical journal, says: "We have touched upon almost virgin soil, on which we have worked and fertilised, and have sown with good seed, full of promise for the harvest; now the fruits are ripe, we retire hat in hand before the English, who come to gather in the results of our labours. Poor France!"

## Grand Prix de Turin.

The results of the above Italian 100 kilometres road race, held on the 16th ult., are:

Class I. (250 c.c.).—Luschi (S.I.A.M.T.), 1h. 48m. 41½s.

Class II. (250 to 334 c.c.).—Rava (S.I.A.M.T.), 1h. 29m. 53½s.

Class III. (334 to 500 c.c.).—D. Ferrera (Ferrera), 1h. 11m. 15½s.

Class IV.—Bellorini (Ferrera), 1h. 16m. 36½s.

The team prize, awarded to the fastest complete team, was gained by Scales, and two Italian riders on S.I.A.M.T.'s. Mr. Scales is the son of the manager of the London agency for this machine.

Thirty-nine started, and the fastest time gives a speed of 52.33 miles per hour.

## Auto Cycle Union Notes.

**THE DEFINITION OF A PRIVATE OWNER.**  
—This matter is receiving earnest consideration at the hands of the Auto Cycle Union. One rider whom the Union has reason to believe is not a *bona-fide* amateur will be, in future, refused entry to competitions as a private owner, and a meeting will be called in the Midlands shortly at which manufacturers and club secretaries will be invited to attend to discuss this important matter thoroughly.

**MEMBERSHIP.**—Since the last meeting of the committee, twenty full members and 395 touring members have been elected. 148 members have been brought in by clubs newly affiliated, and 256 through increase of membership of clubs already affiliated. This makes a total increase of 819.

## Scottish Auto Cycle Union and the A.C.U.

Formal notice is being given to terminate the agreement between the A.C.U. and the Scottish Cyclists' Union, and an agreement will shortly be entered into between the Auto Cycle Union and the new Scottish governing body.

## Stolen Machines.

The two Rudge multis mentioned last week as having been stolen from a garage at Stamford Hill have been recovered. They were traced to a stable at Edgware, and the thief has been arrested. Two other motor cycles were found with them.

## British Motor Cycles in Canada.

British motor bicycles scored heavily in the Toronto Motor Cycle Club races, on the half-mile dirt track at Toronto, Canada, on Saturday, June 8th, which were witnessed by 11,000 people.

N. Newport (Triumph) captured two events, a five mile private owners' race

FUTURE EVENTS	
July 6.—Dublin M.C.C. Open Hill-climb	
" 15.—Irish Open End-to-end Reliability Trial.	
" 18.—Oxford M.C.C. Open Speed Trials.	
" 20.—B.M.C.R.C. Race Meeting.	
" 20.—Liverpool A.C.C. Open Speed Trials.	
" 20.—South Wales A.C., and Cardiff M.C. Open Hill Climb at Caerphilly.	
" 27.—R.A.C. Associates' Gala Day at Brooklands.	

and a five mile "Tourist Trophy" contest. Triumphs also finished second and third in the former race, while in the latter Newport won from several American mounts. Newport's best time was 7.13m.

A feature of the meet was the riding of Bob Barton (Rudge), who travelled exceedingly well, but whose chances were spoiled by spectacular spills. Barton found it rather difficult to negotiate the turns on the small oval, but showed considerable nerve and skill nevertheless.

The first sidecar race ever put on in Canada, was run off at this meet, the result being entirely in favour of British motor cycles. Percy Barnes (Triumph), the winner, rode the three miles in 5.03m., with A. F. Astley (Triumph) second, and M. Amoss (Rudge) third.

The big twenty-five mile race was won by Harold Cole, the seventeen-year-old Canadian champion, on an Excelsior. Cole rode twenty-five miles in 30m. 54½s., establishing a new Canadian record

## SPECIAL FEATURES.

## TOURIST TROPHY RACES.

Detailed Illustrated Description.

## EXPLORING EXMOOR.

## Proposed Amateur Motor Cyclists' Association.

A meeting will be held at the A.C.U., 89, Pall Mall, W., to-morrow evening, Friday, at eight o'clock, to discuss the question of the formation of an amateur motor cyclists' association. Mr. H. P. Harding will be in the chair. Further particulars can be obtained from Mr. C. C. Cooke, Rose Cottage, North Mumps, Hatfield, Herts.

## Army Manœuvres, September, 1912.

At the request of the War Office, the A.A. and M.U. (Motor Cycle Section) is arranging for sixty motor cyclists to serve as despatch riders with the Blue Force from the 14th to 20th September. The allowances, etc., will be as follows: (a.) Third class railway fares for cyclists and conveyance of their motor cycles between their homes and the manœuvre area. (b.) Cost of messing in camp, or a subsistence allowance at the rate of 8s. per diem (in lieu of payment of bills for food and lodging at hotels). (c.) Special allowance of 8s. per diem, not including days on which train journeys only are performed, to cover cost of petrol and upkeep of motor cycle, including insurance of machine against accidents. All motor cyclists who are willing to volunteer for service are kindly requested to send their names to the A.A. and M.U., Caxton House, Westminster, S.W., as early as possible.

## Paris-Liege Run.

A sporting French newspaper, *L'Aero*, and the *Journal de Liège*, are organising a 250 miles run from Paris to Liège on the 7th inst., under the auspices of the Moto-Club Liégeois, and under the general rules of the A.C.F. A hill-climb will take place at Bouillon, which will be decided on A.C.U. formula. Every competitor who reaches the destination with full marks will receive a gold medal from *L'Aero*. Several other cups and prizes are offered. The route (which must be ridden in a day) is: Rheims, Sedan, Bouillon, Paris, Laroche, Aywaille, and Liège. The entries stand as follows: N.S.U. (eleven machines), Sarolea (eight), F.N. (seven), Alcyon (four), Rudge-Whitworth (three), Scaldis (one), New Hudson (one). Seventy entries are expected.

The minimum speeds for sidecar machines have been reduced from 36 to 32 kilometres an hour, so as to give the 3½ h.p. machines a chance. Special arrangements are being made to enable foreign competitors to take part without the necessity of paying Customs deposits.

## THE JUNIOR RACE.

### Examination of the Machines.

### Meeting of Competitors and Officials.

ON Thursday morning the competitors in the Junior Race met at Woodlands, where in a field adjacent to the main road the machines were arranged, each with its back wheel opposite a post bearing its number. The duty of making the examination was vested in a committee of officials who had agreed to undertake this work. This committee consisted of Messrs. L. A. Baddeley, A. V. Baxter, S. W. Carty, H. W. Fortune, G. A. Gregson, F. Scriven, and A. H. Priestley, under the leadership of Capt. A. H. Davidson, R.E. But of this number only the chief examiner and Messrs. Priestley and Baxter turned up; consequently the whole of the work fell into the hands of these three, who were aided by Mr. E. P. Greenhill. In all cases save two, the front and back wheels and frame were sealed, the two exceptions being the Alcyons, the

engines of which bore no number. Besides the N.S.U.'s the only absentee was Hugh Mason's  $2\frac{3}{4}$  N.U.T., fitted with the only  $2\frac{3}{4}$  overhead twin J.A.P. engine in existence. Mason had finished his practice successfully, and on his way to the garage his frame came to grief.

In the evening there was the usual meeting of competitors and marshals, who were addressed by Mr. J. R. Nisbet, the clerk of the course. In addressing the former, Mr. Nisbet urged them to turn up punctually and to drive with due consideration for one another. He pointed out that only one helper was allowed to each machine at the depots, who might only give assistance in the distribution of oil, petrol, water, covers, or tubes. Spare belts, if wanted, had to be carried. A post at Keppel Gate, though apparently not really dangerous, had been painted white.

Scene at the start. P. J. Evans ( $2\frac{1}{2}$  h.p. Humber), last year's winner, the first to start. He suffered ill-luck.

### The International Motor Cycle Tourist Trophy Races.—

He also announced that competitors would be despatched singly at one minute intervals. A few questions, asked by competitors, were satisfactorily answered. The marshals then received their instructions. A question concerning the size of the Douglas engines was brought up during the afternoon, as the capacity, worked out on the dimensions given (61 x 60 mm.), gave a slight excess over 350 c.c., but it was pointed out that 61 mm. was the nearest metrical equivalent and that actually the cylinders were to size. The engine sizes could, if necessary, be verified after the race.

### The Day of the Race.

Friday morning was beautifully fine, and the weather looked distinctly better. The sun shone through the clouds and a light westerly breeze was blowing. There were mist and rain on the mountains, however, and it looked rather threatening to the westward. Later on, just as the men were lining up for the start, there came a torrential downpour which looked like lasting, but ere the lap was completed it cleared up, and remained beautifully fine for the rest of the day. Petty and O'Donovan were the first riders on the course. The arrangements were excellent. The depot close to the timing box was provided with two heaps of sand and two shovels in case of fire. Every facility was given to the press, the scoring board was admirably worked by Mr. A. H. Priestley, while it goes without saying that Mr. J. R. Nisbet made an excellent Clerk of the Course. It might almost be said he was better than usual, as, thanks to the excellent secretarial work done

by Mr. T. W. Loughborough and Mr. H. P. Beasley, his assistant, the clerk of the course was able to throw his whole energy into the duties he was specially appointed to carry out. As the time for starting approached, the competitors were arranged in order of starting in Selburn Road, just off the course. The police exercised their duties in a tactful and excellent manner, while one constable was seen pinning a badge on a competitor. Col. Madoc, the Chief Constable of the Island, who watched the race from the timing box, first went round the course, taking with him Mr. A. H. Cubbin, secretary to the Highway Board, who told us he had found the roads in quite good condition, except in one or two places. Stoeffel and Slatter were rather late arrivals, but both started. They were mounted on four-valve machines, and Stoeffel's engine had a Gobi carburetter, a new French make much patronised by aviators. These carburetters, Stoeffel told us, are automatic, and not sensitive to change of temperature.

As reported previously, there were four absentees—the three N.S.U.'s and Mason. Just before ten o'clock Mr. Nisbet and the two timekeepers, Messrs. A. V. Ebbelwhite and F. T. Bidlake, took up their positions in the pouring rain, and at ten precisely Evans, last year's winner, was given the word to go, amid the cheers of the spectators. His engine appeared to misfire at the start. Bailey, the hope of Australia, got away in splendid form. Kickham, another rider of a Douglas, Harrison Watson, and Newman also started well.

Ellis, while the timekeeper was counting out the seconds before he had to start, had his attention called to a loose terminal on his magneto, and he was still gazing at it when the word to go was given, consequently he lost two minutes. Having fixed the terminal, he went off with his stand down, and had to stop to fasten it up. Stoeffel came

James Stewart of Belfast (Douglas), fourth to finish, chatting with Noel E. Drury, an old T.T. rider, also from the Green Isle.

E Kickham (Douglas) on the bend at the summit of Bray Hill.

Robt. Ellis (2½ h.p. N.U.T.-Moto-Reve) after descending the mountain road.

3½ h.p. single  
cylinder N.S.U.

## Where they score

is in that extra efficiency and endurance which are the result of an experience extending over the entire period of motor cycle development. You can feel the superior quality of the N.S.U.'s running on the very first run, but it is only after many many miles have been covered that you arrive at a true appreciation of its sterling worth. There is a *certainly* of satisfaction in the N.S.U. you cannot find in any other. The four N.S.U. models meet all requirements and each is equipped with all the most approved features. Write to-day for particulars.

**The International Motor Cycle Tourist Trophy Races.—**

up with a newspaper over his machine to keep the rain off. At the word "Go!" his carburetter caught fire, but J. Griffiths saved the situation with his cap. The healthy bark of W. H. Bashall's Douglas as he left the starting line was most remarkable, and the engine told its tune in no uncertain tones. Owen was late starting, as he had to tighten his belt. Creyton went off on one cylinder, and as he disappeared from view the rain stopped, much to everyone's relief, and the weather began to improve. After an interval news began to filter slowly through the telephone.

**Bailey Leads in the First Lap.**

At about 10.40 it was announced by Mr. Nisbet on the telephone that Bailey had passed Ramsey, while Kickham, Newman, Watson, and Bashall were not far behind. Then it was announced that Watson had broken a belt near the above named town, and a little later that Bailey, and after him Kickham, had passed the Bungalow. The excitement rapidly grew, and presently Bailey flashed by the timekeeper's box with a spare belt dangling dangerously from his luggage carrier. Kickham stopped at the depot for replenishments. This he did every lap, and thereby lost considerable time. Shortly after Bailey had gone by a clicking was heard in the timing box for several seconds.

P. W. Owen (Forward) at Hilberry Corner. He finished fifth.

Major Lloyd, who was acting as timekeeper's auditor, ticked out a lightning sum on his calculating machine, and announced that Bailey had covered the lap at a speed of 38.03 miles an hour. These announcements added greatly to the interest of the race, and were much appreciated by those who heard them. The times and speeds in miles per hour at the end of the first lap were as follows:

		Lap speed	
		h. m. s.	m.p.h.
1.	S. L. Bailey (Douglas) ...	59 10	= 38.03
2.	W. H. Bashall (Douglas) ...	1 2 10	= 36.19
3.	H. C. Newman (Ivy-Precision) ...	1 2 34	= 36.06
4.	E. Kickham (Douglas) ...	1 2 56	= 35.85
5.	H. J. Cox (Forward) ...	1 10 28	= 31.93
6.	D. O'Donovan (Singer) ...	1 11 54	= 31.29
7.	P. W. Owen (Forward) ...	1 12 22	
8.	R. Ellis (N.U.T.) ...	1 17 5	
9.	E. V. Pratt (O.K.-Precision) ...	1 17 18	
10.	H. Petty (Singer) ...	1 23 29	
11.	J. Haslam (Douglas) ...	1 25 35	
12.	J. T. Bashall (Humber) ...	1 32 51	
13.	D. M. Brown (Humber) ...	1 46 2	
14.	R. G. Mundy (Douglas) ...	1 58 34	
15.	P. J. Evans (Humber) ...	2 4 29	

Bailey was travelling so well, his chances of winning seemed to be of the brightest, while Bashall, H. C. Newman, Kickham, Cox, and O'Donovan, whose machine had one of the smallest engines in the race, were all making good per-

D. R. O'Donovan (2½ h.p. Singer) at Ballig Bridge. This is the point where the machines usually leap off the ground, but the jumps were hardly perceptible in the Junior race.

formances. An idea of how well Bashall was travelling may be gathered from the fact that he started fourteenth and passed fourth in the first round, while Kickham, who started eighth, passed second. The muddy condition of the riders showed that the roads were wet and greasy in the more shady places on the course.

**Hopes of Australia and Manxland.**

News presently came to hand that Watson and Creyton were walking home. Eventually both arrived together at the depot, and told how both their machines had come to grief near Keppel Gate—Watson through timing gear trouble, Creyton through a seized engine. Bailey had stripped his gears at the hairpin bend near Ramsey, and now the chances of Manxland and Australia were lost. Poor France, who supplied the only two foreign-made machines,

H. C. Newman (2½ h.p. Ivy-Precision) speeding along the road to Woodlands. He was among the first three for two laps, but burst a tyre on the third circuit.

### The International Motor Cycle Tourist Trophy Race.—

was hopelessly out of it already, as neither Aleyon finished the first round.

The second lap order was as follows:

		Lap speed	
		h. m. s.	m.p.h.
1.	W. H. Bashall (Douglas) ...	1 59 1	= 39.58
2.	E. Kickham (Douglas) ...	2 1 59	= 38.10
3.	H. C. Newman (Ivy-Precision) ...	2 2 29	= 37.55
4.	H. J. Cox (Forward) ...	2 9 33	= 38.03
5.	P. W. Owen (Forward) ...	2 22 50	= 31.93
6.	R. Ellis (N.U.T.) ...	2 24 50	= 33.21
	E. V. Pratt (O.K.-Precision) ...	2 29 13	
	J. Stewart (Douglas) ...	2 30 1	
	H. Petty (Singer) ...	2 32 37	
	D. R. O'Donovan (Singer) ...	2 40 54	
	J. Haslam (Douglas) ...	2 52 6	
	J. T. Bashall (Humber) ...	2 52 14	
	P. J. Evans (Humber) ...	3 14 31	
	R. G. Mundy (Douglas) ...	4 24 21	

At this stage Kickham had his usual stop at the depot, but wasted no time there. Newman burst a tyre beyond Quarter Bridge, and then pushed and rode on the rim to Ballacrairie, thereby losing his third position. Ellis passed, going steadily. Then Stoeffel walked in, reporting he had

E. Kickham (Douglas) at the Gocseneck on Snaefell.

had a puncture and valve trouble. As the said valve took him two hours to dismount, he gave up. Slatter was reported to have had a fall. There was a long interval after the first three had come through.

The third lap results were:

		Lap speed	
		h. m. s.	m.p.h.
1.	W. H. Bashall (Douglas) ...	2 53 1	= 41.20
2.	E. Kickham (Douglas) ...	2 57 43	= 40.37
3.	H. J. Cox (Forward) ...	3 9 31	= 37.52
4.	P. W. Owen (Forward) ...	3 28 45	= 34.13
5.	R. Ellis (N.U.T.) ...	3 30 28	= 34.28
6.	J. Stewart (Douglas) ...	3 30 41	= 37.09
	H. Petty (Singer) ...	3 39 16	
	J. Haslam (Douglas) ...	3 57 1	
	E. V. Pratt (O.K.-Precision) ...	4 3 25	
	D. R. O'Donovan (Singer) ...	4 9 51	
	H. C. Newman (Ivy-Precision) ...	4 24 44	
	P. J. Evans (Humber) ...	4 32 8	
	J. T. Bashall (Humber) ...	5 6 26	

This was J. T. Bashall's last appearance, as sooted plugs and lubrication trouble, followed by a burst tyre on Bray Hill, which nearly resulted in serious consequences, put him out of the running.

Harold J. Cox (Forward) dropping down Bray Hill. The starting and finishing point is hidden among the trees in the background.

It was now time to expect the winner, and telephone messages from Ramsey, the Bungalow, and Willaston announced his progress, and that Kickham was close behind him. At last he came in sight and, going as well as ever, passed the line amid the cheers of the spectators, while Kickham came in second by 4m. 37s. The crowd immediately became somewhat too anxious to get on to the course, but the stentorian voice of the clerk of the course through the megaphone, followed by a sharp rebuke to the marshals to do their duty, incited the latter to act promptly and keep the people off the road. Just after he came in Bashall's machine was pushed off the course by Mr. Albert, followed by Captain Nicholl, to the examination yard, while

ALL SMILES The two leaders, W. H. Bashall and E. Kickham—both amateurs—shaking hands at the finish. They rode 2½ h.p. Douglas machines, and were separated by 4 min. 37 secs. only.

RELIABLE ACCESSORIES AT  
LONDON'S LOWEST PRICES

## GREAT BARGAINS IN TYRES.

Having purchased a manufacturers' stock of new Covers and Tubes, we are able to offer the following makes at greatly reduced prices.

Clincher A. Won rubber-studded covers, 26 x 2 1/2 in., 29/11, usual price 31/7. Westwood rubber studded, 26 x 2 1/2, 23/11, usual price 30/6. Westwood heavy tri-car, 26 x 2 1/2, 35/-, usual price 47/-; ditto, 26 x 2 1/2, 38/6, usual price 57/-. Clincher Inner Tubes, 26 x 2, 6/11, usual price 11/4. Westwood, 26 x 2 1/2, 7/3, usual price 9/9; ditto, heavy tri-car, 9/3, usual price, 11/9. All New Goods. Postage on covers, 8d. extra, tubes 4d.

## THE HUNT NEW MODEL COMPACT VALISE.

Length, 18in.; width, 11in.; depth, 6in. Manufactured of finest cowhide. Strengthened inside with strong hide-covered metal bands, and at the bottom with two wood batons which prevent bag being chafed by carrier. The inside is lined with a strong twill, and the outside is fitted with two spring lever locks and handle. The bag is strongly riveted throughout, and it is impossible for it to lose its shape. The handle enables it to be also used as a Suit Case. Fitted with two leather straps 48x7/16 in. for attaching to carrier. The motor cyclist can carry sufficient clothing inside this case to last him for a fortnight's tour. On arriving at his hotel, the bag can be taken to his room as an ordinary portmanteau. Finished in dark nut-brown leather. Price 30/-.

## THE WESTWOOD specially prepared Repair Bands.

For use on outside of cover after same has burst or been gashed. The outside edges are tucked inside rim, i.e., between rim and cover. Price 1/-, postage 2d. Ditto for inside, 8d.

The Hunt Hellenas Dry Cell. No corroding terminals. No acid. No charging. Always ready, clean, and dry. The "Flash." Height 6 1/2 x 4 1/2 x 2 1/2 in. Approx. mileage with single cyl. engine, 1,500. Price 6/6. The "Flash" ditto. Height 5 1/2 x 3 1/2 x 2 1/2 in. Price 6/6. The "Midget" emergency ditto. Height 5 1/2 x 4 1/2 x 1 1/2 in. Will run approx. 300 miles. Price 4/4. Postage 8d. extra.

## THE HUNT EXCELSIOR WATCH AND HOLDER.

Weather and dust-proof case. Watch guaranteed to stand vibration. Can be wound and adjusted without removing from the case or handle-bar. For attaching to the handle-bar. Price 5/6. Postage 2d.

## THE HUNT Valve Spring Remover.

By means of the compound action the stoutest spring is easily raised by a slight turn of the aligned nut, leaving both hands free.

Price 2/6. Postage 2d.

## 1912 MODEL SIDECARS in stock for Immediate Delivery.

THE HUNT 1912 IMPROVED MODEL (in stock).

Upholstered wicker chair, cushion, detachable clips, 26 x 2 1/2 in. tyre. A strong and reliable sidecar at a popular price, stocked to fit all motor cycles.

Price £5 15s.

MILLFORD SIDECARS (in stock).  
1912 Herald, improved model ..... £6 6 0  
1912 Rigid Model, with wicker body ..... £9 9 0  
1912 Rigid Model, with coach-built body ..... £16 7 6  
1912 Radial Castor Model, with wicker torpedo body ..... £13 13 0  
CHATER-LEA SIDECARS (in stock).  
1912 Standard Model, with wicker body ..... £8 0 0  
1912 Coach-built Model ..... £10 17 6

SIDECAR BODIES (in stock).  
No. 1, Wicker Body, upholstered ..... £1 10 0  
No. 2, extra strong, ditto ..... £2 0 0  
No. 3, Torpedo type, art cane body, upholstered ..... £3 5 6

No. 3 Model.

Any make of Motor Cycle or Sidecar supplied to order.

The H.S. All-rubber Goggles, including one set each of smoked and plain glasses, Price 1/9. Postage 2d.

## THE HUNT MAGNETO KNIFE. A useful little tool.

FILE: For smoothing down Platinum Points to secure even contact. GAP: GAUGE for setting Platinum Points correctly. KNIFE: The utility of which every motorist will appreciate. Price 1/- Postage 1d.

## THE HUNT "ANTARNISH."

A non-greasy, weatherproof, and IN-VISIBLE Lacquer for applying to the plated parts of Motor Cars, Cycles, etc., and also to bare clean steel, brass, or any other metal. Price per tin, 9d. Postage 3d.

## THE HUNT "ROSCO" CYLINDER PAINT.

Keeps the engine cool, prevents overheating, produces a smooth dead black surface. Unaffected by heat or water.

Price per tin, 6d. Postage 2d.

## THE HUNT

Motor Cycle Box Spanners.

Containing six sizes, with tommy. English manufacture. Guaranteed.

Sizes 3/2, 3/2, 1 1/2, 2, 2 1/2, 3 in. Price 2/6 set, postage 3d.

## SPEED INDICATORS.

All Speed Indicators fitted free.

The Cowey registers from 5 to 40 and 10-65 miles per hour. Price £4/4/0.

The Stewart registers up to 60 miles per hour, £2/15/0, ditto with Trip Recorder, £3/10/0. The Jones registers up to 60 miles per hour, £3/3/0, ditto with Trip Recorder, £4/4/0.

"COVEROLE." For Repairing Leaky Petrol Tanks, Pipes, Unions, etc.

DIRECTIONS.

For Worn Unions.—Paint the treads and cone liberally with Coverole, screw up tightly, and give a final application to the outside.

For Cracked Pipes, etc.—Smear a piece of paper, canvas, tape, or similar material with Coverole, and wrap tightly round the pipe. Price 1/- Postage 2d.

## THE H.H. HUNT BELT PUNCH AND CUTTER.

Both the cutter and punch are easily removable for sharpening, and either can be immediately renewed at the cost of a few pence—this is an advantage not to be obtained in any other punch.

Suitable for all size belts.

Price 5/- Postage 2d.

## THE HUNT TOOL BAG.

Size 9 1/2 x 5 x 4 1/2 in.

With Pockets for Oiler Plugs and Springs.

Price 7/6. Postage 4d.

100 page illustrated catalogue post free.

**COLONIAL AGENTS!**

The best motor cycle for  
your requirements is the

# REX-JAP

In the 1912 REX-JAP motor cycle, we have endeavoured to produce a motor cycle that will give satisfactory service under all conditions—a motor cycle with the speed, power, hill-climbing ability, and reliability so essential for comfortable touring—and the letters of appreciation we are receiving every day from PRIVATE OWNERS prove that our effort has been successful.

**OUR AGENCY PROPOSITION**

will interest every Colonial Dealer—we shall deal direct with the Agent—and cannot consider applications from Merchants or Factors. With regard to delivery, upon receipt of order, by letter or cable, we can ship any model within three weeks.

—May we send you a supply of Catalogues and Literature, and our special Agency Terms?

## THE DIFFERENCE BETWEEN PALMER CORD & OTHER TYRES

shows itself in the mileage. Read the following  
letter, which is a typical example of :: :: :: :: ::

# PALMER DURABILITY

Plymouth, March 7th, 1912.

Extract of letter from A. E. DYSON, Esq.

I have since done 8,000 miles, not 500 of which distance has been done without sidecar, and am only now fitting a new cover owing to a gash in wall of tyre through riding over a lot of unrolled stones in the dark. I have had about five punctures, and I should think, bar the gash, the tyre would be good for at least another 1,000 miles on back wheel. Anyway, experience is the best test, and in future you may depend my tyres will be Palmers. Bear in mind our Devonshire and Cornish roads are not level tarred roads as around London, but in the majority of cases are very hilly with a loose granite surface.

Write for Price List of 3 grades of Palmer Motor Cycle Tyres and the Privateer.

**The Palmer Tyre, Ltd.,**

## The International Motor Cycle Tourist Trophy Races.—

soon after Captain Davidson, the Rev. E. P. Greenhill, and Major Lindsay Lloyd, with the measuring instruments (which, by the way, are the invention of Mr. T. W. Loughborough), followed.

an excellent sportsman, and it is good to be able to record his win. He is quite impartial as to his choice of makes, as he rides all kinds of machines, and does not continually pin his faith to one firm. Of the two Forwards entered both finished, one third, and the other fifth, while Cox has

The winner, W. H. Bashall (2½ h.p. Douglas), crossing the finishing line. His average speed throughout was 39.65 m.p.h. The excellent lap scoring board is plainly discernible on the left.

Soon after it was announced that the victorious Douglasses did not exceed 350 c.c., which statement was received with cheers. To Kickham went the honour of having made the fastest lap, as he had covered the fourth round at the rate of 41.76 miles an hour, while Bashall's lap had been covered at the rate of 41.23. Truly we owe a debt of gratitude to Major Lloyd for bringing his calculating machine with him, thus enabling the speeds to have been so promptly given out.

The win was a most popular one. We are intimately acquainted with Douglas machines, both past and present, and are thus fully *au fait* with their worth. We have followed the progress of the firm since its earliest days. It has deserved success, and we are delighted that success has been obtained. W. H. Bashall is a keen amateur and

now held third place for two years running. Petty, on one of the smallest engines in the race, came in seventh, and his Singer was the first of the single-cylinders to finish. Newman had indeed hard luck, and but for his burst would have probably finished high up in the list. Evans, last year's winner, had more troubles than he could remember, but he stuck gamely to his task, and the fact that he finished earns him our congratulations. Ellis at one point during the race lost all the screws out of his timing gear case except two. He cut some wood plugs and fitted them in the holes to replace the screws that were missing, and the fact that he finished sixth is proof that he wasted no time. This is a very good example of British grit and perseverance.

\*Fastest lap.

## IMPRESSIONS OF THE RACE FROM QUARTER BRIDGE.

**L**AST year Quarter Bridge was considered to be the most difficult and dangerous corner on the course, as it possesses a right-angled bend immediately following a fairly steep descent from Woodlands. Lately the Manx Highway Board have at considerable expense widened the road over the bridge, and though competitors in practice had taken liberties as a consequence, the cornering at Quarter Bridge was conspicuous for the care displayed. A big crowd assembled at this point.

**The First Fall.**

In the very first lap M. Stoeffel (Alcyon), who, by the way, could not speak a word of English, dashed up to the corner without slackening speed and fell heavily. This was surely a bad start less than a minute from the word "Go," especially as his machine caught fire momentarily at the start, and he was very slow in getting away by means of the clutch. Bailey (Douglas), who started favourite, Harrison Watson (Humber), Newman (Ivy-Precision), Cox (Forward), and Harry Bashall (Douglas) were among the best corner men. J. Stewart (Douglas), the Irish rider, and Robert Ellis (N.U.T.-Moto-Réve) took matters very steadily, and did not encroach beyond the centre of the road—which perhaps was a good fault.

excitement naturally ran high among a little party consisting of the Messrs. Douglas, Armand, and others at Quarter Bridge.

Cox was going splendidly, but his riding position, with back almost erect, caused some comment. One could hardly believe that Bashall could have stopped six times and yet obtained second position. An idea of the wet state of the roads was gained by the bespattered condition of the competitors and their machines. There was again a long interval, and great surprise was evinced at the absence of the Humber team. These riders, it was subsequently learned, were the victims of extraordinarily bad luck, Evans, for instance, the most fancied rider, having a number of stops for plug, belt, and tyre troubles.

**A Long Wait.**

Then followed four or five riders, but the thinning of the ranks had robbed the race of a great deal of interest, and the ordinary spectator was getting bored. This state of affairs got worse as time progressed, for the gaps became longer and longer, and the riders still in the running fewer and fewer. The crowd became somewhat careless, and resented the appeals to keep the course clear whilst no rider was in sight. Bailey was anxiously awaited, as the time he was due passed by but Kickham had gained the lead.

Harry Bashall (2½ h.p. Douglas) at Quarter Bridge, where a big crowd collected. Observe the condition of the road on the first two laps.

Most of the three-speed riders changed to the middle gear on approaching the corner, mainly in order to get away more quickly on releasing the valve lifter.

**Where Some Riders Failed.**

Some were very tardy in picking up speed, and undoubtedly the majority were too anxious to get in the top gear. The winner was a notable exception; he kept his low gear in and raced his engine until it attained a continuous buzz; certainly the speed would be 30 m.p.h. before the high gear went home.

Reports came to hand that Stoeffel had stopped again near Braddon, and a mile or two further Slatton had an enforced stop. There was a long period of waiting after all the starters had gone by, and in some ways it was unfortunate that the course was so long and the competitors so few. At last the riders came round again, but in much slower time than had been expected. The sticky state of the roads between Quarter Bridge and Ramsey troubled them a great deal. Bailey, the Australian, was first round, having passed Evans, the Junior T.T. holder; then followed Kickham, who started eighth and had stopped at the Woodlands depot; Newman, on the single-cylinder Ivy-Precision, and Bashall, the fourteenth; and, after a gap, Cox (Forward). Douglas riders had thus gained an early and convincing lead, so

hotly pressed by young Newman, whose reputation for winning hill-climbs had gained him many admirers. Next came Bashall, Cox, Petty (Singer), Ellis (N.U.T.), Stewart (Douglas), and Owen (Forward).

**Speed and Reliability of the Twins.**

The twins were demonstrating their speed and reliability thus early, for only two single-cylinder riders were now in the running.

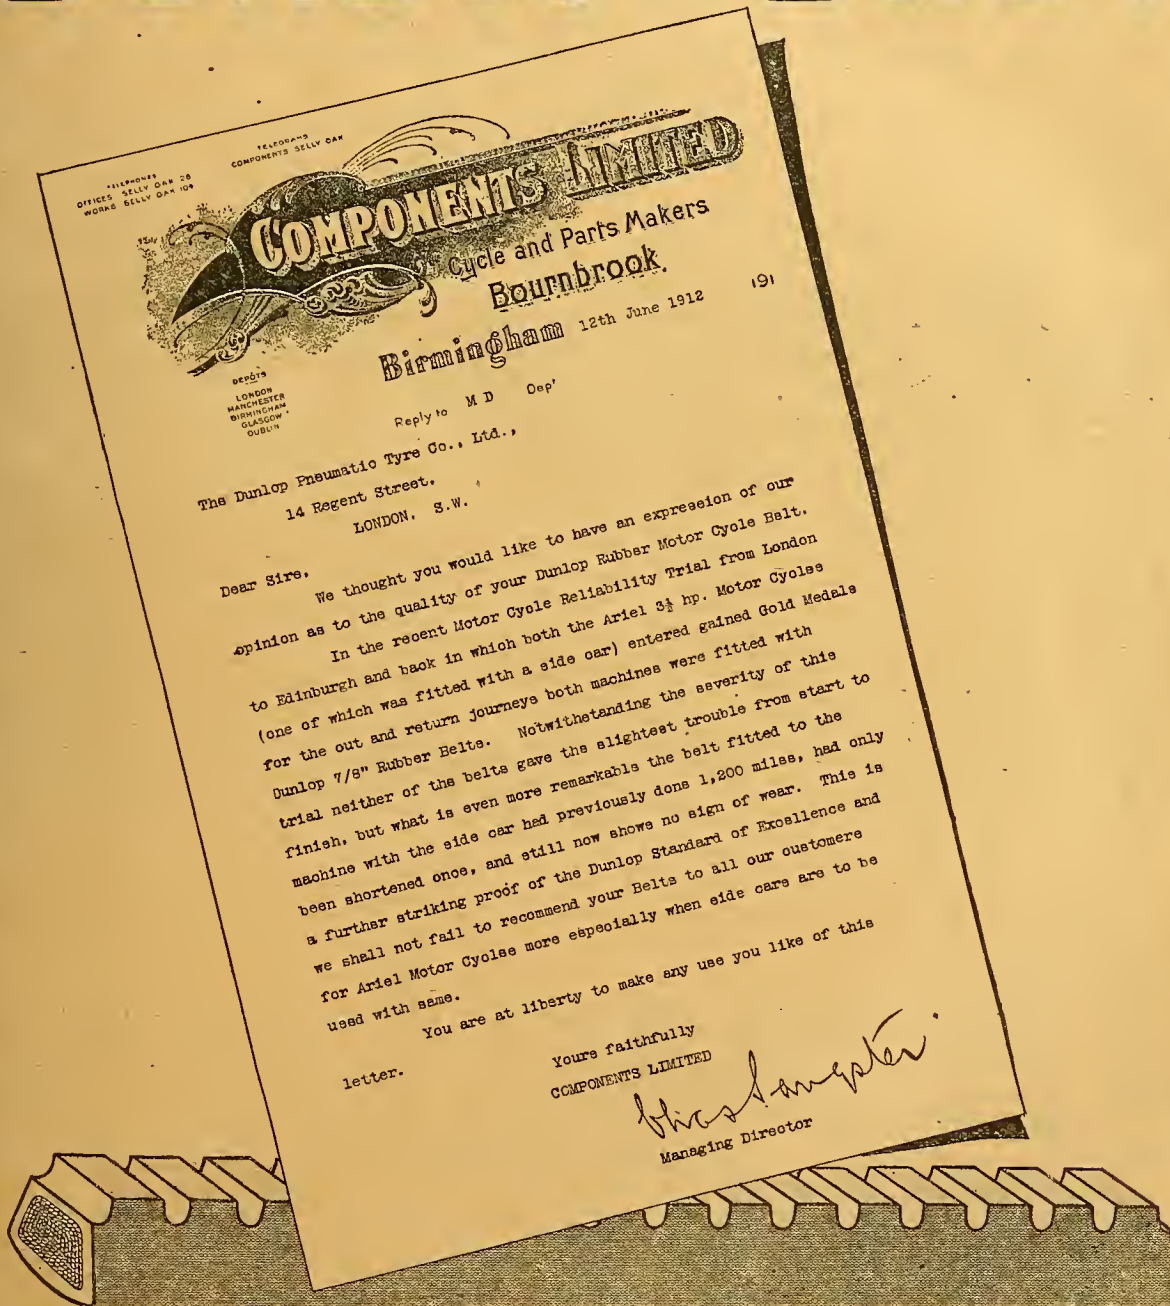

The order on the third lap was unchanged, with the exception that Newman had to give up his duel with Kickham, as he dropped back considerably owing to a burst tyre, and Ellis (N.U.T.) had overtaken and passed Petty (Singer), and Owen (Forward) had crept up a place. How slowly the time passed for those who with pent-up feelings watched for the survivors on the last lap of the thirty-seven and a half miles course can be better imagined than described. When again Kickham, Bashall, and Cox passed in the order named, it was seen that these three would count the winner among them.

Bashall started after Kickham, and had 6m. in hand. Three private owners fighting out a battle of their own is indeed a new feature of T.T. races, and each is deserving of the greatest credit. Their success was most popular.

## OBSERVATIONS AT CREG WILLEY AND CRONK-Y-BODDY.

**A**T 8 a.m. I made a start for my allotted position on the course (Creg Willey's hill), and on my way out, though no rain was falling, some very dangerous patches of grease had to be traversed, especially under the trees and round sheltered corners. I selected a point on the sharp right-hand bend to watch the corner work, and almost directly afterwards a heavy rainstorm came on, which continued till most of the competitors had passed on their first lap.

At a quarter past ten exactly, the roar of a perfectly-tuned twin was heard approaching, and immediately afterwards Bailey shot by on his Douglas. He took the corner fast and close in, and disappeared up the hill with a final roar. Next came Petty's Singer, which was naturally not quite so fast, as it was handicapped by its engine size. Both Petty and O'Donovan (also on a Singer) had serviceable looking belt guards, which must have proved particularly useful on the first lap. Then came Stewart and Kickham on Douglases, the latter going particularly well, followed in quick succession by Newman (Ivy-Precision), Cox (Forward), and Brown and Watson (Humbers).

Brown stopped before the crest of the hill to shorten his belt and tighten up a plug terminal. This, however, did not take him long, and he was off again in a few minutes. The next few machines passed at longish intervals. W. H. Bashall was particularly noticeable on account of his pace. Evans came along in the twelfth position, and when he passed his engine was missing fire, owing to plug trouble which dogged him all day. Mundy, who was riding the new four-speed Douglas, came up the hill on rather too high a gear, and the engine never attained its maximum revolutions.

**A Well-tuned Engine.**

Pratt (O.K.-Precision) was travelling well, and his machine had a clean healthy bark, denoting a well-tuned engine. By this time the sun was shining brightly, and with the help of a good stiff breeze the road surface was rapidly improving.

Moving to the fast stretch of road which lies between the top of the hill and Cronk-y-Boddy, I caught the sound of a racing single approaching. Could it be Petty's Singer, worked up to first place in the second lap? There was quite a flutter of excitement amongst the little crowd of spectators gathered at the cross roads, near the village, as a head and shoulders appeared over the crest of the hill. It turned out to be Stoeffel on his Alcyon, still on his first lap. He came down the straight very fast, but wobbled slightly. A few minutes after he had passed, Bailey flashed by again at a great speed, his spare belt dangling dangerously behind. However, he appeared to be quite conscious of the fact, for he looked round and continued on his course. After an interval of about ten minutes Kickham came by, also travelling very fast.

There was a strongish wind on this section of the course blowing at the riders' backs, which considerably improved their speed. Newman ran third in this lap, the speed of his single-cylinder machine astonishing everyone. W. H. Bashall came fourth, and he cheerily waved his hand as he rushed by and disappeared on the down slope. He had picked up five places, and was going particularly strongly.

Cox came next, the quietness of his exhaust giving one the entirely fictitious idea that he was travelling slowly. Then O'Donovan went by, his little Singer engine (one of the smallest in the race) turning over at a wonderful speed. Ellis (N.U.T.) had gained six places, and appeared to be travelling fast and quietly. Petty was still well up, but had dropped a place or two. Pratt was going well, and Evans passed with his engine still missing fire.

The competitors had now spread out a good deal, and it was not long before Kickham passed on his third lap, followed, after a short interval, by W. H. Bashall. These two, followed by Cox, had now taken up the positions in which they finished, Bashall winning on the difference of starting times. What had become of Bailey? Had his spare belt got in the back wheel and given him a nasty spill, we wondered? There was some anxiety shown, and we were quite relieved when we heard that he was safe and sound, though hung up with gear trouble on the mountain road.

**A Piece of Bad Luck.**

The race now became decidedly dull from a spectacular point of view as the riders passed singly and at long intervals. This decided me to make a move, and by following devious byways, chiefly noticeable for their entire lack of surface and awful grease, I eventually arrived at Ballacraire corner in time to see the seventh competitor pass on his third lap. This proved to be Owen (Forward), who took the corner carefully and got away in style on the up slope. O'Donovan followed, and then, after a longish interval, came Newman, riding very slowly and wobbling terribly, and it was soon evident that his back tyre was flat. He pulled up at the corner for repairs, and having hastily removed the rear wheel, he repaired the damage and made a fine effort to catch those who had passed him. This, however, he was unable to do, as a burst tube takes some time to repair. This was a piece of extraordinarily bad luck, as he was running third, and but for the accident would undoubtedly have been the first single-cylinder rider to finish. As it was, this honour fell to Harold Petty, whose little Singer performed extremely well.

**The Pick-up of a 2½ h.p. Twin.**

Haslam (Douglas) took the corner carefully, but shot away directly he had got round. It is a noticeable fact that in these days of variable gears and change speed devices corners can be taken with more caution and yet without the loss of valuable time, for the pick up of a modern 2½ h.p. machine on a low gear is nothing short of marvellous. Kickham held the lead at Ballacraire Corner on the last lap, followed by W. H. Bashall, both going as well as on the first circuit. Next came J. T. Bashall (Humber) still on his third lap, and, as usual, Pratt's yellow O.K.-Precision attracted our attention. Time was now getting on, and as I particularly wished to see some of the finish I rushed off again, and after more execrable side roads reached Douglas just after the first three machines had finished. I saw very little trouble, and fortunately no accidents. What incidents I did see were almost entirely confined to belts at Creg Willey on the first lap, and poor Newman's burst tyre.

H.D.T.

## THE RACE AS SEEN FROM THE RAMSEY DEPOT.

**T**HE Ramsey depot is not usually regarded as one of the most interesting points from which to view the T.T., but it was very promising at the start of the Junior Race this year. The main road from Sulby to Douglas runs through the centre of Ramsey in the form of a soundly macadamised loop, but the racing course takes a short-cut via a private road, which has never been properly metalled. This year the private road (some 300 yards in length) was in truly execrable condition, great pools of water three or four inches deep alternating with sludgy puddles and hard ridges. It is impossible to imagine a more diabolical bit of going for racing purposes.

About 9 a.m. the roadmen set to work to sweep the water off the road with heavy brushes, but towards 10 a.m. a great storm, which had been hovering over Snaefell, burst upon us, and the only possible plan was to telephone across to Douglas that the men might ride on the footpath. This

permission introduced a certain gymkhana element. The cinder path (4ft. 6in. wide) had to be mounted at an angle, where a formidable stone wall awaited the unlucky Jehu who miscalculated his swerve off the road; then it flattened out to cross a by-street, and where it began again was well guarded by pools and sludge. Then it ran for 200 yards along some iron railings, through which daring urchins constantly thrust their heads, and finally the riders had to charge down off the path again on to the road at the start of a sharp uphill curve.

As we stood patiently in the driving rain, waiting for the first arrivals, prophecy ran riot, and the general opinion was thus early in favour of a Douglas win, as their combined drive employs a large counter-shaft pulley, and so minimises belt slip. Consequently, we were not surprised when the first distant rattle proved to be Bailey, who roared past at a great speed with his spare belt trailing in the

### The International Motor Cycle Tourist Trophy Races.—

mud, having covered his first twenty-five miles in 35 mins. This was equal to a 52½ minute circuit, and was very creditable considering the perilous road conditions; some twenty miles out of the thirty-seven were bad enough to excuse an expert's side-slipping at touring speeds.

Kickham was the next man through, his nett time being half a minute better than Bailey's, and the Douglas backers were already shaking hands. As the procession roared through, W. Bashall and Rex Mundy (also on Douglas machines) were lying third and fourth, with Newman (Precision) and Creyton (Humber) fifth and sixth respectively. We could hear the shrill reverberating rattle of the exhausts dying away up into the mountain for a good three minutes after a machine had passed, and, judging by ear, W. Bashall, Newman, and Kickham were travelling best above the hairpin.

### Dodging the Bunkers.

Meantime there was plenty of sensation under our very noses. Harrison Watson pulled up with a dead taut belt of large section absolutely refusing to grip, and lost five minutes drying out. Cox preferred the road to the path, and got through in clouds of spray with a racing engine and much plunging in the sludge. Petty quitted the footpath too soon, and had to stop just as he struck the hill, for his belt was swamped and his plugs flooded. O'Donovan came through very slowly, and managed to dodge all the bunkers. J. T. Bashall pulled up sadly, and cleaned both his plugs. When engines are racing continuously for twenty-five miles (as most straight-through belt drives did on the first lap) it is difficult to lubricate with accuracy. W. H. Bashall made an electrifying transit, narrowly missing the wall as he mounted the footpath.

Creyton, like several others, shorted his plugs and got his belt slipping in the "water jumps"—at one time there were five or six men stalled with drowned machines, but they all got away by mopping the wet off the porcelains. Slatter was the only starter who never reached us, though Evans, Watson, Brown, Stewart, Haslam, and Stoeffel were all very late. The latter's clothing was all cut about.

On the second lap Bailey shot through faster than ever, and made a magnificent recovery from a hair-raising wobble

M. Stoeffel (2½ h.p. Alcyon) fell at his first attempt to round the corner at Quarter Bridge. He is seen straightening the handle-bars.

when he dropped off the footpath. As we afterwards learnt, he stripped his gears whilst changing up just above the hairpin. W. H. Bashall was now neck and neck with the Australian on nett time, and the latter's misfortune prematurely ended a most promising duel.

Bashall took the footpath more cautiously than on the first round, but the sun was now shining again, and, aided by a strong wind, the roads were drying fast. Newman and

Kickham were pressing the leaders hard, but this quartet had drawn well away from the field. Nobody got stuck in the sludge and water on this round; quite half the men kept in the centre of the road, but they took their bath at touring pace, instead of racing into it as before.

Two or three men replenished their tanks at the depot, and Pratt on the O.K.-Precision overhauled his compres-

S. L. Bailey (Douglas) taking the Gooseneck at speed.

sion thoroughly, renewing his valve cap washers, and adjusting his exhaust tappet. He had lost half his front brake clip, and as his rear brake shoe was glazed he was finding the corners anxious work.

Evans explained his requiring 2½ hours for the first sixty-two miles by saying he had stopped seventeen times, chiefly due to constant belt troubles and the wet state of the roads. Bailey, in spite of his speedy running (63 miles in 94m.), stopped three times in the first round and twice in his incomplete second. The Australian looked bitterly disappointed at his hard luck.

### A High Speed Reliability Trial.

On the third lap W. H. Bashall and Kickham were quite out by themselves, and as the conditions had improved, the remaining forty-nine miles resolved themselves into a high speed reliability trial between the two Douglas cracks, with Cox hanging doggedly on, ready to avail himself of any slackening. Nobody was within fifteen minutes of these three. J. T. Bashall wobbled in over the Sulby grease to retire with his back tyre punctured, but was more than consoled when he heard that his brother had a cosy lead. Ellis came in quite coolly, and managed to take a huge bite out of a wad of sandwiches, even in the act of restarting. The marshals were uneasy at seeing him take a dirty belt on board, which he claimed to have left behind on the first lap.

News now came in that "Duggie" Brown's pulley bearing had given out on the mountain, and that Newman's absence was due to a tyre burst (place unknown). Stewart again took the water jumps too fast, and sustained a stop on the awkward slope, where restarting was exhausting. Pratt's engine was once again compressionless and blowing through at its joints, but he was uncommonly smart at replacing the washers, and his yellow machine barked away again in good form.

We now settled ourselves to watch the final of the Bashall-Kickham duel, and the excitement was intense when they rounded the wide sweep into the town almost simultaneously. Bashall pulled up, waving frantically, while Kickham shot through along the footpath, crouching so low that he almost disappeared into his tank fillers. Bashall only wanted a can of oil emptied into his tank, and shot away again after a lightning stop with practically the whole of his starting allowance (six minutes) in hand of Kickham. This was nearly enough to ensure a win if he had to coast down from

### the International Motor Cycle Tourist Trophy Races.—

Snaefell Summit, and when the telephone announced that the pair had passed the Bungalow within two minutes of each other, we knew that a double-barrel Douglas win only depended on the correctness of their engine dimensions.

Cox was nearly fifteen minutes behind, and the disqualification of the leaders was, therefore, his only hope. This comparatively little known man is a really fine rider. The

others were miserably tailed out, and, as usual, the concluding stages excited very little interest.

A visit to Sully Bridge proved that for once this ill-omened corner occasioned no excitement, except for Mundy's belt coming off when another rider was on his heels; while the solitary thrill enjoyed by the crowd at the hairpin was Bailey's mournful *coup de grâce*, received when he looked like a winner. B.H.D.

### CONCERNING THE WINNER AND HIS MACHINE.

It was our pleasant duty to congratulate an old friend upon winning the Junior T.T. W. H. Bashall, of Ockham, Surrey, is an amateur motor cyclist and car driver, and has had a most varied experience of all forms of motor vehicles. This was his fifth appearance in F.T. races, a previous success being second position in the 1908 race, when he rode a 5-6 Bat-Jap. Bashall is a rider of fine physique and scales 13 stones, so that the manner in which his little Douglas sped over the ground is all the more remarkable.

We were astonished to learn that he stopped six times in the first lap, due to mud being thrown on to the back plug by the belt. Despite this handicap, he was second on time. He stopped again in the second lap to fill up with petrol and oil at the Woodlands depot, Douglas, his only other stop being for oil at Ramsey on the last lap. His chances of the trophy were almost jeopardised by this shortage of lubricating oil, which caused him to resort to the low gear for five miles. The gear ratios, by the way, were  $4\frac{1}{2}$  and  $7\frac{1}{2}$  to 1. He was not aware of his position until at Ramsey on the last lap, where Alec Ross told him that Kickham was leading him by a minute. After that, Bashall told us, he rode as he had never ridden before in any T.T., which will be best understood by those who know his dash and daring. He further confided to us that the 350 c.c. Douglas was as fast as his last year's 585 c.c. Senior twin.

Harry Bashall, the winner, being carried shoulder high by W. W. Douglas and A. J. Sproston.

It is an interesting fact that, although he dashed through the mud and grease, he experienced no sign of belt slip whatever—a testimony to the big driving pulley.

Bashall related one or two amusing incidents of the race. He started with his breeches pocket full of tools, but these

chafed on the tank, wore a hole through the cloth, and one by one dropped out on the road. Once when he stopped to clean a plug the rag he was using burst into flames. Another incident of his eventful ride was when dropping down the mountain road at a mile a minute speed.

He was gradually overhauling P. J. Evans on the Humber, who was responding to the appeal of the Frenchman, Stoeffel, for an inner tube, and just as Evans threw it overboard, Bashall, dashing along in the rear, caught it on his toe and carried it along some distance. As regards the running of his horizontal twin, it behaved faultlessly throughout, and if anything was faster at the finish than at the start. It is safe to say that there has never been a more popular winner of any Tourist Trophy. The enthusiasm was tremendous, and Bashall was lifted shoulder high as soon as he dismounted his faithful Douglas. In the evening

the scenes of enthusiasm at the Palace, Douglas, when the trophy was presented by the Clerk of the Rolls will be remembered for a long time to come. The winner's Douglas had an Amac carburetter, Hutchinson tyres, Bosch magnet, Lyso belt; whilst Pratt's spirit and Price's oil were also used.

### THE GYMKHANA.

On Saturday afternoon a gymkhana was held on Belle Vue Racecourse in aid of the Isle of Man hospitals. There was plenty of fun, and everybody enjoyed himself to the full. The first event was a to-and-fro race. 1st, Verron Taylor (Rudge). In the hfebelt event, Vernon Taylor was again first in the foot race, but only finished second in the belt fixing. In the cigarette-lighting race the competitors had to race over an allotted distance to ladies, who provided cigarettes and matches, and had to light the former. In this Taylor was first, Fenn second, and Woodhouse third.

The next item on the programme was a potato planting race, in which ladies in sidecars had to put potatoes in flower pots. J. Jones (Bradbury sc.) was first, Eric Myers (Scott sc.) second, and Hugh Gibson (Bradbury sc.) third. Myers was riding a new Scott sidecar, beautifully sprung and extraordinarily comfortable. The writer had a ride in it round the track, and found it the most comfortable in which he had ever sat.

Next came a duel on the track, W. G. McMinnies (Triumph) versus W. Douglas (Douglas), in which the Triumph proved an easy victor. The track was of grass and very soft and rutty in one corner.

During the afternoon the Douglas riders, who turned up in red caps and red sashes, were persuaded to run a one-design race. Early in this Stewart had a bad toss and

rolled over and over, but with better success than A. H. Priestley, who before the gymkhana started had a nasty spill, and dislocated his shoulder. W. H. Bashall held the first place all through, and finished first with Bailey second, but both had a tumble after passing the finishing line. Quite an amusing event was the three-mile motor-paced cycle race, Alec Ross (champion of Scotland 1880) v. George King (six hours' record holder 1887). Ross was conspicuous for what he did not wear and King for what he did. Ross came in an easy winner. The gymkhana closed with a tug-of-war, single-cylinder riders *versus* twins, in which the twins were victorious. Twenty pounds, it was said, were cleared for the hospitals.

A most regrettable accident occurred during the practising on the Thursday. John Gibson, a sportsman of the best type, had travelled down Bray Hill at a good speed on his Trump-Jap, when a car driver unexpectedly backed out of a side road across his path. Poor Gibson did his best to avoid the car, but unfortunately hit the front wing. He was taken to hospital where it was found he had a fractured skull and other minor injuries. He has been steadily improving, we are glad to say, and his condition on Tuesday gave hopes for recovery.

# THE SENIOR RACE.

## HIGH SPEEDS. FINE RIDING.

THE morning of the great race was none too promising as regards weather. A cold north-westerly wind was blowing, it had rained in the early morning, and mist hung heavy on the mountains. Fortunately, however, greasy patches were comparatively few in number, and the strong wind was in favour of the com-

Lining up for the start. No. 1, J. R. Haswell (Triumph); No. 2, J. R. Alexander (Indian) and W. Heaton (Dot-Jap). In the foreground is Mr. J. R. Nisbet, clerk of the course; at the extreme left Mr. T. W. Loughborough, and next to him the timekeepers, Messrs. F. T. Bidlake and A. V. Ebbelwhite.

petitors up from Ramsey and down from the Bungalow. The preliminaries were much the same as on Friday last, the only difference being an increased number of spectators and the better preservation of order on the course. The competitors were roped off from the crowd, and marshals with two ropes—one each side of the road—kept people from encroaching on the men at the start.

Haswell (Triumph) was given the word "go" punctually at 10 a.m. J. R. Alexander (Indian) got away well, and so did Heaton (Dot), who was the oldest rider in the race. N. F. Holder's (Blumfield) engine fired immediately and had a clean, healthy bark. Hart-Davies (Triumph) had a gummy and refractory engine, which required a long, strong push to make it fire. Applebee (Scott), with his father looking proudly on, essayed a start on low gear from a standstill, but in his haste he stopped the engine; it restarted at the second kick. Philipp (Scott) was more successful, and got away in excellent form. Garrett (Regal-Green) was the funny man among the competitors. He, as also did Woodhouse, wore an elaborate blue garter on the left knee. When Franklin (Indian) got away just before him, accelerating splendidly, with his engine emitting a healthy roar, Garrett facetiously complained of the noise, and later, when he had a stop during the race, he shook hands with a spectator and wished him good-bye.

Bolton's Rudge was in absolutely new condition and looked wonderfully smart. Griffith, on Watson's Humber, looked too lightly clad for a long race on a cool morning, wearing a leather waistcoat, flannel trousers, and no gloves.

Petty next came up with his Singer with its musical release valve, at which someone remarked, "Hence the machine evidently derives its name." Ware (Zenith) started on one cylinder, but the other quickly chimed in. By this time news came to hand that Haswell, J. R. Alexander, Applebee, Philipp, Blumfield, Heaton, Garrett, and Franklin were at intervals passing Ramsey. Next Bailey, calmly smoking a cigarette, came up to the start. The brothers Collier went off amid the hearty cheers of the crowd. Then came Mundy (Singer), and last of all started Jamieson (Singer) and Kickham (Douglas).

## ANOTHER BRITISH SUCCESS.

Just after the latter had left, Haswell was announced to have passed the Bungalow, up to which point no one had overtaken him. Soon after he arrived, travelling splendidly, followed by the redoubtable Applebee, whose stand was trailing. All appeared to be going well, and among them Bailey's gallant little Douglas was conspicuous.

### Order of First Lap.

The order of the first six past the post on time was:

Rider and machine.	m. s.	Speed
		m. p. h.
1. F. A. Applebee (Scott) ...	46 31	= 48.37
2. F. Philipp (Scott) ...	45 54	= 47.87
3. J. R. Haswell (Triumph) ...	48 20	= 46.55
4. H. Mason (Matchless) ...	48 32	
5. S. F. Garrett (Regal-Green) ...	48 56	
6. H. A. Collier (Matchless) ...	49 0	

In the first lap procession Griffith passed with a broken footrest. News came to hand that Mason, who was fourth in the first lap, had had a fire at Ramsey, but had gone on. However, he was never seen again at Woodlands. A. S. Jones (Rudge) was reported to have left his machine at Hilberry and to be walking towards the finish. It was long before he arrived, and when he did turn up he told dire tales of a broken valve which had jammed in the cylinder and a broken plug.

### A Disqualification.

Mundy stopped near the timing box through lubrication troubles. The oil refused to flow into the crank case. Hart-Davies was reported to have retired at Ramsey owing to a seized engine, but, to the great astonishment of everyone, he turned up on the next lap and succeeded in finishing. He was disqualified, however, after the race as he took in petrol outside a depot. Bailey was announced to have had a broken chain near Ramsey, to have repaired it, and to have continued.

### The Second Lap Order.

Rider and machine.	h. m. s.	Lap speed
		m. p. h.
1. F. A. Applebee (Scott) ...	1 32 33	= 48.88
2. F. Philipp (Scott) ...	1 35 37	= 46.39
3. J. R. Haswell (Triumph) ...	1 36 26	= 46.87
4. C. B. Franklin (Indian) ...	1 37 11	
5. H. A. Collier (Matchless) ...	1 38 21	
6. H. Reed (Dot) ...	1 38 57	

J. L. Emerson (Norton) and J. B. Hart-Davies (Triumph) on the footpath at Ramsey, in order to avoid a bad stretch of road.

J. W. Blumfield (4 h.p. Blumfield) leaving Ramsey.

The two Scotts seemed to have established themselves as first and second, Mason had retired, and Garrett had lost his place. Franklin had got up to the fourth position, while H. A. Collier and Reed began to creep up towards the top of the list. Just about this point in the race, P. W. Owen (Norton), who had not been seen for the first lap, at last appeared, having taken 2h. 25m. 28s. to make one circuit. In the third lap, Applebee, whose stand was in position on the second lap, was again trailing this part of his machine on the ground.

Haswell rode close behind him. Hart-Davies appeared to be going well on this lap.

**Third Lap.**

Rider and machine.	h. m. s.	Lap speed. m.p.h.
1. F. A. Applebee (Scott) ...	2 18 4	49.44*
2. F. Philipp (Scott) ...	2 22 3	48.47
3. J. R. Haswell (Triumph) ...	2 22 52	48.47
4. H. A. Collier (Matchless) ...	2 26 33	
5. C. R. Collier (Matchless) ...	2 29 31	
6. C. R. Martin (Triumph) ...	2 30 38	

\*Fastest lap of the day.

The first three, it will be noticed, kept their places. Franklin dropped out owing to a buckled wheel caused by a fall on Bray Hill, and gave the fourth place to H. A. Collier, who was greeted with applause when he next passed the timing box. C. R. Collier also crept up into fifth place, with Martin (Triumph) sixth.

**Fourth Lap.**

Rider and machine.	h. m. s.	Lap speed. m.p.h.
1. F. A. Applebee (Scott) ...	3 4 40	48.97
2. F. Philipp (Scott) ...	3 8 55	48.01
3. J. R. Haswell (Triumph) ...	3 10 59	46.76
4. H. A. Collier (Matchless) ...	3 14 48	
5. C. R. Collier (Matchless) ...	3 19 15	
6. D. C. Bolton (Rudge) ...	3 20 38	

It will be seen that the order of the first five remains unaltered, but carburetter and other troubles put Martin back and gave the sixth place to D. C. Bolton, who had earned it by his consistent running. Bolton, however, retired later with a broken valve. Griffith (Humber) managed to complete four laps satisfactorily, and then ran out of petrol on the mountain and had to retire. The final results will be seen in the lap table on next page.

W. Heaton (3½ h.p. Dot-Jap) and I. B. Hart-Davies (3½ h.p. Triumph) at the hairpin on Snaefell.

## The International Motor Cycle Tourist Trophy Races.—

## A Well-deserved Victory.

Applebee carried off the trophy after a hard fight and well-deserved victory. Haswell showed by being beaten only by 5m. 54s. that the day of the single-cylinder is not yet over. Had not Philipp's tyre come off the rim at

Ballaugh Scotts would have finished first and second, but Philipp with an oval rim dropped from second to eleventh place. Applebee's win was most popular, and on his arrival he was lifted shoulder high, a position which he rapidly and modestly changed for *terra firma*. Hoffmann and Adamson placed two more Triumphs among the first six.

## SENIOR T.T. LAP TIMES AND RESULTS AT A GLANCE.

## THE RACE FROM DIFFERENT POINTS.

THE ideal way of seeing a T.T. Race is to vary one's position. Perhaps a balloon or aeroplane would provide the best means, but, in the absence of these, I resolved upon a plan to see the Senior Race from different points. Assembling with the competitors at Woodlands gave me an opportunity of finally examining each rider's machine, and I was particularly disappointed to learn that Harry Bashall had decided not to ride. He was over persuaded, and regretted it before the race was over. Monday broke dull, and there was a boisterous wind accompanied with fine rain at 7 o'clock, and at 9 clouds obscured the summits of the hills, so that the outlook at the commencement of the proceedings was not of the best.

The crowds assembling on the course were noticeably larger than on Friday. Haswell told me that the grease on the mountain was very treacherous (he had been staying at Ramsey as usual). How workmanlike and clean the brothers Collier keep their Matchless machines! The Indians were all ready for the fray, every detail having received attention, the petrol pipes being wrapped up with insulation tape to prevent leakage in case of a fractured pipe. W. H. Wells had told me to watch A. H. Alexander who had shown great promise

in practice. The Scotts which, on arrival, were immediately surrounded by a big crowd, had two sparking plugs to each cylinder. Plugs have caused this make considerable trouble in the past. Applebee and Philipp started favourites. C. R. Martin was reported to have the fastest Triumph.

## Excitement at the Start.

The manner of starting was interesting to watch. Some undoubtedly got flurried and did things which they would never do in the ordinary course.

J. R. Alexander went off at a big rate on his Indian, a strong wind assisting the competitors.

Hoffmann made the best start of the Triumph riders. The Regal-Green riders were joking everlastingly, and seemed not to be too seriously concerned in the race. Ware started with one cylinder firing, but soon made up lost time at the start by means of the Gradua gear. C. R. Collier was another who made a poor start, and Mundy had to stop and flood the carburettor before finally getting away.

Hardly had the last and fortieth man started—Kickham (Douglas)—than the telephone announced that Haswell had passed the Bungalow first, so it was clear he could hold his

Percy Butler (Triumph) leaping over Ballig Bridge.

own with most of the twins following him. J. R. Alexander (Indian), Applebee (Scott, seventh to start) were the second and third riders announced, and Martin (Triumph, No. 17) next. This order was maintained past Hilberry and Willaston corners, and also past the starting line.

It is strange, after past experience, that such a common trouble as trailing stands should befall T.T. competitors at this stage, but a number were troubled in this wise. J. R. Alexander's stand bumped on to the ground every twenty yards as he flashed past the scoring board, with F. A. Applebee on his heels.

After rounding Quarter Bridge the Scott was much quicker in picking up than the Indian, and so Applebee had overhauled four competitors in little more than one lap. Next Hart-Davies's burly form loomed in the distance, his leather waistcoat inflated like a balloon by the wind. Already the race had proved far more interesting than the Junior event, the waits being much shorter and less frequent. As on Friday, the riders exercised great caution at the corners, but I was impressed by the fact that the Triumph riders approached the bends much faster than the majority, relying absolutely on the efficiency of their brakes in the last fifty yards to steady their breakneck speed.

#### Private Races.

The times were faster, in my opinion, by reason of the duels being fought out on the course. I noticed Adamson

doing a steady 50-55 m.p.h. along a favourable stretch, and an Indian twin overhauling him, and immediately Adamson realised this he found some more speed somewhere, and these two riders disappeared side by side. Up to the fifteenth competitor the only three missing were the Blumfield riders, but they appeared later, and it was a noticeable feature of the race that of the forty starters all completed the first lap.

Kirk (Triumph) was going in fine style, having passed a number, but we hardly agree with him waving to friends at mile a minute speeds. Petty's Singer was more of a touring machine than any; it was moderately quiet, too. Huckle, who had had innumerable falls in practice on his Zenith, was going steadily and well. Griffith, on a 2½ h.p. twin Humber, was travelling wonderfully fast, but I noticed his right foot rest bent. Harry Collier had passed his brother, but he only led by half a minute or so. These veterans received a cheer each time they passed, for the Colliers are wonderfully popular on the Island. I have a firm conviction that the Colliers little thought that they were to be beaten, for a number who saw them at different points of the course confirmed my belief that they did not seem to be exerting themselves. I was not aware at the time that C. R. was having trouble with his ball bearing pulley.

Bailey (Douglas) passed, having completed a fast lap, despite a fall on the Ramsey hairpin. Harry Reed (Dot) had kept his place, but Perryman (Blumfield) was very late. The scene at the Kirk Braddan depot was interesting.

Frank Philipp (Scott) running on to the pathway at Ramsey.

I watched several replenish, and Garrett (Regal) adjust his float needle. News reached here that Mason's Matchless had momentarily caught fire while being filled with petrol, and the wonder is that more were not ablaze considering the way the spirit was bundled into the tanks and slashed over the hot engines.

#### At Willaston.

I then moved to Willaston Corner, and Haswell passed, having still retained his premier position, his machine being bumped about badly on the uneven surfaces. Sirett (Indian) was close behind endeavouring to kick his stand up. Applebee was gaining on the No. 1 man, and had time to wave and smile. Evidently his position had been signalled to him.

Alexander (Indian) followed Philipp (Scott) going faster than ever. There were longer gaps now as the ranks were gradually being thinned. A noticeable feature of the race was the fine running of the eight Triumphs. Almost regularly as clockwork they came round each lap until the fourth when Quentin Smith, the Manxman, was delayed by a burst tyre.

The little Douglasses sounded much like the Scotts in the distance and they were going splendidly.

As the power of the sun increased it made matters much more pleasant, but the wind did not appreciably lessen in its strength. There was a short period of suspense at Bray Hill as the inevitable dog ran into the road as a racing machine was heard approaching. It was chased by excited officials, and eventually left the course.

J. Woodhouse (Regal-Precision) and E. B. Ware (3½ h.p. Zenith) travelling towards the Gosceneck on the mountain road.

## The International Motor Cycle Tourist Trophy Races.—

The winner, F. A. Applebee (Scott), filling up at Ramsey. With the assistance of O. C. Godfrey (last year's winner), he replenished in the record time of 14 secs

## CREG WILLEY AND CRONK-Y-BODDY.

THE sound of the first competitor reached me on the bend of Creg-Willey, ten miles from the start, at 10.13 a.m. As the noise increased, Haswell (Triumph) appeared, and taking the corner fast, but a shade too close in, vanished up the hill at a fine pace. He was followed by J. R. Alexander (Indian), who seemed to change a little late; his machine, however, picked up rapidly on the low gear. Holder's Blumfield shot up next, the sharp crackle of his water-cooled engine being particularly noticeable. Hart-Davies's Triumph did not seem worried with its 13 stones odd rider, and took the rise in style. Applebee's Scott ran fifth, both he and Philipp (Scott) creating a very favourable impression by their speed, silence, and fine cornering.

Perryman's Blumfield passed, going well, but got hung up within a mile by a burst tyre, which caused a stop of nearly half an hour. Franklin's Indian came up well. Garrett (Regal-Green) came very fast, but took the corner too wide and nearly hit the bank. After an alarming wobble he made a fine recovery, but as he disappeared his engine was misfiring slightly. Quentin Smith (Triumph) changed into the high gear too soon and had to change down again. P. W. Owen on a long stroke Norton tore by, but his engine began to misfire badly, and he stopped to change a plug. Hall's Rudge was travelling slowly, something which we could not discover being obviously amiss. Bailey's Douglas roared by, and seemed to be going much faster than several of the larger machines.

The Collier brothers were going well up to their usual fine form, C. R. just leading, and Harry Reed (Dot) went by like a flash. The competitors passed wonderfully close to their starting order.

## Applebee Gaining.

At the conclusion of the first lap I moved up the hill to the long undulating straight. There was a very short interval before Haswell passed on his second round, followed by Applebee, who had run up into second place. J. R. Alexander came next, and then Philipp. David Bolton went by at a great speed, having picked up five places; his Rudge appeared to be in fine fettle. C. B. Franklin had worked up four places and seemed very fast. A. H. Alexander brought his Indian along fast, but had dropped several places, and Harold Petty (Singer) had passed five men. Ware and Huckle on Zeniths went by, one behind the other. Woodhouse (Regal-Precision) was exceptionally fast, as also was W. Jones (Rudge).

The Collier's passed together again, but H. A. had taken the lead, and I afterwards learnt, maintained it all through

Emerson (Norton) wobbled badly as he hit a lump in the road while descending Bray Hill. The two Nortons were extremely fast, and the two riders of this make must have had trouble or they would have been in the running. Petty (Singer) shed one of his number plates, but he was going so fast it is doubtful if he knew it.

## A Record Breaker Checked.

C. B. Franklin (Indian) fell heavily at the Bray Hill corner, but he jumped up, and without stopping to examine his machine shot off again, his front wheel wobbling dangerously. D. C. Bolton was travelling best of the Rudge trio. Again I noticed H. A. Collier only half bent over his mount and looking about unconcernedly.

There were not many spectators at Willaston. Here I found Geo. E. Roberts telephoning news to the start. I also learned that Hugh Mason had fallen at Hilberry corner and damaged his knees, and had been taken to Douglas by a lady motor cyclist on a Scott sidecar. A police whistle denoted the approach of a competitor at this corner. Harry Reed was most cautious here, partly as he had already fallen and cut his hands. Haswell, Applebee, and Philipp were still leading, but nearing the completion of the fourth lap Applebee had passed Haswell, though the single-cylinder rider hung on tenaciously. He was much slower at Willaston corner, however. The interest here was very ordinary, so I wended my way back to Bray Hill and the finish, in time to see Applebee flash over the line as the winner, closely followed by Haswell. But Philipp was an absentee, and no news of him was obtainable on the telephone. Eventually it was learned that he had burst a tyre, which let in Harry Collier to third place. G.S.

the race. Bailey and Reed were both noticeably fast. There was a stiff head wind blowing down this section of the course, which had a considerable effect on many of the high-g geared machines, and thus the infinitely variably-g geared mounts scored, as they were able to reduce their gears till their engines were running at the most efficient speed.

In the third lap I moved just through the village of Cronk-y-Boddy, so as to get a view of the long downhill slope. Though the riders reached a great speed here, they were impeded by the curves, which, though not acute, cannot be taken all out.

Haswell still passed first, but the gap between him and Applebee was perceptibly shorter. Philipp had run into third place in order of passing, thus changing places with

J. R. Haswell (Triumph) filling up at Ramsey. He finished second, and was the first amateur and the first single-cylinder rider, average speed 47.27 m.p.h

F. A. Applebee (two-stroke Scott) finishing a winner of the 1912 Tourist Trophy Race. Average speed, 48.69 m.p.h.

J. R. Alexander (Indian). Hoffmann (Triumph) was working his way up, and rode extremely well; in fact, the regular running of the Triumph machines attracted much attention. The Blumfield machines had suffered a series of mishaps which put them out of the running. They had, unfortunately, had little time for tuning up, though when they passed me their speed was extraordinary. The Colliers were together as usual, H. A. having overtaken twenty-seven competitors since the start. Reed was going strongly, and when he went by seemed to be the fastest.

In the last lap Applebee took the lead, though he was hard pressed by Haswell, whose Triumph was none the worse for its gruelling. Philipp went by third, and I had no time to see more, but rushed off to the finish. On examination, the engine sizes proved well within the limit.

The Indian team were unlucky in losing their crack man Franklin, who, when well in the running, was put out by a buckled front wheel the result of a spill. The Colliers, who probably had most supporters in the Island, finished third and fourth, and the Triumph had scored an extraordinary team performance, being second, fifth, sixth, seventh, ninth, sixteenth, and nineteenth.

This is the first time that a two-stroke engine has won the classic event, and it remains to be seen what effect the win will have on popularising the principle. Finally, the capabilities of the modern Junior machine were demonstrated by Bailey and Kickham, whose Douglas machines finished fifteenth and seventeenth respectively. H.D.T.

### AT THE RAMSEY DEPOT.

IT was early evident that the Senior riders were not to be troubled with belt slip. True, Snacell was wearing its mist cap, but the old salts in the harbour asserted that with a nor'-west wind rain was improbable, and they were true prophets. On Sunday night, I walked down with the Triumph team to inspect the atrocious 400 yards of private road, christened the "water jump" by the Junior riders. We found the week-end's wind had evaporated most of the water, but the deep troughs remaining were too formidable to be risked. The first trough would set up a bad front wobble, and before it could be corrected, the machine would encounter the succeeding troughs, each of them a long pot-hole 5ft. or 6ft. across, and from 2in. to 6in. in depth. So we turned our attention to the footpath, and kicked down the ruts on it with our heavy boots, for Manx mud dries hard like cement. To show the pains some riders take, men like Haswell and Hart-Davies mapped out their track within a few inches all along this 400 yards of path.

On Monday morning it seemed strange to see men like Godfrey and Hugh Gibson lounging in the depot with attendants' badges on their arms; Godfrey in particular scented the air, gauged the wind, and eyed the track like some old racehorse turned out to grass. He was dogmatically confident that his business partner, Frank Applebee, would win outright, and events justified his certainty.

Ramsey depot is twenty-five and a half miles from the start, and as there is no real climbing along this section the best men came very near averaging 60 m.p.h. over it. At 10.23, J. R. Haswell (No. 1) was heard cutting out, with marvellous spitting and crackling, for the Ramsey corner, and he tore past at a truly frightful pace, taking the footpath past the bumps, and following to a hair's

E. Kickham (Douglas) at Balg Bridge. It will be noticed that both his wheels are off the ground.

## The International Motor Cycle Tourist Trophy Races.—

D. C. Bolton (3½ h.p. Rudge-Multi) rounding the Gooseneck.

breadth the line he had sketched out on Sunday night. J. R. Alexander presently followed, having thus early surrendered some two and a half minutes to the Triumph expert; we wondered already whether the Indian engine had been materially slowed by shortening its stroke. Let me here say that the Junior Race was child's play compared to the Senior. Some wiseacres opined that Bailey and Kickham on their Douglas machines would outstrip half the Senior entry, but on the first lap the fastest Seniors cut out such a pace that they ran perilously near the kerb entering the depot, and they passed by much faster than Bashall did on Friday.

By our rough timing thirty-two riders covered the first twenty-five and a half miles within a range of from twenty-seven to thirty-three minutes, Frank Philipp being the fastest. The Blumfields seemed to be touring. One or two men, notably Hugh Mason, Bolton, Martin, and Alister Kirk, rashly eschewed the footpath, and, rushing the bumpy road at speed, did involuntary "long-arm balance" on their handle-bars, simultaneously correcting frightful front wheel wobbles. A number of spectators wisely skeddaddled behind an iron fence. When all the men were through on their first lap (except Muddy, whose tyres delayed him), we made comparative notes, and found that the Scotts and Triumphs were fractionally faster than the Indians, while the two Colliers were already headed by several riders, and somehow or other Harry had managed to pass Charlie. Of the outsiders, the two Regal-Greens were travelling with most promise. No. 22 (Griffith) was a trifle late, and paused to pick up an inner tube. No. 23 (A. H. Alexander, riding Godfrey's victorious machine) came through misfiring, but went straight on up to the mountain, trusting to an automatic remedy. The two Douglas machines emitted such a continuous "hum" that many people mistook their approaching exhaust for the Scotts. When the crowd was past, the patriots rejoiced in the backward running of the red Indians, and voted for a Triumph win if the Scotts failed to last, while Godfrey vowed that Applebee's Scott at any rate was sure of a mechanical non-stop.

**Mist on the Mountain.**

We knew the second lap would be interesting, because the Triumph, Scott, and Matchless teams were due to take up petrol at 1½ and 3½ laps. The starting order was now becoming disarranged, and the men arrived in this order: Haswell, Applebee, J. Alexander, Philipp, Mason, etc., etc. Those who stopped told us the mist on the mountain was very trying, and that speeds over 20 m.p.h. were as perilous as they were inevitable. Suddenly cries were heard at the filling station, and a pillar of flame shot up from Mason's Matchless. Instead of mounting and "riding the flames out," as I saw Creyton do two years ago, he flung the machine down in the road. The sand was on the far side of

the depot, and there were no spades or buckets, but an army of marshals dashed sand upon the Matchless with their hands, and off it went little the worse. Meantime the furious procession kept roaring through, and by our timing the two Scotts were leading, Haswell lying third, with Franklin and the Colliers close up. Quite a crowd of machines, including most of the Triumphs, two Indians, Garrett's Regal, Bolton's Rudge, and Bailey's Douglas, were within five minutes of Applebee. Hoffmann, as he passed, caused great gloom by crying that Haswell had seized his engine on Creg Willey; but we guessed he must mean Hart-Davies. Blumfield had to reinflate his back tyre. Garrett and Bolton once more took the bumps all out, their bodies being jerked several inches up in the air. Quentin Smith's rear brake was missing—quite the most awkward *contretemps* imaginable in such an event.

**Jockeying for Positions.**

Great excitement was caused by six riders all arriving in a clump, and the jockeying that ensued to gain the footpath and the vantage round the bend into the mountain road was worth seeing. News of incidents began to filter in—a visit to the Hairpin showed that all the men were being sensibly cautious. Only Bailey sustained a fall there, and presumably until his first replenishment stop, he imagined that victory was possible for a 2½ h.p. by taking all risks.

Hart-Davies toured in looking very disappointed. He reported that his engine had seized six times in sixty miles, and finally his petrol union came loose, and his tank running dry, he had to replenish at an unauthorised point. He was about to retire when we pressed him to finish at all costs, even though he were afterwards disqualified, and off he went again. Petty walked in festooned with rent tubes; his back rim had been so kinked by a large stone that the cover refused to remain in position. Tyre troubles were unduly numerous, and a rumour went round that some malicious person had strewn the road near Sulby with nails. What principally surprised me in the depot work was the fact that some half-dozen of the epicyclic hubs required a most trivial adjustment, and that not one of the riders knew how to perform it. They fumbled and abused the hub until Hugh Gibson or some other bystander explained how the work should be done. Such reckless ignorance in a race is simply astounding!

The third lap lacked incident, except when Applebee and Jamieson entered Ramsey alongside, and the Scott deftly snatched the inside berth in time to dodge the bumps. Bolton again very foolishly preferred the road to the path and lost a lot of time. On the first lap eight of the forty starters took the road, thereby losing many seconds, but by the fifth lap everybody had learnt sense. It was already clear that only an accident could let up an Indian or a Matchless into first place.

The fourth lap was crammed with incident. The judges 'phoned through that we were to stop Franklin at all costs,

J. L. Emerson (Norton) on the twisty ascent of Snaefell mountain. The gradient hereabouts is 1 in 9.

## The International Motor Cycle Tourist Trophy Races.—

Rear brake mechanism of the T.T. Scotts, which, as will be noticed, acts on the tyre rim.

as his front wheel was dangerously loose, and a marshal stripped a child of a Red Riding Hood coat and waited at the corner for a long time, but Franklin never came round again.

## Nearing the End.

The Triumph men drank hot Bovril when they stopped. Martin hurled a broken belt at us and nearly lassoed a marshal. Hall reported an hour's stop with his tyres. Jamieson passed with his stand trailing. Petty after a stay of an hour went off with a fearful squeak in his engine. P. W. Owen reported using up nine sparking plugs. Hart Davies had seized his engine on two further occasions. Mundy walked in with his back tyre right off the rim. And so on. There was plenty of trouble about.

Our information as to the faster men's positions was as complete as could be had at Douglas, thanks partly to the telephone and partly to the accurate timing and lap-scoring of several officials. As we waited for the men's fifth and last appearance a motor cyclist brought in word that Applebee had passed Haswell just above the Gooseneck. This can hardly have been true, for presently they crashed through at a tremendous pace, Applebee leading and taking all risks, with Haswell fifty yards behind doggedly hanging on. Nobody else was quite so speedy as these two, and since Applebee had six minutes' starting allowance in

Petrol filter under float chamber, and rubber covered pipe on J. R. Haswell's Triumph.

The Douglas piston. The absence of the second ring will be noticed.

hand, we knew he had only to reach the mountain top to win. The telephone messages soon came in "7 and 1 passing Bungalow." "7 and 1 reached Douglas," and chief honours were secured for two immensely popular men. "What price Godfrey and Applebee shares now?" was the slogan. From observations made, we know Applebee could not have been ignorant how he stood, yet he was not sitting on his lead and riding quietly to finish, but fighting as though somebody were a minute in front. He nearly came over in this last transit of Ramsey.

We could not feel sure of the placings until the Colliers were through, as nobody would be seriously surprised if Harry and Charlie Collier did a lap at 60 m.p.h. in an emergency, but before long Harry passed through well behind, shaking his head mournfully, and Philipp sang along at his heels, signalling that back tyre troubles had delayed him. C. R. Collier passed through quietly four minutes later, and except for waiting to see whether all the Triumph team could finish, the interest was now over. The victory was tremendously popular in Ramsey, as the Scott and Triumph teams were staying there, and Applebee and Haswell made hosts of friends.

B.H.D.

A. H. Alexander (Indian) leaning over at a great angle on the S bend at Kirk Braddan.

## IMPRESSIONS AT QUARTER BRIDGE AND BRADDAN DEPOT.

THE spectators at Quarter Bridge were treated to the finest exhibition of corner work they have ever seen or are likely to see for some twelve months or so. The difference between the methods employed by the various riders to get round the somewhat awkward bend at this point was most marked, and although some were more skilful than others, the design of the machine in many cases made it far easier for the rider. For example, the Scotts ridden by Applebee and Philipp clung to the road in the way only a Scott can. The Douglases were only slightly inferior in this respect, closely followed by the Indians. The Colliers' style is almost unique; apart from any question of design in connection with the machines, the Colliers

take no risk. C. R. Collier raises his valve lifter and holds it up until he has slowed sufficiently to get round safely; when he is well round, he drops his valve. H. A. Collier adopts practically the same method, but is inclined to hesitate slightly in comparison with his brother. Those who kept close to the kerb got round best, because the new and wider portion of the roadway is banked in the wrong direction for fast corner work, and those who rode on to it through travelling too fast and not keeping close in either made a bad turn or fell.

At Quarter Bridge, very few men used their feet as an aid to getting round; in fact this was quite noticeable by its absence.

E. B. Ware (3½ h.p. Zenith) at Ballaeraine corner.

G. Griffith (twin Humber) was the first to fall, but as he only had a short amount of practice with this machine it is excusable. He was up and off in a moment, and in departing shouted, "I am very sorry."

The first hearty cheer to be raised was for C. R. Collier, and as he came thirty-seventh in the order on the programme it is surprising that those who preceded him gained no great amount of applause. At this juncture a diversion was created by a spectator falling into the river—fortunately quite shallow at this point. The second loud cheer greeted the burly Butler (Triumph), who, by the way, is 4 lbs. lighter than last year.

The Douglasses were the nearest approach to the Scotts in their continuity of exhaust note, thereby showing what a high number of revolutions these engines can attain.

The second time they passed Quarter Bridge, Applebee and J. R. Alexander (Indian) had a dust up along the straight towards Braddan Depot; the Scott easily got away. Franklin (Indian) and Garrett (Regal-Green), who were the next two to make a race of it, disappeared riding almost neck and neck.

#### At Kirk Braddan Depot.

Here we found more interesting incidents occurring, peace only being marred by a wordy warfare between the marshal in charge and a local journalist over a breach of the regulations. The marshal kept his ground, and the Manx penman is probably still unconvinced.

Woodhouse (Regal-Precision) treated us to one of his electric thrills on the S bend at Braddan, and soon after came to grief somewhere on the mountain road. C. R. Collier passed with his engine making a weird grating noise that sounded ominously like timing gear troubles or rubbing brakes, and one or two spectators looked anxious: whatever it may have been, it was cured on the next round.

A number of riders took too long to replenish, and it was quite interesting to watch the difference in the way the

attendants handled the petrol and oil. What struck us more than anything was the expeditious methods employed by the Indian attendants, who were by far quickest.

It is little use having large filler caps and special funnels if the orifice of the petrol can is not equal to that of the funnel and tank. It is also quicker and better to squirt all the oil into the tank with a pump than to spill half of it over the tank sides. Jamieson (Singer), when he stopped, reported a partly seized gear as he could not use the lower ratios. Sirett (Indian) dashed up and gasped one word "tube"; he barely stopped and flinging the tube round his waist was off. Among others who took up fuel, etc., at this depot were Bolton (Rudge), Dixon (Cleveland), Hall (Rudge), Heaton (Blumfield), Garrett (Regal-Green), Ware (Zenith), and Reed (Dot).

Douglas four-speed double control levers.

Douglas four-speed gear, showing outer chain and dog clutches.

Bailey (Douglas) was loudly cheered at this point in the third round, and right well he deserved the applause. Franklin's front wheel was noticed to be wobbling badly as he left the depot; it was not observed by the officials as he rode in, or he would probably have been stopped.

A. H. Alexander (Indian) showed evidence of a spill, his left knee being plastered with mud; luckily he was wearing leathers.

Emerson (Norton) arrived during the crackling of a particularly noisy single, which shall be nameless, and startled the attendants by sirging out his number with a lusty voice. The attendant jumped, and well he might, for no previous competitor had had to shout his own number; there were too many ready and willing to do it for him.

On enquiry C. R. Collier quietly remarked to the officials at Braddan that his engine pulley bearing was giving him trouble, but he might easily have been referring to something of much less importance, so calmly was the statement made.

Returning to Quarter Bridge we met Dixon (Cleveland) pushing his machine, having experienced trouble with the timing gear. A little further on Kickham and Bailey rode past together; on the previous round they were separated by six minutes.

W.G.

H. A. Collier (Matchless) finishing in third place, average speed 46.5 m.p.h.

## THE VICTOR AND HIS MOUNT.

IT was a few minutes to two when F. A. Applebee finished a winner of the Tourist Trophy of 1912, having covered the course of 187½ miles in 3h. 51m. 3s., or an average speed of 48.69 m.p.h., i.e., 1.14 miles an hour faster than O. C. Godfrey, last year's winner. The machine he rode, a two-stroke two-cylinder two-speed chain-driven Scott, shod with Continental tyres, had a capacity of 486.6 cubic centimetres, the smallest engine in the race, excepting the three Junior machines.

Chatting with the winner immediately after the conclusion, he told us that his machine had run faultlessly throughout except for a brief period of misfiring in the first lap. Twice he stopped to replenish his tanks at Ramsey, and with the assistance of O. C. Godfrey clocked the record times of 15s. and 14s. respectively. On two occasions his stand fell, but he managed to kick it up on the run. He knew his position every lap, as he had arranged with his father, F. W., to signal to him. "There were no incidents at all," Applebee said in response to our query. It was a case of "sit fast and hold tight" throughout. Still, judging by the way the Scotts held the road, thanks to their low centre of gravity and smooth running engine, there was less difficulty in holding on than in the case of most of the other leading competitors.

Applebee once ran on to the footpath at Willaston corner, but he did it purposely to avoid the gutter. His radiator was only just warm at the finish, proving the efficiency of the water-cooling apparatus. Surely Godfrey and Applebee are ideal partners, winners respectively in 1911 and 1912.

Mr. Alfred A. Scott, the designer of the machine bearing his name, saw Applebee's performance, and was naturally highly delighted. In face of strong opposition, Mr. Scott was brave enough to abstain from signing the manufacturers' bond, and his independence of spirit has brought his machine the finest advertisement it could possibly have had.

Questioned as to whether the gear-driven rotary distributor valve would eventually find a place on the standard machine, Mr. Scott said that it certainly improved the flexibility and general running, but he did not like what he called the "abominable gear wheels." Eventually, however, it might be

adopted. The Scott pistons were noticeably clean. Three diagonally cut rings, two above and one below the gudgeon, were used. The gear ratios were 3 and 4.8 to 1.

First and second to finish, F. A. Applebee (Scott) and J. R. Haswell (Triumph).

## THE FIRST SINGLE-CYLINDER RIDER.

JAMES R. HASWELL, of Crick, near Rugby, put up a magnificent ride. By reason of his many records at Brooklands, he was regarded by many as having a splendid winning chance, and his opening laps confirmed the belief. Haswell rode fearlessly and cornered in true racing style, several times hitting his right foot-rest on the ground owing to laying over at an acute angle.

## Practically a Non-stop Run.

He enjoyed a non-stop run except for two halts to replenish at Ramsey, although bothered by a stretched exhaust lifter wire. His Dunlop tyred Triumph was standard throughout except for the Starney-Archer two-speed gear and also a detail in connection with the carburettor, which had a receptacle underneath the float chamber containing a gauze filter. He used a rubber petrol pipe. The engine was in wonderfully good condition at the finish, the domed-top piston having only one step cutting at the top and drilled with oil holes. Gear ratios of 4 and 6 to 1 were used.

## AT THE PALACE.

Motor cyclists attended in their thousands at the Palace on Monday evening, when the Clerk of the Rolls handed over the trophy to Applebee, who was cheered to the echo. Much amusement was afforded when efforts were made to persuade Applebee senior and Haswell to make speeches. Major Lloyd said he hoped that a more strenuous and more interesting T.T. would be held early in June next year. (Cheers.) The awards were then announced as follow:

F. A. Applebee (Scott) the Tourist Trophy, £40, and a gold medal.

J. R. Haswell (Triumph) £20 and a gold medal.

H. A. Collier (Matchless-Jap) £10 and a gold medal.

J. A. Hoffman (Triumph) Private Owners' silver cup.

Gold medals were awarded to C. R. Collier (Matchless-Jap), J. A. Hoffmann (Triumph), J. W. Adamson (Triumph), J. R. Alexander (Indian), C. R. Martin (Triumph), A. H. Alexander (Indian), and Alister Kirk (Triumph).

The consolation prize presented by the proprietors of the Palace to the favourite (decided by vote) who did not finish first was awarded to Frank Philipp (Scott).

## CLUB NEWS.

## Evesham M.C.

Result of reliability trial: 1, D. Young (8 Morgan Runabout); 2, F. I. Willmott (8 Morgan Runabout); 3, F. Sharp (3½ B.S.A.).

## Stockport and District M.C.C.

A reliability trial was held on the 23rd ult. over a course of 115 miles. Results:

SIDECAR CLASS (h.p.s. 100).—1, H. Greenhalgh (Matchless), 97 marks; 2, J. Collier (Clyno), 89; 3, F. T. Lees (Rex-Jap), 86.

SOLO MACHINES (h.p.s. 100).—1, H. Marsden (5 h.p. Matchless), 88 marks; 2, J. Harding (6 h.p. N.S.U.), 86.

## Birmingham M.C.C.

The open reliability trial for passenger machines will be held on the 20th inst. Particulars may be obtained by application to Mr. H. J. Cox, 21, Stirling Road, Edgbaston.

## Wisbech and District M.C.C.

A club has recently been formed in Wisbech under the above title. Various social runs and competitions have been held, amongst them the following:

May 29th.—Flexibility hill-climb.—Single-cylinder class: 1, Brown (3½ Triumph); 2, Brooks (3½ Triumph). Open class: 1, Clayton (2½ Douglas).

June 19th.—Petrol consumption trial on formula: 1, Mott (8 Bat), 90 m.p.g.; 2, Crabtree (3½ Rover), 140 m.p.g.

## THE VICTORIOUS COMPETITORS AND THEIR MACHINES.

F. A. Applebee (two-stroke Scott), the T.T. winner.

Second, J. R. Haswell (3½ h.p. Triumph), first private owner and first single cylinder.

H. A. Collier (Matchless-Jap), third in order of speed.

Fourth, Charles R. Collier (Matchless-Jap).

## T.T. TRIFLES.

Some of the Junior twins accelerated perceptibly better after a corner than most of the Senior singles

It is unusual for Franklin to fall. He had two on Monday—one at the Bungalow, and again at Bray Hill, which buckled his front wheel so badly that he was stopped.

The Triumph gear ratios were 4 and 6 to 1 (the bottom gear being disconnected), and the riders changed down at every corner to obtain rapid acceleration.

E. C. Paskell's happy and original idea of entering a Junior machine in the Senior Race on behalf of the Colmore Depot provided most excellent results for comparison. Owing chiefly to non-delivery, there were actually three Junior machines in the Senior Race—two Douglases and a Humber.

David C. Bolton is ever unfortunate in T.T. races. This year he rode magnificently on his Rudge-multi and had gained fourth position on the fourth lap. Everybody was sorry when it was learned that he had broken a valve at Sulby Bridge on the last time round.

A. S. and W. Jones were the two first men to turn up at the start, both with lady passengers on the carriers.

After the Douglas win several leading manufacturers resolved to standardise the belt-cum-chain drive for 1913.

S. F. Garrett (Regal-Green) started with the unlucky No. 13. He started well but, singularly enough, finished thirteenth. He had at least two tumbles.

The binding with insulating tape of all the likely parts to shake loose, such as mudguard stays, etc., was a smart move on the part of the Indian competitors.

The Singer tank cushion and knee grip combined was a good little fitment; it prevented any vibration of the tank against the top tube.

Geo. Griffith's little Humber showed up well in the Senior Race. He told us that he passed more than one Senior competitor on the level stretches, and in contrast to the belt troubles experienced by the riders of this make on Friday, his Pedley belt was untouched throughout.

## Club News.—

## Essex M.C.

The annual twenty-four hours ride from Woodford to York and back will take place on August 30th and 31st, when the moon will be at its full. The route will be *via* Cambridge, Huntingdon, Grantham, and Doncaster.

## Westmorland M.C.C.

A petrol consumption competition was held on June 20th over a course of thirty-six miles. Result: 1, C. Cumpstey (New Hudson); 2, H. B. Harrison (Rudge); 3, T. O'Loughlin (Rover).

## Middlesbrough and District M.C.C.

Ten competitors completed the course in the annual 200 miles reliability trial. The route was a difficult one and comprised Ormesby Bank, Birk Brow, Whitby, Scarborough, York, Harrogate, Ripon, Bedale, and Northallerton. Result: 1, J. Dale (3½ Triumph); 2, W. Armstrong (3½ James and sc.); 3, J. Gilchrist (3½ Zenith); 4, E. Young (3½ Scott).

## Chorley and District M.C.C.

A hill-climb was held on the 19th ult. at Rivington, on a private road, by permission of Sir W. H. Lever. Results: Solo Class.—1, J. Cowsill (3½ Rudge), time 49s.; 2, T. Bentley (3½ Triumph), 66s.; 3, J. Leach (3½ James), 70s.

Sidecars.—1, T. Bentley (3½ Triumph sc.); 2, J. Cowsill (3½ Rudge sc.); 3, J. H. Yates (3½ J.W.C. sc.).

## North-west London M.C.C.

The members' hill-climb was successfully run off on Saturday, June 22nd, at a new hill near Dunstable, which provided good sport.

The results on formula  $\frac{C \times T}{W}$  worked out as follows:

## 350 C.C. AND UNDER.

	Fig. of merit.	Time.
1. G. E. Purchase (2½ Douglas) ...	18.5	20½
2. J. Gibbs (2½ Humber) ...	18.7	18½
3. F. L. B. Dyne (2½ Douglas) ...	22.3	27

## 500 C.C. AND UNDER.

1. J. Gibbs (2½ Humber) ...	18.7	18
2. E. L. Buchanan (3½ Norton) ...	20.0	13½
3. W. C. Knight (3½ Triumph) ...	20.1	13

## OVER 500 C.C.

1. W. Cooper (3½ Bradbury) ...	23.0	14½
--------------------------------	------	-----

## PASSENGER MACHINES.

	Fig. of merit.
1. A. J. Dreydel (5 Ivy-Precision and sc.) ...	29.4
2. F. J. Wilmott (8 Morgan Runabout) ...	31.7

The French tour will start on August 2nd, and a second party will be arranged for August 3rd if necessary. The Circuit du Rhone Race is to take place on August 11th, over a very sporting course of about 120 miles.

Dublin and District Motor Cycle Club Novices' Trial  
P. Beattie (3½ h.p. Rudge) leaving Inchicore.

## Dewsbury M.C.

This newly formed club held a knock-out hill-climb on the 25th ult. The winner of the handicap turned out to be Captain G. J. Newsome (3½ Rover and sc.), 28s. start. Results on time; 1, F. H. Dunston (3½ Rudge), scratch; 2, C. Sydney (3½ Bradbury), scratch; 3, W. J. M. Sproule (3½ P. and M.), 6s.

W. Woods (Triumph) and N. O. Sresby (Rudge) starting in the class for Standard Singles in pairs at the Chesterfield and District M.C.C. hill climb, held on the 26th ult., at Stone Edge.

## Leicester M.C.C.

On the 20th ult. members and friends, numbering altogether about thirty, paid a visit to Birmingham for the purpose of inspecting the Armstrong Gear Co.'s works.

## Daimler M.C.C.

The annual reliability and speed-judging contest will be held on July 13th. Competitors will be required to make four circuits of a course at a speed of twenty miles per hour, the total distance being about 100 miles.

## Surrey M.C.C.

The results of the reliability trial for the Triumph challenge cup, held on the 18th and 19th of June, from Guildford to Exeter and back, are as follows: 1, H. Mitchell (3½ Premier), Triumph cup and Bates tyre; 2, J. H. Sparks (3½ Trump-Jap), gold medal; 3, R. E. Eley (3½ Bradbury), silver medal; T. G. Meeten (3½ Rudge and sc.), special gold medal for passenger machines. P. Kork (3½ Triumph), S. Holbrook Crow (3½ Zenith), E. Cox (3½ Zenith), H. R. Owtram (3½ Triumph), C. R. Nash-Worham (6-8 Zebra), and C. J. Feeny (3½ Triumph), bronze medals.

## Doncaster and District M.C.C.

Some good sport was witnessed at the recent hill-climb. Results:

Class 1 (touring lightweight singles).—1, J. A. Bassett (2 Humber); 2, G. Brenchley (2½ A.J.S.).

Class 2 (touring lightweight twins).—1, F. Roberts (2½ Humber); 2, B. Crouch (2½ Humber).

Class 3 (T.T. single-cylinder, fastest time only).—1, E. Goult (3½ Rudge); 2, D. Gill (3½ Calthorpe); 3, T. Durant (3½ Norton).

Class 4 (standard touring single-cylinders).—1, L. Baker (3½ Rudge); 2, G. Brenchley (2½ A.J.S.); 3, F. Dunstan (3½ Rudge).

Class 5 (twins up to 1.100 c.c.).—1, J. H. Wilkinson (5 Matchless), fastest time of the day.

Competitors who made fastest time in Classes 1, 2, 3, 4, and 5 ran off for the final for the Humber gold medal, and were handicapped according to the difference of their previous fastest times. The competitors who rode were J. A. Bassett, F. Roberts, E. Goult, T. Durant, and J. H. Wilkinson. F. Roberts was the winner of the medal on his 2½ h.p. Humber.

# LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

## Hill-climbing.

Sir,—If some of your readers want to try a mountain climb let them attempt Moel Fawmau, near Mold, Flint. This was ridden up some years ago by J. Edge, of Liverpool. It is 1,820 feet high.

MOLD.

## Motor Cycle Insurance.

Sir,—My attention has been drawn to the paragraph in your issue of June 20th respecting the recent improvements in the A.C.U. policy which may have given the mistaken idea that the A.C.U. have on their staff an insurance manager. This is not absolutely correct.

Mr. A. H. Priestley, of 199, Piccadilly, W., is not on the staff of the Union, but he is the originator of our insurance scheme, and he renders valuable assistance to the Union by dealing with all enquiries on insurance matters in his official capacity as West End manager of the Liverpool Victoria Insurance Corporation, Ltd., who issue our recommended policy.

T. W. LOUGHBOROUGH, Secretary A.C.U.

## Dangerous Driving.

Sir,—With reference to the letter from "C 5546" in the issue of June 20th it is a little difficult to understand your correspondent's point of view, as he is apparently one of the first victims of the increased activity of the Cheshire police, referred to by "Within the Legal Limit." The latter was protesting against the reckless driving of a few motor-cyclists, which is likely to bring trouble upon all riders, the majority of whom no doubt drive with due care and consideration. It would therefore appear that he should be supported by all who have the true interest of the pastime at heart.

"C 5546" makes some sweeping assertions about the nature of the traffic on the Saturday in question. The danger on the part of the Manchester Road referred to lies in certain cross roads, which appear to those driving along them to be main roads, and I presume "C 5546" is not prepared to assert that there was no traffic along these.

M.

## Should Ladies Race?

Sir,—One more word, please, to appease the mind of Mr. Holmes on a few subjects on which he apparently feels sore. Firstly, my letter was not intended to give offence—in fact that is my way of being pleasant—and I do not liken pram pushing to motor cycle racing. I use the simile as a form of contrast; he really should read a letter through twice before answering. My "racing career" evidently worries him. My only entry was at the Coventry and Warwickshire M.C.'s hill-climb last September, where I finished among the "also ran"—fifth out of five. If the same club have a ladies' class this year, I hope again to enter, and maybe shall finish last. And now Mr. Holmes, anything else?

(Miss) MAY WALKER.

Sir,—May I explain the difficult points of my letter to Miss May Walker. The allusions to the Suffragettes and coal strikes are not shots but analogies. It is not suggested that ladies racing has anything to do with either. I am not a minor, I only wish I was. "The usual thing" was a quotation, that is why it was in inverted commas. The object of these illustrations was to show how difficult it is to please all parties in these days. Even in Æsop's time a man tried hard but failed. Perhaps if Miss Walker had read my letter twice she would not have missed these rather obvious points.

ACTON HILL.

B18

## The M.C.C. Team Trials.

Sir,—I was an interested spectator at the M.C.C. team trial at Daventry on June 15th, and am fully in accord with your praise of the way it was managed. Might I, however, with all the humility of one who does not know the difference between an internal cam and a carburetter, make a suggestion for similar future events? Would it not be better if all members of the competing clubs who were not themselves taking part in the trial were debarred from travelling over the course while the contest was on?

Suppose a reserve, riding with fruit for his friends, meets his club team on a quiet stretch of road. Suppose he knows by his watch that they are so much too fast or so much too slow, even a good sportsman would be tempted to speak. Why not forbid him to go on the course and remove the temptation.

H. S. TWELLS.

## Petrol Consumption.

Sir,—I have often checked the consumption of my 1910 Triumph (fixed engine) by the distance run on a measured amount contained in a special drum. I never have any difficulty in running 95 m.p.g. in undulating country out here. I cannot say that I have ever checked it on long hill-climbs. I did 138 miles on a full tank one day, and then there was a small amount over; that works out at 112 m.p.g.

Punjab, India.

R. D. E. DARELL.

Sir,—I enclose photograph of my Indian and sidecar containing mother and two brothers (not counting luggage). We have two Indians in our house. What I wanted to write you about was petrol consumption. I ran with above load to Berwick on May 24th, 1912, not attempting to economise in the least (Berwick to Newcastle is something over sixty-

The writer of the accompanying letter with Indian sidecar and passengers.

nine miles). I ordered one gallon of petrol at a garage in Berwick, expecting the tank would take 1½ gallons, but it would not take a gallon. That is to say that it ran on less than a gallon nearly seventy miles! I am only sixteen years old, and have had four machines, including one 2½ and one 3½ New Hudsons, but prefer chain drive for sidecar work.

BAXTER ELLIS.

**The Price of Petrol.**

Sir,—The letter of A. W. Gamage, Ltd., in your issue of June 20th is very interesting, but if the suggestions contained in it are carried out it appears to me it can only be at the cost of eliminating the ordinary dealer and creating a monopoly for a few of the large houses. The ordinary dealer, especially in the country, is at the mercy of the manufacturer or his wholesale agent, and it is impossible for him to dream of fighting them. Every increase of price in the supply to him means that same increase, plus an extra percentage for profit, to the itinerant motorist. It is doubtless hard on the motorist, but the retailer is obliged to live, except, of course, motorists grant the monopoly to such establishments as A. W. Gamage, Ltd., and knock the retailer out altogether. DEMOS.

**Another Road Danger.**

Sir,—Some additional legislation with a view to the proper regulation of heavy traffic on country roads is urgently required.

On the 22nd ult. while driving a motor cycle with sidecar from Buxton towards Bakewell, I overtook three heavy motor charrs-à-banc. After considerable trouble, I managed to pass them, but was immediately afterwards blocked by a herd of cattle and had to stop my engine. The gradient was fairly stiff, and before I was able to start again, all three vehicles were again ahead. As there was a good deal of low gear work still before me, I decided to let the engine cool down and give the cars of Juggernaut an opportunity to get well ahead. I hoped that they would turn off somewhere, but half an hour later a dust storm in front indicated that my hopes were in vain.

The road was now level or slightly down hill. I was going well and decided, justifiably I think you will admit, to pass. I gave several warnings with the horn, and noted with satisfaction that the omnibus drew slightly to the left. The passengers in the rear had seen me, and I judged that the driver had been informed of my approach. I had drawn level with the front wheel when the driver, who afterwards blamed some of the passengers for talking to him, seemed to let his wheel follow his eye to the right, with the result that my sidecar was struck and lifted right over the bicycle. I found myself on the road, and my wife, who had made the longer journey over the bicycle, joined me an instant later. Had we been thrown the other way, the accident would almost certainly have proved fatal to one or both. As it is, my machine is a total wreck.

Now, sir, I think, as a result of my unpleasant experience, that something ought to be done to compel the owners of long noisy vehicles to have some responsible person at the rear. The driver declared that he could not hear my horn, and I believe that he was telling the truth; twenty yards behind I could not hear my own engine, and the cut-out was open.

I may add that, while a few of the passengers showed us kindly consideration, the tone of the crowd was distinctly hostile. D. H. MCCURTAIN.

**Overloading.**

Sir,—I was much interested in your leaderette in *The Motor Cycle* of June 20th on "Overloading" with which I heartily agree, but you mention the 2½ h.p. twin-cylinder machine as being the most suitable type for the average beginner. I venture to think that a 2½ h.p. single-cylinder is the best type of machine for a novice, as it is certainly easier to understand in the first place and simpler and less expensive to keep up.

As regards simplicity, there is nothing to choose between a 2½ h.p. single and a 3½ h.p. single, the chief difference being that a 2½ h.p. would be easier and lighter to handle and push about. Regarding the practice of overloading by passenger-carrying on the carrier, I am glad to read that you do not approve of it as a regular thing, but I think that the manufacturers themselves are partly to blame, as one cannot help noticing the photographs appearing in the advertisements depicting their particular make of machine carrying as many as six people up a steep hill. Well the individual motor cyclist is led to think that if the manufacturer advertises the machine in this way and appears to hold with it, surely there is no harm for him to carry only one person on the carrier.

I contend that the 2½ h.p. and 3½ h.p. motor cycles are made to carry one and not two or more, as the tremendous weight, imposed by passenger-carrying, is bound to tell on the machine in the end.

A 3½ h.p. motor cycle with a two or three speed gear is quite capable of taking a sidecar nearly everywhere as we all know, but the strain of a sidecar is, I think, less severe on the machine than continuous passenger-carrying on the carrier, beside being far safer. S. W. TURNER.

[We recommended for an unmechanical novice 2 or 2½ h.p. —Ed.]

**Motor Cycles in the Malay States.**

Sir,—It has occurred to me that a letter dealing with motor cycling as practised in this country might prove of interest to your readers.

This country, of which most people at home knew next to nothing a few years ago, has developed very rapidly lately, due to the "rubber booms," and, under a rich and progressive Government, not the least important direction this development has taken has been in the provision of a system of roads which are, for the most part, well-engineered and wonderfully good of surface considering all things. In consequence motoring has been eagerly embraced by all who were in a position to indulge in it.

Speaking for myself, I have had many enjoyable trips, both in friends' cars and on motor cycles, of which I have

A New Hudson and Lincoln-Elk outside the writer's bungalow.

owned two. My first mount was a 1909 Triumph, and very trusty and handy I found it. Recently I have invested in a 1912 New Hudson, 3½ h.p., with Armstrong three-speed gear, which I purchased through the local agents, Hock Leong Hin, Kuala Lumpur. I may say straightaway I could not wish for a mount more suited to the peculiar needs of this country. Even on the main roads, well engineered though they be, one constantly meets with sharp bends, nay, veritable "Devil's Elbows," in the middle of steep hills, and if one has to cross one of the many passes it means a succession of sharp corners, which can only be taken at a crawl, whether ascending or descending; these are nightmares to riders of single-g geared machines.

I always look forward with pleasurable anticipation to the weekly advent of *The Motor Cycle*.

Federated Malay States.

NEW HUDSON.

## Speedometers and Wheel Sizes

Sir,—With regard to Mr. C. R. Woolley's letter, which appeared in your issue of June 20th last, and the remarks put forward in the said letter referring to one of our speed indicators, we would like to remark that we have always recognised the fact that there is a difference between the actual and nominal size of a tyre. We proved this to be the case as the result of experiments which we conducted on the road before placing our motor bicycle speed indicator on the market, and in order to compensate for this difference we altered the ratio of our gearing.

We would add that we have found from experience that all tyres of a given diameter are not identical in size. This, combined with the fact that certain riders always run with their tyres inflated to a pressure which is either above or below the average, makes it exceedingly difficult to provide against slight inaccuracies in certain cases. At the same time, we are always willing to supply special gearing, exactly suited to the requirements of a particular machine, if, when ordering, the purchaser will give us the proper information. The most useful information to supply is the exact distance from the ground to the centre of the wheel with the tyre normally inflated and with a rider seated in the saddle.

If your correspondent will be so good as to communicate with us in the matter of his speed indicator, we shall be only too pleased to forward him a gear wheel to replace that already attached to the spokes of his front wheel, which, when fitted, will correct the discrepancy which he has noticed in the readings of his speed indicator.

THE COWEY ENGINEERING CO., LTD.

Sir,—Under the above heading your correspondent C. R. Woolley comments on the variable reading of a speedometer due to the variation in tyre size. Although the remarks do not specifically refer to our Jones speedometer, we feel it incumbent upon us to point out that in our Jones speedometer, as in our Veeder cyclometer, allowance has been made in the gearing for the average compression of a pneumatic tyre actually correct to size, but it is, of course, well known that so-called 26in. tyres, for instance, vary considerably in their diameters, and, of course, the method of inflation will also have some bearing on the wheel travel. It would be obviously impossible to supply a speedometer that would automatically adjust itself according to the actual tyre diameter. It is, therefore, up to the party concerned to give the manufacturer with his order the actual, not nominal, diameter or travel of the tyres, and we have no doubt that our competitors, like ourselves, would be able to supply an instrument correctly geared to suit.

In the case of our Veeder cyclometer, which your correspondent touches on, it is true we have standardised actually a 27 $\frac{1}{2}$ in. cyclometer as for a 28in., as it was found in the stress of competition that the tyre manufacturers had gradually reduced the size of their so-called 28in. tyres, but these are not parallel cases. In the one you have a general cut down in tyre size. In the other, in the case of motor cycle tyres, the position is that such tyres may vary one way or the other, according to the make and design of the tread. One tyre may be as much over-sized as another may be under-sized. That, we think, is where the difficulty comes in. The remedy, therefore, rests with the party ordering the speedometer to be careful to state the actual diameter of the tyre, as we have endeavoured to explain above.

MARKT AND CO. (LONDON), LTD.

The latest type of Crescent Runabout with flush sided body. This cyclecar is now friction driven and can be supplied with tandem (as shown) or sociable seating.

## British Motor Cycles in Canada.

Sir,—As a constant reader of your paper, I take the liberty of writing you just to comment on a leader which appeared in an early May issue. From the address below you will note that I am located in the Far West, and so far as applies to Vancouver I wish to endorse your warning to the British motor cycle makers with regard to this important trade out here. One year ago motor cycles were few and far between in our streets, but a great change has come about, and there seems at present to be a perfect craze for these machines.

As an enthusiastic motor cyclist, and having been connected with the trade in the old country, I am surprised that so few British machines are seen amongst the hundreds that now throng our thoroughfares. Nine out of every ten are American so far as I can see, and this in spite of the fact that the British makers have a large preference in duty. On the occasion of my ordering an English machine of a well-known make I was informed that the home makers were so busy with home orders that I might have to wait a considerable time for my machine. Since then, through the courtesy of an agent, I have had my machine despatched, and I am hoping to be able to show some of my friends here that the British motor cycle can hold its own with anything.

There is a great future for the motor cycle in B.C., and this market is certainly worth looking after.

Wishing you every success with your up-to-date paper, which I never fail to have sent me.

Vancouver, B.C.

AUTO.

## Whose was the First Ascent?

Sir,—Having read with interest accounts of the various attempts to scale the famous Bwlch-y-Groes (Dinas Mawddwy) with a sidecar machine, my friend, Mr. J. Mills, decided to attack the hill with his 6 h.p. Enfield sidecar.

Accordingly, at 10 a.m., on Friday, June 21st, a start was made for Bala, the sidecar being occupied by George Yarnold, and I accompanied the party on a Triumph.

Bala being reached without incident, we pushed on and arrived at the summit of the Pass, both machines having climbed the "easy" side without difficulty.

The Triumph was then abandoned, and descending as far as the gate on the carrier of the Enfield I sat down to wait.

The machine disappeared from sight, round a bend, and after what seemed an age, could be distinguished returning up the steep gradient at a good speed.

The first attempt was, however, doomed to failure, for on reaching the steep section, after the gate, Mills, in his excitement, fouled his levers, and the machine stopped dead.

A fresh start was made, and this time all went well, the J.A.P. engine pulling wonderfully, and after the worst patch was covered, accelerating to the summit.

The latter portion of the climb was witnessed by a Mr. Hugh Morris.

I should like to say, in conclusion, that although this pass is without doubt an extremely steep and lengthy climb, we are of the opinion that the hill on the road from Llanfair Talhaiarn to Llansannan (the former village is five miles from Abergele) is considerably steeper, and the surface is much worse. This hill is about three-quarters of a mile long.

FREDERICK WELLS.

Sir,—Regarding my climb of Bwlch-y-Groes, I might say that when I was returning down the easy side after successfully climbing the pass, both Mr. Lord and myself stopped at the same spot and chatted together. I told him I had climbed the pass, and my friend, Mr. Fredk. Wells, has written you an account of the climb. He (Lord) was then going up with Mr. Owen, of Bala, in the sidecar, whom he afterwards successfully carried up the pass as a passenger.

Lastly I might mention my gears were standard, which are, I believe, 5 and 9 to 1.

JAMES MILLS.

P.S.—I think the above account proves that mine was the first witnessed sidecar climb of the pass.

## SUMMARY OF CORRESPONDENCE.

Mr. L. C. Wilks, whose letter on "The Danger of Uncontrolled Dogs" was inserted on June 20th, writes to say that he is not a member of the C.T.C., but that "The Dog's Black List" is under the control of the N.C.U.

Mr. R. H. Adams writes that the mileage mentioned in his letter of last week should read 11,000 not 1,100

# Bowdenism

(The Science of Simple Control.)

## Genuine Bowden Control Wire.

Beware of Cheap and Inferior Imitations.

THE True and Perfect Quality of BOWDEN WIRE MECHANISM attained only through fifteen years' experience is marketed under the following Trade Marks:

**BOWDENITE**—The popular style of black waterproofed wire used on all motor cycles.

**BOWDENSILVER**—Similar to the above but having an armoured wrapping of white metal ribbon to give further protection. This is also made with brass wrapping under the style of Bowdenbrass.

**BOWDENAMEL**—Used for work where protection from the ravages of weather is not essential. The wire has merely a coating of enamel.

**BOWDENOIR**—Same as above, except that the wire is oxydised.

**BOWDENSULO**—Similar to preceding, but with a "tinned" finish.

Having regard to the serious functions to be performed by BOWDEN WIRE, we *Refuse to Lower Quality.*

See the above marks on  
the Genuine Article.

Note—Genuine  
Trade Mark  
has no place  
name under it.

We shall be glad to send our  
1912 Catalogue on request.

## AMONG THE ACCESSORIES

### The A.K. Sporting Belt.

The A.K. Company's chain belt can be purchased with a tool bag attached if desired. The illustration shows the tools and spares which may be carried in the bag. It will hold just those things the sporting type of rider is likely to

need in a hurry, such as an adjustable spanner, a belt fastener, repair outfit, sparking plug, and a piece of spare belt. The A.K. Manufacturing Co., 36, Swaine Street, Bradford, supply the belt and tool bag, but not the tools.

### Tandem Seat.

W. J. Bradley, 116, Regent Street, Leamington, is the maker of a new pattern tandem seat, which is provisionally patented. The seat fits over the back wheel like a pannier, thereby enabling the passenger to sit on it facing right or left, or to straddle it, as desired. It is

made of wicker or cane, and covered with waterproof material, weighs 11 lbs. only, and has been tested to carry over 4 cwt. A foot rest is fitted to each side, and

when the seat is in position the rear wheel is covered from top of mudguard to centre of hub on each side, thereby forming a dress guard for lady passengers. It is supplied with or without a spring cushion and at a moderate price.

### Clutch Control. Exhaust Siren.

Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, W., inform us that they have lately brought out a handle-bar control to operate the clutch on Douglas machines. The device can be fitted by the rider or by Messrs. Taylor and Co. for quite a small sum.

Another accessory introduced by this firm is an exhaust siren, a neatly designed alarm which is foot operated. This is quite a novelty in the way of methods of giving audible and sufficient warning.

### A Novel Mascot.

A novel mascot has been submitted to us by Maude's Motor Mart, 136, Great Portland Street, W. This mascot is a metal figure of a policeman, and in front is a small screw propeller. As the figure travels through the air, on the front of a motor cycle at speeds above four or five miles an hour, the propeller revolves and works the arms of the figure up and down. Seven-eighths or one inch clips are provided for attaching it to the handle-bar.

### A Three-ply Leather Belt.

J. T. Bradford, 91, Burnley Road, Colne, Lancs., has sent us a sample of leather belting which is so constructed that when passing round the engine pulley the bottom layers are compressed as little as possible, so enabling the greatest flexibility and preventing belt slip. Thin rivets are used, so that the strength of the leather is not destroyed by cutting large rivet holes, and wide copper washers on the top layers keep the leather from doubling up under driving stress.

Novel tool kit, made by Middlemore & Lampugh. Each tool is separated from its neighbour by a strip of leather, the whole being locked tightly together by the spring shown, which is pushed into position at the end of the kit.

### A Convenient Spare Tank.

The Service Company, Ltd., 292-293, High Holborn, W.C., have introduced a torpedo-shaped spare petrol tank, designed to be fitted to any convenient tube of a sidecar, to which it is fastened by brass straps. It is provided with a filler cap of ample size and a petrol tap.

### A Collapsible Valise.

A collapsible metal box or valise is made by the "Holero" Company, 740, Seven Sisters Road, N. This measures 7in. x 7in. x 4½in., and is intended to hold

the usual amount of toilet necessaries for one night's use. When not in use the box may be made to fold entirely flat. Loops are provided for straps to fasten the box to the luggage carrier, whereon it may remain permanently if desired.

### An Electric Motor Cycle Horn.

The Fortavox is the name of a motor cycle electric horn just introduced by Ward and Goldstone, Springfield Lane, Salford, Manchester. It is small and

neatly enamelled black, and consequently is no trouble to clean. It is worked by means of a dry battery, and when the switch is depressed emits a penetrating but not unpleasant sound. The wiring is of the simplest description, and if a sidecar combination be used, switches may be provided both for the driver and the passenger. If used with a sidecar a rather larger battery may be carried with advantage.

# My Most exciting Ride: No 5. F. W. BARNES.

Interrogated by L.C.

"I HAVE had so many exciting rides," said F. W. Barnes, when I tackled him on the subject, "that I could fill a volume, but there was one which I shall never forget. Most rides, currently exciting, become mere subjects for amusing anecdotes in retrospect, but my sidecar record ride with Weatherilt in the passenger seat at Brooklands on March 7th was nerve-racking enough. You must realise the enormous strain on the engine, frame, and tyres with a sidecar, going all out on Brooklands, with its many rough patches, before you can have any idea of the prevailing conditions in a two hours' ride at nearly fifty miles an hour. We had made adequate arrangements, and Weatherilt, instead of lying down in the car, had to replenish the oil and petrol tanks by means of a special appliance, and keep his eyes on the sidecar wheel, the watch, and lap scoring card."

"We soon accelerated to top speed, and were on the mile a minute mark after a steady lap. After seventeen laps Weatherilt with difficulty managed to replenish the petrol tank from a spare two-gallon tin, but with two more laps to accomplish in order to get fifty miles into the first hour, we ran short of oil. My passenger was struggling with the syringe and the spare oil, while I was fumbling about in order to receive it in the oil tank. As a fact I received it all over my face, for the jolting and the wind prevented Weatherilt from getting the oil into the tank and we both of us got smothered. Anyhow we stopped just before the expiration of the hour and loaded in the ordinary way. We were so oily that our fingers were like thumbs, and when we restarted the machine slipped out of my hands and I had to make a dash for it, landing in the saddle with as much luck as judgment. As we passed the time-keeper, I turned to Weatherilt to shout in his ears a query as to whether we had managed the fifty, and I never saw such a sight in my life. Weatherilt was an oily mass, barely recognisable, and I suppose I must have been nearly as bad. What with the oil in our eyes, and the attempts to get some in the tank, we

lost count of the laps, and simply went all out, bouncing about like a cork on the ocean. On some parts of the track we were doing nearly seventy, and it was at our greatest speed that I, with horror, heard Weatherilt say something about the sidecar wheel coming off. We were then passing under the members' bridge, and the bend was rather sharp. Like a shot I grabbed the exhaust lifter, shut the throttle, and applied the brakes, but these manoeuvres did not seem to check the speed, and every moment I expected

to see the sidecar wheel part company with the combination. Then we began to slow up with me feeling as scared as ever I was. Another yell—'Go on,' said Weatherilt, 'we're slacking.' With what little breath I had left I shouted 'What's the matter?' to which Weatherilt replied that the sidecar wheel was coming off—the track (lifting)! Oh, the relief! I opened out again, but it was an experience not to be forgotten. A bit later we stopped for more petrol. On again at a fine turn of speed, and we were getting near the finish when the belt fastener broke. On stopping, I turned to Weatherilt for the spare

belt, but he was stretched out in the sidecar, having received a blow from the belt which had temporarily stunned him. He had a nasty bruise on his forehead, and I began to administer first aid, when he came round and insisted on finishing the ride, which, after I had fitted another belt, we did, completing 100 miles in just over two hours."

"Another little incident which occurred during my racing career was a fall at Brooklands while doing seventy-two miles an hour, owing to a burst front tyre."

"On another occasion I ran into a cord attached to a kite which had strayed from the aviation sheds. I was doing sixty miles an hour, and the cord cut through my clothes and then my hand as I tried to pull it away from my throat."

F. W. Barnes, who is the inventor of the famous Gradua gear and the works manager of the Zenith Company, secured fifty-three first prizes in 1911, and so far this year has secured fifty-eight.

# Stepney Road-Grip Tyres

## FOR MOTOR CYCLES.

The extraordinary success of the Stepney Road-Grip Tyre for Motor Cars has encouraged us to put on the market a similar tyre for Motor Cycles, and we guarantee that the same quality rubber and canvas is used in the manufacture of same as that of our Motor Car Tyre.

### PRICES.

Road-Grip Cover, 26 x 2½ in.	....	50/-
Inner Tube	"	9/9
" " butt ended "	....	13/4

The Stepney Road-Grip Tyre will grip the road better than any other form of non-skid, and is more resilient and lasts longer than a Steel-studded Tyre.

NON-SKID

## THE "BURNETT" PATENT SUCTION - CUP TYRE.

### TESTIMONIAL.

30, Upper Sandhurst Road,  
Bristolington,  
BRISTOL.  
March 27th, 1912.

Messrs. The Burnett Motor Tyre Co.,  
Melksham, Wilts.

Dear Sirs,—It is with much pleasure that I express to you my satisfaction of excellent results I have from one of your Special 3-ply Motor Cycle Tyres, which I purchased from you in 1910.

I fitted tyre to the rear wheel of my 4½ h.p. single-cylinder motor cycle, sidecar attached, and ran about 3,000 miles without having the least bit of trouble, not even a puncture. I have since removed tyre to wheel of sidecar, and after 1,000 miles is still in excellent condition.

It is also interesting to note that during the time tyre was running on rear wheel of motor cycle, I used no less than three tyres of well-known makes on front wheel, which caused me no little inconvenience.

I may also add that I found tyre excellent as a non-skid during bad weather and far superior to any other make of tyre which I have ever tried.

Yours truly, W. H. WHITE.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Port Talbot to Woolwich.

**?** Kindly give me the best route and mileage from Port Talbot (Glamorgan) to the East End of London, avoiding as much traffic as possible. What time should it take?—M.R.

Your best route would be as follows: Port Talbot, Bridgend, Cowbridge, Cardiff, Newport, Severn Tunnel Junction, by train to Pilning, then through Chipping Sodbury, Chippenham, Devizes, Upavon, Andover, Whitechurch, Basingstoke, Odiham, Farnham, Hog's Back, Guildford, Shere, Dorking, Reigate, Redhill, Westerham, Hayes, Bromley, Bellingham, Lewisham, Blackheath, Greenwich, ferry to Woolwich, whence you can reach almost any part of the East End of London. This would be better than driving through the whole of London from west to east, as you would have to do by any other route, and it avoids the traffic as far as possible. The distance is approximately 230 miles. We cannot tell you how long it will take, as this depends upon how fast you intend to drive.

## Single Gear Tricar.

**?** I am using a  $3\frac{1}{2}$  h.p. tricar, with two coach-built seats, wheel steering, chain drive, free engine, leather-to-metal foot clutch, single gear, weight about 3 cwt. I have fitted a B. and B. carburetter with No. 32 jet. Would you be good enough to inform me if this is the correct size jet, and, if not, if this is the reason I cannot get enough power to get up a hill with passenger, combined weight about 22-stones? Perhaps you can tell me what is wrong. Further, is it necessary for me to take out a revenue licence for the machine? I use it solely for business purposes, and have a plate bearing name and address, but as I sometimes require one of my travellers to accompany me, I am wondering if I am liable if I take him as passenger in the front seat.—F.W.M.

The size of your jet is about right. Provided that the engine is in good order, it is probably geared too highly. We are afraid you are liable for the revenue tax of £1. To be exempt a machine must be constructed in such a way that it can only be used for commercial purposes—i.e., you should have a box in front for the conveyance of goods, and not a seat.

## Magneto Timing.

**?** I ride an 8 h.p. 1912 Rex-Jap and sidcar (Service Co.) fitted with Roc two-speed gear. (1.) My yearly mileage is about 12,000 miles. After about what distance should the gears be overhauled? (2.) Am I right in assuming that the magneto is at its maximum when the gap between the armature and the pole piece is six millimetres? (3.) With B. and B. carburetter, what is the best size of jet for this combination; top gear, 4 to 1; also what size choke tube? (4.) What is the greatest mileage per gallon to be expected under most favourable conditions? I get 50 m.p.g. (5.) What is the best setting of the magneto for touring with this combination? When the machine arrived from the makers the timing was as follows: With the spark lever fully advanced, the platinum points broke when the piston was in down the firing stroke. The machine would not take more than half throttle unless air was cut off altogether, and I consequently blamed the carburetter, thinking it was starved, and could not get rid of the trouble until I took down the engine after 1,000 miles. The state

of the exhaust valves, the stems of which were burnt almost half through, at once caused me to look to the timing, when I discovered the state of affairs before mentioned. At present I have the magneto timed as follows: Piston on top of compression stroke, lever fully retarded, platinum points at breaking point. With this setting the engine is inclined to knock occasionally on picking up. (6.) Which of Price's and Vacuum oils is best for this machine in summer?—F.G.T.

(1.) We should recommend you to have the gear examined at the end of 5,000 miles. As the gear is well made there should be no parts likely to require renewal, except the bearings. (2.) The gap between the end of the armature and the pole piece should be about 5 mm., and at that moment the platinum points should be about to break. If the gap be any wider the firing will take place earlier. (3.) The correct size jet and choke tube are best found by experiment. Try a .32 jet and .53 adapter. (4.) Fifty miles to the gallon would be about right. (5.) You have set your timing correctly. It was very far wrong before. (6.) Price's Huile de Luxe or Vacuum B.

The Red Cross Service in Paris. A Bedelia used for transporting an injured person from the suturys to one of the hospitals.

## Guildford to Bedford.

(1.) Would you kindly give me the route and distance from Guildford to Bedford? I am a pure novice, having only ridden for three weeks, but I wish to go this way at a future date with a 6 h.p. twin and sidecar. (2.) Are there any tricky hills (I have free engine and two-speed gear)? (3.) Can I avoid all towns with tramlines?—O.A.D.

(1.) Your best route would be as follows: Guildford, Chertsey, Staines, Windsor, Slough, Beaconsfield, Amersham, Chesham, Tring, Dunstable, Amptill, and Bedford. (2.) There are one or two tricky hills between Beaconsfield and Chesham. (3.) We do not think you will be troubled with tramlines on this route. The distance is approximately eighty miles.

## Climbing Birdlip.

I read in *The Motor Cycle* of May 2nd an account of the A.C.U. one day trial, and see that you talk of Birdlip Hill as a mere incident for a modern motor cycle. Would it not be possible to give approximately the gear ratios of the machines in these trials? It would give readers a better idea of a machine's capabilities. I took a trip to Gloucester one day recently in order to see what Birdlip was like. I rode a well-known  $3\frac{1}{2}$  h.p. 1912 clutch model, gear ratio  $4\frac{1}{2}$  to 1. My weight is 10 stones. The result was the machine conked out after about half a mile of climbing. I then lowered the gear to  $4\frac{1}{4}$  to 1, and went down to the foot of the hill and tried again. I managed to get up all right this time, but the engine knocked terribly after the last corner near the top. However, I managed to coax it to the top without using the clutch. Yet you say this hill is a mere slope! By the way, what was the normal gear of the Rover you rode? Do the riders reckon to climb these hills on an ordinary touring gear (referring to single-geared machines)?—D.C.

There were only two single gear machines in the A.C.U. trials, and we are unable to state their actual gears. It is an open secret that competitors in reliability trials gear slightly lower than for touring (probably about 5 to 1), though a very low gear cannot be used on account of petrol consumption and overheating. Competitors are not allowed to alter gear ratios during the trial. The normal gear on the  $3\frac{1}{2}$  h.p. Rover which we were riding was  $4\frac{3}{4}$  to 1. The machine was in full touring trim, and in addition to our own weight in overalls (about 11½ stones) was carrying a small box of luggage on the carrier. The hill was taken on the run without cooling the engine. We have climbed the hill on many modern machines and some ancient, but with the exception of lightweights have seldom geared below 5 to 1. N.B.—W. B. Gibb ( $2\frac{3}{4}$  h.p. Douglas) very nearly reached the summit on top gear.

## Ipswich to London, W.

Kindly inform me of the best route from Ipswich to the West End (Queen's Gate). I have no objection to a circuit to avoid traffic.—G.C.P.

Your route will be as follows: Colchester, Witham, Chelmsford, Chipping Ongar, Epping, to Woodford. At the end of Woodford take the right hand fork and go straight on until you come to Walthamstow (ten-mile limit). Here take the first on the left and second on the right, where you enter the main road to Ware. Turn to the left and take the road leading under the G.E. Railway bridge marked "Seven Sisters Road Station; frequent services of trains to London, etc." Continue straight on till you meet some tramlines with central standards. Here turn right for about fifty yards, and left immediately afterwards. Follow the tramlines with overhead wires to the foot of Muswell Hill. Climb Muswell Hill, and continue straight on until you come into the Great North Road. Here turn left, and take the first turning on the right marked "Private Road," at the end of which turn to the right and you will find yourself on the top of Hampstead Heath. At the

pond turn left, when you enter the ten-mile limit, and descend Fitzjohn's Avenue. At the bottom bear slightly to the right, and go down the wood paving until you come to a public house (Eyre Arms) on the right-hand side, near which there is a public hall. Follow this road round to the left, and then go straight down Grove End Road, on into Lisson Grove, turn right at Marylebone Road, and make your way into Oxford and Cambridge Terrace, take the second on the left, second on the right, and second on the left again. This will bring you into Lancaster Gate, opposite Victoria Gate. Go straight across Hyde Park, coming out at Alexandra Gate, whence you will find Queen's Gate the most important turning on the left.

## Eyeglasses in Wet Weather.

I should much appreciate your advice as to the best method of overcoming the difficulty of riding in heavy rain and being compelled to wear eyeglasses? I have a pair of goggles which fit over my glasses, but the glasses in the former get so wet that I cannot see through them, and I have to stop repeatedly to wipe the glasses dry. I shall be glad of your help.—F.B.

Probably the best thing to do is to rub the glove over the glasses so as to smear the rain and prevent it forming in drops. The trouble may be reduced slightly by wiping the glasses of the goggles or spectacles with a mixture of glycerine and water. This, again, prevents the rain forming in drops.

## EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"G.W.E.C." (Wallasey).—4 h.p. 1912 Rex.

"J.D.D." (Cornwall).—6 h.p. Enfield sidecar for use in a hilly country.

"F.N.Z.A.A." (Wellington, N.Z.).—7 h.p. four-cylinder T.M.C. with and without sidecar. Reliability and suitability for rough work.

## THE POPULAR SIDECAR.

The above group was photographed in the Stockport M.C.C. Reliability Run on the 23rd ult., and shows some of the competing sidecarists at Monk's Heath—the second control. Matchless and Clyno outfits are conspicuous.

# CHANGE SPEED GEARS.

## A SELECTIVE CLUTCH GEAR.

**W**E have before us the working drawings of a new bottom bracket gear, the design of which is particularly sound, and which has already given excellent results on the road. This is to be marketed in a form which will fit almost any modern motor cycle, and will suit any Triumph machine made since 1906 without structural alteration.

The engine-shaft is fitted with two chain sprockets mounted on an extension of the shaft, and held thereon by means of a split spring washer and lock nuts, no keys being employed. A distance piece between the sprocket is chamfered out and drilled for lubrication, thus allowing for a certain amount of slip to absorb the harshness of the drive. The third sprocket shown is mounted on a free wheel and connected to a kick or handle starter as desired.

### Counter-shaft Mechanism.

The counter-shaft gear mechanism is mounted on a shell which is eccentrically bored, and passing through which is the main inner hollow-shaft. Through this hollow-shaft runs a push rod, which may be given a lateral motion by the movement of a double pedal to which it is connected by means of a pin working in a helical slot. At the end of the push rod remote from the pedal is carried a cross head mounted on two ball bearings, and to which are attached two thrust plates having inclined surfaces machined on them to correspond with

- A. Eccentric shell.
- B. Inner hollow shaft.
- C. Push rod with ball-races.
- D. Shell carrying main bearings.
- E. Expanding gunmetal drums.
- H. Outer case carrying push rod bearings and thrust plates.
- J. Socket carrying worm box.
- K. Worm box.
- L. Locking ring.
- N. Crosshead.
- O. Thrust nuts [sprocket.
- P. Kick or handle starting.
- U. Lubricating tube main bearing.
- V. Locking nuts.
- Z. Main driving sprocket screwed to shell D.
- CC. End cap with loose cover enclosing push rod mechanism.

Sectional sketch of the Rigby two-speed gear.

similar faces on the inside of the clutch drums. The main shell is carried on ball bearings and immediately outside it lie two phosphor bronze clutch drums. These drums are split in two places on their periphery, and when not expanded form bearings for a pair of large chain sprockets mounted upon them.

### Pedal Control.

A backward motion of the pedal, before mentioned, causes the thrust plates to expand the outer of the two clutch drums, and thus lock the high gear sprocket to the main shell, leaving the low gear sprocket free, and in a similar way a forward movement of the pedal engages the high gear. The final drive is by chain from a sprocket mounted on the main shell to the rear wheel. All the ball races are adjustable, the working parts are enclosed in a dustproof cover and a sensible chain cover is fitted to the forward chains. This gear is made on the selective clutch principle, which gives a direct drive on both the high and low speeds, the only additional friction being the idly running chain and sprocket wheel.

A feature of the gear is that the clutch drums are so designed as to give the maximum possible amount of gripping surface, this being the reason why they are split in two places instead of one as is usual. This gear is not an experiment, for it has been tested for some thousands of miles on two big twin-cylinder machines, in each case with a sidecar attached. The manufacturer of the gear is Mr. E. J. Rigby, Prescott Road, St. Helens, who should find a big future for it.

## THREE-SPEED COUNTER-SHAFT GEAR.

Three-speed counter-shaft gear fitted to a 3 1/2 h.p. New Comet-Precision.

The annexed illustration is of a new three-speed counter-shaft gear with clutch made by Mr. A. H. Haden, Princip Street, Birmingham, maker of the New Comet motor cycles. The chief point in this gear is its adaptability to a standard frame with 3 1/2 Precision engine, for which it has been specially designed. The total weight of the gear, with the controlling mechanism, is 23 lbs., and if the pedalling gear usually fitted be deducted the net additional weight is only 11 lbs.

## THE SIX DAYS' TRIALS.

### Slight Alterations to the Published Routes.

Mr. T. W. Loughborough informs us that several alternative portions will be included in the daily runs.

The homeward journey, after Lynmouth, on the second day (Tuesday), will probably be *via* Parracombe, Blackmoor Gate, South Molton, and Tiverton, to Exeter (Inch). Then either Sidford or Salcombe hills, Lyme Regis, Bridport, Beaminster, Crewkerne, Chard, and Combe St. Nicholas.

On the fifth day the hilly country around Wotton-under-Edge and Dursley will be traversed.

On the Saturday the alternative route will be followed Chard will be gained by the hilly road *via* Castle Neroche.

The second slow climb will be on Winyard's Gap, just beyond Crewkerne, on the Dorchester road.

### ANOTHER NEW CYCLECAR.

A new design four-wheeler which is being made by E. Gilyard & Co., Barkerend Road, Bradford. The power is supplied by an 8 h.p. Chater Lea engine, through ball-bearing gear box of the same make, and thence transmitted to the rear wheel by chains. The frame is made of steel tubing, and is sprung both fore and aft. The car is said to be particularly steady at high speeds, and as it is light (4 to 5 cwt.) it climbs the average hill with ease.

The Auto-Aero mudshield fitted to the front wheel of a 7 h.p. Indian. The arrangement of the centre panel allows air to pass but not mud.

#### Brooklands Successes.

At the B.A.R.C. meeting on the 15th ult., out of the twelve events, Pratt's Perfection motor spirit succeeded in securing six firsts and nine second places.

#### Trade Note.

Messrs. Mackenzie and Co., Bath Passage, Birmingham, who are makers of sidecar bodies of all kinds, will be pleased to forward illustrated particulars of their various patterns to manufacturers who are interested.

#### Sidecar Improvements.

The manufacturers of the Turner sidecar, J. H. Griffin and Co., Minorities Chambers, Minorities, Birmingham, have recently made some great improvements in the latest type, particulars of which they will be pleased to supply on application.

#### Instruction in Driving.

The London School of Motoring, Ltd., Tudor Place, 19a, Tottenham Court Road, W.C., is the first motor school of which we have heard where instruction is given in the art of driving a motor cycle. There is no doubt that the London School of Motoring will supply a long-felt want.

#### Delays in Delivery.

Readers who have Douglas machines on order will be interested to hear that the makers now expect to receive large deliveries of magnetos, which will enable them to send out numbers of machines which have been waiting for several weeks for these necessary adjuncts to the power unit.

## SPARKLETS

#### Trade Note.

Messrs. Herbert Terry and Sons, the well-known spring manufacturers, of Redditch, have started on an extension of their premises.

#### "Territorial Monthly."

No. 1 of *The Territorial Monthly* (2d.), the official organ of the Legion of Motor Cyclists, was published last week. It can be obtained through newsagents and bookstalls.

#### Tyre Repairs.

The Continental Tyre and Rubber Co., Thurloe Place, London, S.W., have a finely equipped repair works at Willesden, where is a staff of specialists in tyre repair and a plant specially laid down for this work only.

#### Addresses Wanted.

The number of people who send enquiries and repairs to various firms and omit to give addresses is astonishing. The North British Rubber Co. (Clincher tyres) have received a tube for repairs from Southwold (Suffolk), and a Mr. R. G. Setter, Camberwell, has sent an enquiry to the Leicester Rubber Co., both without sufficient address. If this attracts their notice will they communicate with the firms in question?

#### Petrol Consumption.

The Nubric Co., Spring Bank, Wigan, are selling locally a soluble powder which they have named Petropel. It is claimed for this that there is a saving of twenty per cent. on the petrol account. One experimentalist in the district asserts that he obtained ten minutes' extra running out of a gill of petrol in a test recently made with a fixed engine.

#### Change of Address.

Messrs. Pirelli, Ltd., have removed from 45, Basinghall Street, to 144, Queen Victoria Street, E.C.

#### Counter-shaft Two-speed Gear.

The G.H. is the name of a bottom bracket counter-shaft gear which embodies handle starting, chain transmission, and a friction clutch. It is being fitted to the  $3\frac{1}{2}$  h.p. Wulfruna motor cycle. This gear is specially adapted for sidecar work. The makers, the Wulfruna Engineering Co., Wolverhampton, also supply the gear separately if desired.

#### Catalogues Received.

The latest list of Rich detachable air tubes shows a considerable reduction in prices.

John Piggott, Ltd., 117, Cheapside, E.C., have just issued a new general list which includes all accessories and clothing for motor cyclists.

The latest price list of Michelin motor cycle tyres also gives particulars of the Michelin butt-ended inner tube and the various covers for which this firm is so highly reputed.

The Crown Mfg. Co., Small Heath, Birmingham, issue a catalogue entitled "What Every Motor Cyclist Should Know." The third edition is just to hand and contains illustrations and descriptions of this firm's Monarch tyres and Crown rubber belting. Geo. Brongh made use of one of these belts in the London-Edinburgh Run.

A well-illustrated leaflet of the Mead-Flyer is just to hand. This machine is marketed by the Mead Cycle Co., 11-13, Paradise Street, Liverpool, and is supplied in  $2\frac{1}{2}$  h.p.,  $3\frac{1}{2}$  h.p., and  $4\frac{1}{2}$  h.p. models with and without free engine hub.

All motor cyclists requiring spare parts or accessories will be well advised to get a copy of the very comprehensive catalogue issued by Messrs. Brown Bros., Ltd., Newman Street, Oxford Street, W. This catalogue contains practically everything that is likely to be required by motorists or motor cyclists.

A group of tourists in Germany. From left to right they are—H. Rossner ( $3\frac{1}{2}$  hp. Scott), R. Rude (6 h.p. N.S.U.), Mrs. C. H. Rossner ( $3\frac{1}{2}$  h.p. Scott), and C. H. Rossner (7 h.p. Indian). The machines are shod with Palmer and Kempshall tyres.

**95 GUINEAS, ready for the Road.****SATISFIED CUSTOMERS.**

20/3/12. "The Rollo is running extremely well—in fact, far better than I anticipated. She holds the road perfectly."

18/4/12. "I like the Rollo very much, and wish you every success."

29/4/12. "The machine is running very well, and attracts a good deal of attention."

8/5/12. "I have now done about 500 miles on the car, and am very pleased with it. The car easily does 35 m.p.h., although I have not tried it all out. It also climbs very well. Everybody I meet is much interested, and I should think you would have plenty of sales here."

17/5/12. "The car runs all day like a clock."

17/5/12. "I am still getting satisfaction out of my car. I hope you are getting plenty of orders."

AND MANY OTHERS.

**THE RELIABLE ROLLO.**  
The Premier 4-wheeled Cyclecar. Fast, Safe, and Simple.

**100 GUINEAS, with Windscreen and Hood.****SATISFIED CUSTOMERS.**

20/5/12. "I should like to tell you that my car is going beautifully at present. It has climbed Dashedwood Hill with 24 stone up, also three suit cases, spare tyres, oil, and petrol."

25/5/12. "I fully endorse the testimonials you have received. The little car is a marvel, and goes wonderfully."

31/5/12. "I should like you to know that I am delighted with my Rollo car. I can drive and control it perfectly and have indulged in scrapping with eminently satisfactory results. With two up and luggage I passed five cars which were all endeavouring to pass one another to avoid the dust, and have attained a speed of 47 m.p.h. I also left an 8h. — and sidecar on the road. This would have beaten me if it had not been for your variable gear. Please accept my best compliments."

AND MANY OTHERS.

Catalogues and full particulars from The ROLLO CAR Co., Ltd., Conybere St., Birmingham (Eng.)

## Two Useful Books for Motor Cyclists

### "MOTOR CYCLES AND HOW TO MANAGE THEM."

Fifteenth Edition now on sale.

This book has long been recognised as the standard handbook of the modern motor cycle.

Net 1/6, post free 1/2.

Obtainable from leading Booksellers and Railway Bookstalls, or direct, with remittance, from Iliffe and Sons Ltd., 20, Tudor St., London, E.C.

### "THE MOTOR CYCLE ROUTE BOOK."

First Edition now on sale.

Specially compiled for users of the highway in the United Kingdom. Route finding is made both instructive and entertaining. The book contains the maximum amount of information in the smallest possible space.

Net 1/6, post free 1/9.

**Economical. Puncture-proof.  
Light. Rigid. Good. Cheap.  
Detachable. Durable.**

Best English Chrome Leather, impervious to wet. Fitted with Steel Studs that will not pull out. Attached to tyre by means of clips which clinch the rim. You can fit it yourself.

# LOMAX

## "PATCHQUICK" TO THE RESCUE!

### THE WALLET.

CARRY YOUR OUTFIT IN THE  
"PATCHQUICK" WAY.

These Outfit Wallets, made specially to hold the world-renowned three shilling "Patchquick" Outfit, have created a furore in motor cycling circles. They are provided with strong attachment straps.

Price, complete with tyre levers, 3/- each; without tyre levers, 2/6 each. Outfits, 3/- extra.

"One of the most useful and novel accessories which have been brought to our notice."—*The Motor Cycle*.

Miss E. L. C. Watson, in her daring and strenuous ride through South Africa by motor cycle, proves the super-excellence of "Patchquicks." On one occasion her tyre was punctured by the Karoo thorn illustrated below (half size), but a sure and permanent repair was quickly made by the application of a "Patchquick" Patent Patch. "Patchquick" was true to name," says Miss Watson in "Motor Cycling." "Incidentally I found that this repair outfit is a favourite here."

A photograph of the actual Karoo thorn which punctured Miss Watson's tyre, half life size. (Reproduced by courtesy of "Motor Cycling.")

Illustrated Lists Post Free.

**WOODGATES BROTHERS,**  
Dept. F, TIVERTON ENGLAND.

### THE OUTFIT.

The celebrated No. 4 outfit, price 3/- each, known and appreciated from Equator to the Poles

This outfit is the most popular and efficient Repair Outfit on the market, tens of thousands being made and sold annually. It has broken all sale records the world over, proving itself as popular abroad as in the British Isles. Our long experience has resulted in the evolution of the perfect product.

"PATCHQUICK FIX" in tubes 6d. and 1/-; in screw top tins, 9d. Supplementary outfit 1/- ea

## Half-Time Puncture Repairs

—better and permanent, too—if you use a Parsons Rapid Repair Kit. instead of the old-fashioned, troublesome, patch-and-solution way. Isn't this a strong inducement why YOU—Mr. Motor Cyclist—should spend 15/- NOW on a PARSONS RAPID REPAIR KIT? No "waiting for patches to dry"; no uncertainty; no leaking; no mess—with the Parsons Way. You can be on the move again in a minute if you carry this little 7in. by 4in. Repair Kit. Get one To-day.

*See how  
it's done.*

E.H.G.

Anyone can pay  
cash for  
a motor cycle—  
but why  
should YOU?

Read it  
Again.

—when Pagets Plan enables you to purchase by monthly instalments—to enjoy the use of the machine whilst paying for it. Anything more easy or straightforward could not be imagined—just pay one-fifth down and the machine is yours. Send us the balance so much a month.

**Early Deliveries if Orders given now.**

*Write for full details of Pagets Plan.*

**PAGETS LIMITED.**

10 and 11, Jermyn Street, London, S.W.

**PAGETS  
PLAN**

E.H.G.

**1,459  
MILES  
IN A WEEK.**

The above remarkable record ride was accomplished by Mr. Arnold Butler, with a sidecar and passenger, on an "A.S.L." fitted with the

**U.H.  
MAGNETO.**

The U.H. Magneto is absolutely reliable, under all conditions. Extremely simple, having fewer working parts than any other.

# CORONET SIDE CARS

Are made in a factory equipped with special machinery for turning out high-class sidecars only. Our illustrated catalogue will be sent post free, showing clearly the many refinements and improvements only to be found in the "CORONET."

CAN BE OBTAINED FROM ALL DEALERS.

Model 1. High-class Canoe-front Body, Cranked Axle, and other improvements, £6 6 0.

Model 4. Ornamental Cane Body, as illustration, or Close Reed Cane Body, £8 8s.

CORONET DETACHABLE JOINTS enable our sidecars to be detached in one minute.

We illustrate herewith the "Coronet" Quick-detachable joints, which are fitted to all our models. To detach is simply a matter of unscrewing nut about five threads. When attached, and nut screwed tight, the joint is solid and perfectly rigid, and does not rattle like some patent joints held in position by springs and pins that are liable to shake loose.

## MAGNETOS. MAGNETOS. MAGNETOS.

We have a large stock of the best makes from 5/6. Your old coil and acc. taken in exchange.

### 25/- ALLOWED

for your B. & B. or Amac Carburetter if fitted with H.B. control in exchange for a new 1912 SENSAPRAY or BINKS.

TRIUMPH, 1911, standard, exceptional condition, unused through winter; bargain, £35, receipt given; no offers.—64, Tilton Rd., Small Heath, Birmingham. [X4640]

MOTO-REVE, 1911, 2 h.p. twin, Druids, new studded tyre, Dunlop and Whittle belts, horn, tools, spares; £19/10.—35, Weathercock Rd., Sparkhill, Birmingham. [X4814]

TRIUMPH, F.E., 1910, Cowey, 2 spare belts, lamp, generator, Lucas horn, many spares, just overhauled, condition perfect; £35, or nearest.—W. J. Collins, Earl Shilton, Warwick. [X4752]

1911 3 h.p. Humber, 2-speed, new condition, not done 2,000, Jones speedometer, head light, whistle, mirror, spare cover, belt, valves, etc., many refinements; £38.—Hirst, 214, North Fosse, Leicester. [1956]

1912 F.E. Triumph, done 2,000 miles only, complete with Cowey, Lucas lamp and generator, horn, watch, new Kennhall on back and all spares and tools; what offers?—Triumph, 28, Narborough Rd., Leicester. [X4926]

DOUGLAS, 1911, 2-speed, D, condition perfect, full set tools, pedals and extra footrests interchangeable, spares, belt and tube carrier; approval, deposit; £34, or offer.—Baynes, St. Anthony's Hill, Desborough, Market Harborough. [1722]

1912 Rudge, T.T., also F.E. Zenith, Singers, immediate delivery; 1911 F.E. Singer, just overhauled by makers, £39; two 1911 Triumphs, standards, condition excellent, not ridden since March, being taken in exchange; £37 each.—Midland Cycle Co., Coalville, Leicester. [X4896]

TRUMP Motors, Ltd., Birmingham.—1912 free engine Rudge-Whitworth, practically new, £50; 3-speed Sturmer-Archer 3 h.p. Trump-Jap, with sidecar, 1912, perfect condition, £56 complete.—Apply, Exchange Department, Trump Motors, Ltd., 36, John Bright St., Birmingham. [X4920]

TRIUMPH, 1910, just been thoroughly overhauled by makers, many 1912 improvements, including new carburetter, piston, engine pulley, handle-bars, belt, etc., perfect condition, Lucas lamp, many spares, not done 200 miles since overhaul; owner bought car; £35.—Holcroft Ingleside, Four Oaks, Warwickshire. [X4028]

## SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

1911 T.T. Rudge, in sound order, new tyres; £33.—Lambert, Thetford. [X4602]

1911 3 h.p. 2-speed Humber, in first-class condition everywhere; £37.—Lambert, Thetford. [X4603]

1911 Enfield Lightweight, cheap; 3 h.p. N.S.U., new 1911, £25.—Lambert, Thetford. [X4604]

FREE Engine B.S.A., free engine Ridges, 3-speed Premiers, lightweight Premiers, Bradbury, etc., in stock.—Lambert, Thetford. [X4605]

8 h.p. J.A.P., Chater-Lea, new April, cheap.—Lambert, Thetford. [X4672]

N.S.U., 3 h.p., 1908, Bosch, Brown and Barlow, good order; £16.—Fox, Whittlesea. [X4614]

INDIAN, 7 h.p., 1912 model, deliver at once; Ariel, 3 h.p., T.T. model, in stock.—Coward, Wisbech. [X4875]

N.S.U., 3 h.p., mag., B and B, new belt, good going order; bargain, £14, or nearest.—Lowe, Walpole, Wisbech. [X4037]

3 h.p. Minerva, new condition; cost over £20 Sept. 32 accept £14; bought higher power.—G. Seaman, Hunstanton. [1812]

MINERVA, 2 h.p., splendid running order, new belt fast; £25/10, or £1 and mag.—R. Matthews, 48 High St., Southwold. [1767]

1912 Zenith, 6 h.p., bargain, quite new, complete with 1912 Gloria sidecar costing £22/10, P.R.S. 23/1C lamp, 5 gn. Jones speedometer, 24 h.p. horn, spare belt and number other spares; 75 gns.—Robinson's, Greer St., Cambridge. [X4721]

DOUGLAS, 1910 pattern, tyres and engine as good as new; price £27.—Robinson's, Green St., Cambridge. [X4722]

GLORIA Sidecar, 1912, No. 4, nearly new, complete with travelling trunk; £15.—Robinson's, Green St., Cambridge. [X4722]

CLYNO, 5-6 h.p., 2-speed; sole agents in Eastern Counties; £68/5.—Robinson's, Green St., Cambridge. [X4724]

1912 Triumph, free engine model, actually in stock; price £55.—Robinson's, Green St., Cambridge. [X4725]

1912 Zenith, 5-6 h.p., very little used, complete with lamp, speedometer, horn, spare belt and other spares; genuine bargain, £57.—Robinson's, Green St., Cambridge. [X4726]

LADY'S Douglas, 1911 pattern, 2-speed, handle starting, ridden a few miles only, complete with lamp, horn, and spares; £38.—Robinson's, Green St., Cambridge. [X4727]

ROBINSON'S Motor Bicycle Garage, Green St., Cambridge, Triumph agents. Tel.: 588. "B.A." Bicycles, Cambridge. [X4728]

### Two-stroke Engines.

THE result of the Senior T.T. Race calls to mind the fact that a two-stroke engine has never previously won a classic motor race in this or any other country, and from now onwards the full limelight of publicity will be turned on this principle of constructing an internal combustion engine. Among the advantages of the two-stroke method, particularly in multi-cylinder form, is its even turning moment or continuity of torque. Doubtless many will ask why it does excel in this degree over the conventional type. The answer is that a working stroke takes place at each downward thrust of the piston, so that a single-cylinder is almost the equal of a twin, and the twin is equivalent to a four-cylinder.

Owing to the fact that the explosion and compression pressures balance one another, there is a continuous force exerted on the piston head which enables very light reciprocating parts to be used.

It should not be imagined, however, that because the working strokes are doubled that the power is multiplied to the same degree; this is because the cylinder of a two-stroke engine does not fill so completely as the four-stroke, and the explosions are thereby weakened. It is argued by some that on account of the increased number of working strokes the two-stroke engine should be handicapped in races, but this opinion is open to argument, particularly as races such as the T.T. are instituted to bring out the best features of individual types. The amount of power that can be obtained from a given cubical capacity irrespective of fuel consumption is the chief desideratum in motor cycle racing. For the commercial article expense in the way of increased

consumption can then be reduced by decreasing the size of the engine, thereby lightening the machine.

One of the disadvantages of the two-stroke principle is that the increased number of explosions induces greater heat, and it has not been found practicable to run these engines without the introduction of a complication in the way of water-cooling. On the score of simplicity and freedom from trouble water radiators, piping, and joints are a complication, as there is something more to go wrong, and water-cooling systems require extra attention in winter to prevent damage through frost. No one could accuse us of being unfairly critical if we point out that the winning of this year's T.T. by a two-stroke engine has hardly proved the great superiority in power which is claimed over a four-stroke of equal size, because, giving it all credit for its success, it should, on paper, have beaten the four-stroke by a greater margin than seven minutes.

What the two-stroke has demonstrated is its capability to win the most important event in the motor cycle world against all comers, and what would have been a more complete defeat of the four-stroke was only prevented by the tyre failure of the only other two-stroke machine in the race.

To sum up, the result of the T.T. proves that as regards power there is very little difference between the two systems. The consumption of the two-stroke is certainly greater, but it has the distinct advantage of superior torque, simplicity, and absence of vibration.

Finally, we take this opportunity of heartily congratulating the designer and makers on their success and for their perseverance in perfecting their system in face of such overwhelming odds.

## Combined Belt and Chain Transmission.

**W**HO emerged with most credit from the Junior T.T.? I modestly asked a group of enthusiasts in Douglas within a few hours of the close of the Junior event a week last Friday. The usual volley of "buts" and "ifs" were fired at me. "If" Bailey's gear hadn't stripped: "if" Newman's tyre hadn't burst: "if" W. H. Bashall had ridden the Humber he originally entered, and so forth. At the cease fire I gently insinuated—with my world-famous modesty—"It will always be called my race!" This lit the fuse. I was indignantly informed that I had merely sat on the best chair at Woodlands, cadged drinks, gorged chocolate, and so forth. When they had abused me sufficiently, I continued—still in Uriah Heep's rôle—"Who's been telling the trade and the public for two years past that the combined belt and chain drive is going to kill the straight-through belt, dead as a doornail?" An awkward silence followed: several innocents had not remembered the Douglas transmission in their meditations on the race.

### Equally Matched.

"Look here," I said importantly, "the Humber showed up best last year, the Douglas was easily top dog to-day. Put them side by side: they are the same weight, same power, same all-round class. Match them on a dry day at Brooklands, and the winner will depend on the luck of the race, pure and simple. On a dry day they are as nicely a matched pair as you could find in the world. But in the mud and the wet of Friday's

race the first half-lap put the direct drives down the list.

We have learnt—the world has learnt—that the combined belt and chain drive laughs at rain and mud and surface water. The chain drive has never conquered the British market: we all of us grumble about our belts when it is wet. The combined drive is going to be the popular drive of the nation within two years. It would have come anyhow. But that one wet lap has hustled forward two years: and now it's coming soon; you might almost say it's come.

In the very near future I predict that every type of machine—from 2½ to 8 h.p.—that's not wholly chain-driven is going to have the combined drive. And you'll all be wondering why you were such jugginses that you didn't see it before.

You'll get twice the distance out of your belts that you get now: you'll be able to go full tilt through a watersplash without your engine racing itself silly, and you'll climb Amulree in Scotch rain till your engines seize with never a sign of belt-slip.

Now I pretended to claim credit for myself when I opened fire, but I was only shamming, for it was the Douglas machine which taught me in 1910 that the combined drive was the solution of the transmission problem, and the credit's all theirs. I'm only one of

those fools who know a good thing when they see it.

I'm sure Douglas has done himself a bit of good: but I'm also sure he's done the whole industry good.

IXION.

THE  
MOTOR CYCLE  
IN  
THE ARMY.

1.—Motor Cyclist Scouts, attached to the Sherwood Rangers Yeomanry. 2.—Lightweight riders at Bubworth Park, Retford, Notts. 3.—Arthur H. Saxby, of the Royal East Kent Mounted Yeomanry. 4.—Trooper W. R. Guildford, L. W. Hudson, and H. S. Yearsley, of the West Kent Yeomanry. 5.—The motor cycle section of the Cambridge University Officers' Training Corps at Aldershot. 6.—Lieut. Cpl. Bagshaw (3½ h.p. Bradbury) and Trooper Bagley (3½ h.p. Humber) of the Northants. Imperial Yeomanry.

**W**HATEVER else may have been raught by the International Tourist Trophy Races of 1912, the events will go down in history as a decisive score for the twin-cylinder machine. For years these contests have been regarded as exciting and important tussles between single and twin-cylinder engines, quite apart from the actual T.T. victory, but this year for the first time could the races be regarded as real battles of the cylinders. All competitors in the Junior Race were allowed to use engines up to 350 cubic centimetres capacity, and in the Senior up to 500 c.c., irrespective of whether they were single or multi-cylinder, two-stroke, air, or water-cooled. This year's was the first race of its kind. Hitherto single-cylinders were obliged to concede advantages in engine capacity to multi-cylinders. Let us examine the results. In 1907 and 1908, when petrol consumption was taken into account, there was no limit to the size of the engine, yet the single-cylinder made better time in each case on a smaller consumption of spirit. In 1909, speed alone was the determining factor in the placing, the twins being half as big again as the singles. This time two twins beat the singles, and the result was reproduced a year later, when multi-cylinders were reduced to 670 c.c.

Last year the twins were still further reduced to 585 c.c., but again, notwithstanding their gradually restricted capacity, three got home before any single-cylinder. A twin also won the Junior Race.

In 1912 it was resolved to place all on an equal footing, and the twin has emerged triumphant in both events. It will also be seen that, notwithstanding smaller engines in the Senior Race, the speed has gone up in inverse proportion.

#### Successful Machines of Unconventional Design.

A couple of years ago the suggestion to race singles and twins on level terms would have been laughed at; this year they were almost equally matched, but the writer goes so far as to say that in two years' time the twin machine will have to give the single a start.

Turning now to the mechanical features of the winning machines, it is interesting to observe that

both the Douglas and the Scott can be termed of unconventional design, the one with a twin-cylinder opposed engine, the other with a side by side twin on the two-stroke principle. Another significant point which I have not seen emphasised by anyone as yet is that both had outside flywheels. Many an expert to-day regards the outside flywheel engine as the more efficient and satisfactory, and I verily believe that machines with outside flywheels steer better. Can it be due to the influence of the gyroscopic action in-

The twin-cylinder two-stroke engine of the winning T.T. Scott, showing the rotary distributor valve. The sides of the cylinders only are water cooled.

duced by larger flywheels? Likewise the counter-shaft method of transmission, embodying a change speed gear amidships, was a feature of both T.T. winners' machines, so that more knowledge is being gained with regard to the debatable point of light or heavy back wheel. One can hardly compare piston design, seeing that the engines are of different types; the Douglas had a drilled piston and used only one ring to each, whereas the Scott had three rings per piston. Haswell's Triumph, which finished second, had also but one ring on the drilled piston. In this connection it would be well if standard design could be insisted upon for pistons and cylinders. One ring on a loosely fitting piston in order to get high engine speeds would not suit for ordinary touring work. If revolutions can only be produced by loosely fitting parts, surely it points to something wrong with the design of piston and cylinder which causes unequal expansion. This is a matter which should be rectified.

## The Success of the Twin.—

## Speed and the Difference.

Haswell's ride on the first single-cylinder—a Triumph, as usual—was regarded as an extremely fine performance. The thousands who witnessed the race would know how much more difficult it was to sit the single-cylinder at mile a minute speeds compared to the smooth-running Scott. I overheard Applebee and Haswell discussing this subject in the measuring enclosure, and their remarks interested me greatly, as I had noticed the single bounce on the rough surfaces. By the way, has anyone realised that the Triumph Co. missed second place last year owing to their reticence in adopting the speed gear? Haswell's 1912 time was but 1m. 47s. slower than Godfrey's (585 c.c. Indian) last year. Although practically the same 85 × 88 mm. machines were used, we have the interesting fact that the Sturmey-Archer three-speed gear, of which only the two top ratios were used,

foremost it brought home the fact that small engine pulleys on lightweights are of little use for racing in wet, and the large driving pulley on a counter-shaft, geared up from the engine, is infinitely preferable, not only reducing wear and strain on the belt, but almost eliminating slip.

What a pity the competing machines were not weighed. It was doubly important this year seeing that engine dimensions were the same. I hope the A.C.U. will not overlook this another year.

## Transmission.

The *veraata questio* of chain or belt is no nearer solution except for the fine showing of the combined drive. The following statistics form interesting reading.

## JUNIOR T.T.

	Started.	Finished.	Percentage.
Belt ... ..	12	7	58.33
Chain and belt ... ..	6	4	66.67
Chain ... ..	2	0	—

A T.T. DUEL AT QUARTER BRIDGE.

At the beginning of the second lap the spectators were treated to a private duel between the winner, F. A. Applebee (Scott) and J. R. Alexander (Indian), both rounding the corner almost together. On the picking up stretch the two-stroke machine forged ahead.

improved the speed of the Triumphs over the 187½ miles course by no less than 18m. 52s. Carvill's time last year on a Triumph geared 4½ to 1 was 4h. 16m. 49s., whereas Haswell on the two-speeder (4 and 6 to 1 ratios) took only 3h. 57m. 57s. In comparing the times we must remember that, owing to the treacherous road surface on the morning of the race, rubber-studded Dunlop tyres were fitted to this year's Triumphs, which are not so fast as the plain tread wired-on covers which have been used hitherto.

## Would Rain have Affected the Result?

What would have happened if it had rained during the Senior Race? Some said chain-driven machines would have scored easily, others considered that the chains would have got clogged with mud and become harsh and stiff. In some respects it is a pity wet was not experienced as in the Junior Race, for the first two laps in that event taught us such a lot. First and

## SENIOR T.T.

	Started.	Finished.	Percentage
Belt ... ..	29	11	37.93
Chain and belt ... ..	2	2	100
Chain ... ..	8	7	87.5

## Change-speed Gears.

There were eleven survivors of the twenty starters in the Junior Race, and twenty out of forty in the Senior event. The following table shows the percentage of successes of the gears used:

## JUNIOR T.T.

Two-speed gears ...	7	4	57.14
Three-speed gears ...	11	6	54.55
Variable gears ...	1	1	100.00
Four-speed gears ...	1	0	—

## SENIOR T.T.

Two-speed gears ...	18	16	88.89
Three-speed gears ...	10	1	10.00
Variable gears ...	11	3	3.67
Single gear ...	1	0	—

## The Success of the Twin.—

## Single or Twin?

Another phase of the battle of the cylinders is provided by the figures below, giving the percentage of survivors on each type.

## JUNIOR T.T.

	Started.	Finished.	Percentage.
Twin-cylinders ...	14	8	57.14
Single-cylinders ...	6	3	50.00

## SENIOR T.T.

Twin-cylinders ...	17	11	64.71
Single-cylinders ...	23	9	39.13

The Senior figures will cause some astonishment, but it is only fair to mention that the small number of survivors on single-cylinder machines was no fault of the Triumph riders, seven out of eight of whom com-

pleted the course—by far the best team performance. The consistency of their running is worthy of special mention. Hoffmann averaged 44.46 m.p.h., Adamson and Kirk 44.29 m.p.h., Haswell (the fastest) averaged 47.28 m.p.h., and at the other end Hart-Davies 36.17 m.p.h.

With ordinary luck in the matter of tyres the Scotts might have been first and second, and as this is the first big event in which a two-stroke machine has emerged triumphantly, one must admire the foresight and perseverance of its designer, Mr. Alfred A. Scott. His was the first motor cycle to have a twin-cylinder two-stroke engine, a standardised open frame, a kick starter, and it was always marketed with chain drive and a two-speed gear. There never was a more original design. G.S.

ON THE SNAEFELL MOUNTAIN CLIMB.

J. A. Hoffmann (Triumph) rounding the corner on the Gooseneck, which is half a mile above the hairpin.

A. H. Alexander (3½ h.p. Indian) and H. A. Collier (3½ h.p. Matchless) negotiating the corner close together.

A view from below the Ramsey hairpin, showing S. L. Bailey (2½ Douglas).

## AN OFF DAY IN THE ISLE OF MAN.

ON the occasion of the one clear day which the writer was able to enjoy in the Isle of Man, an exceedingly pleasant time was spent on a 2½ h.p. Motosacoche, the small engine of which accredited itself admirably on the many stiff hills which abound there. The first part of the journey was northwards over the mountain road. Near Keppel Gate a little light pedalling was necessary, as the gradient is somewhat steep, but the little engine pulled well, and the long climb was finished in excellent style.

At the Bungalow, Captain Nicholl handed over to me the four-cylinder F.N., which had been placed at his disposal for the race week by the F.N. Agency, and a very excellent machine it is. Fitted with a most comfortable saddle and the finest pair of spring forks it is possible to imagine, to say nothing of the perfectly balanced engine, it was an absolute dream to ride. The charming smoothness and the glorious feeling of absolute comfort render it perfectly delightful.

It was driven three parts of the way to Ramsey, and in sight of the Albert view-tower was stopped, turned round, and restarted by pushing with the low gear in engagement (purposely). The engine fired at once, and was accelerated till the bevel screamed a song of joy,

then top gear was engaged, and the climb finished without a change down. It was an interesting and most enjoyable experience which the writer was very glad to have had.

The rest of the day included a climb up to Snaefell summit on foot, and, returning to the Motosacoche, a ride down the precipitous Sulby Glen Road, from which the journey was continued *via* Ballaugh, Kirk Michael, and Peel by the coast road. After Peel the road to Port Erin was taken, then Glen Meay, the hill beyond which has a corner possessing a very stiff single figure gradient, which appeared so suddenly that both the writer and his companion were forced to dismount. Thanks, however, to the Motosacoche pulley gear, an easy restart was made.

Then ensued a stiff climb over the hills, which the baby satisfactorily negotiated, and a long run down to pretty Port Erin. Our ride back to Douglas was without incident, save that we encountered a smashed up Matchless sidecar machine, which had struck a car end on and been reduced to an absolute wreck. It is a pity visitors do not use their machines with more care in the one place in the United Kingdom where the police act with the utmost lenience and consideration to visitors generally and motorists in particular. E.M.P.B.

# Occasional Comments

By "Izion"

## A Method of Carrying Spares.

Last week I was examining the machine of a chance roadside acquaintance, and I detected a most original method of storing sundry spares. A small piece of mahogany board about an inch thick was fastened horizontally between the rear ends of his carrier panel, and two spare valves and two plugs were mounted underneath it, in the usually wasted space between the carrier and the tail of the rear mudguard. Depressions were hollowed in the wood to accommodate the valve-heads, and the stem slipped through a central hole, the spring, cap, and cotter being affixed below to lock the valve. The sparking plugs were screwed up from beneath into holes of the correct thread. The rider said he had carried his spares in this fashion for two seasons with great satisfaction.

The next dodge I expect to see will be spring clips on each spoke on both sides of the rear wheel, into which two spare belts may be coiled and snicked!

## Steering Design.

Just at present I am inhaling my ozone on a T.T. Rudge, and it draws one's attention to the great variations one meets in steering forks. This machine is tuned for speed work, with very much advanced ignition, and a carburettor adjustment which will not allow it to fire regularly at much under legal limit, and it only gets into a nice even purr towards 35 m.p.h. or so, while it can beat a mile a minute if I give it permission. Yet except when the machine is all out, it can be safely and comfortably steered one-handed, and the springs in the fork roll out all uneven surfaces.

About as much could be said of an Indian I rode earlier in the year, and doubtless of other leading makes which I have not sampled recently. But I must say that there are plenty of machines which fall below this standard; machines with bounceable forks, which register the location of every shallow pot-hole on the joints of one's vertebrae, machines which can only be kept upright at low speeds by considerable address, and which invariably necessitate two wrists of steel if they are to be held on a beeline when the speedometer needle is half-way round its dial.

Now why don't the makers of these bad steerers examine the principles embodied in the few perfect steerings, and duplicate them?

## Fly-up Stands.

Having ridden many machines with stands which had to be kicked up and pressed into a spring holder, I found my puzzled toe wandering out rearwards to urge the stand into its clip, and with a pleased smile I realised that the L.M.C. stand flies up of its own accord. This is a very convenient and simple detail which might reasonably be copied with advantage. No one wants to handle a part of the machine which is always more or less dusty or muddy, according to circumstances.

## American Journalism.

I always enjoy reading the American motor cycle papers, though their ways are not ours. Of late their star reporters have been more lurid than usual. When the 95 m.p.h. track record was put up the other day one scribe remarked it was lucky they had electric timing, for you couldn't see the rider or his machine at all, so fast were they travelling; in fact, you could only tell when they passed you by two tokens—the draught and the noise.

If the American libel laws were in force over here we should be able to give much freer vent to our occasional resentment against the police. The current issue of a Chicago paper remarks of one Chief Constable, "He is reasoning with his feet, and they are cross-eyed!" And of another, "This is the man who fought two years for a six-cylinder automobile, urging that the superintendent and detectives could hurry faster to a scene of crime. He got the machine, but is seen oftener hurrying to a scene of conviviality than to a scene of crime." (How German motor cyclists must envy such rights of free criticism!)

The chief American cities keep a squad of motor cycling constables mounted on high-g geared 7 h.p. twins, and these scouts employ a provocative policy, if the press reports are truthful. Wearing no uniform, they coax some unsuspecting tourist to engage in a "scrap" with them, and when he has got his nose well down and his throttle open, they reveal their identity and arrest him. Motoring offences in most States render the culprit liable to instant arrest: he is immediately haled before the magistrate, and has to pay the fine before he is allowed to proceed.

JUNIOR T.T. RACE. Harold J. Cox (2½ h.p. Forward), the third to finish, at Hilberry corner. Cox was also third last year.

# ENGLISH-DUTCH TRIAL.

Programme of Events in connection with the International Trial on August 5th.

**A**RRANGEMENTS for the above international reliability trial to be held in Holland, on August Bank Holiday Monday, are proceeding apace. On this page we outline the programme of events, and the order in which the riders will be started in trios from Amsterdam at 8 a.m. By riding together the competitors will check one another, and no one will have an advantage in being acquainted with the course.

## Order of Starting.

H = Holland. E = England.

### TEAM I.—PRIVATE OWNERS.

- H 1. J. A. v. d. Garde, Class B (Rover).
- E 2. Geoffrey Smith, Class A (Humber).
- H 3. H. Dieters, Class C (Phanomobiël).

### TEAM II.—TRADE.

- E 4. W. W. Douglas, Class A (Douglas).
- H 5. Hugo Smit Ezn, Class B (N.S.U.).
- E 6. Frank Smith, Class C (Clyno).

### TEAM III.—PRIVATE OWNERS.

- H 7. E. J. E. Maas, Class B (F.N. 4-cyl.).
- E 8. C. M. Down, Class A (Royal Enfield).
- H 9. D. Croll, jun., Class C (Indian sc.).

### TEAM IV.—TRADE.

- E 10. R. Holloway, Class A (Premier).
- H 11. P. J. Adrian and Co., Class B (Eysink).
- E 12. F. W. Barnes, Class C (Zenith).

### TEAM V.—PRIVATE OWNERS.

- H 13. P. N. Jelsma, Class A (Eysink).
- E 14. W. O. Oldman, Class C (Bat).
- H 15. D. de Roon, Class B (F.N. 4-cyl.), first reserve.

### TEAM VI.—TRADE.

- E 16. Sam Wright, Class A (Humber).
- H 17. R. S. Stokvis and Znen, Class B (Rover).
- E 18. F. A. Applebee, Class C (Scott).

### TEAM VII.—TRADE.

- H 19. J. Fonck, Class A (Vulkaan).
- E 20. W. F. Newsome, Class B (Triumph).
- H 21. J. L. Geidt, Class C (Cyclonette).

### TEAM VIII.—PRIVATE OWNERS.

- E 22. V. Taylor, Class B (Rudge).
- H 23. G. Th. Arends, Class A (Vulkaan).
- E 24. W. Cooper, Class C (Bradbury).

### TEAM IX.—TRADE.

- H 25. D. v. d. Mark, Class A (F.N. 1-cyl.).
- E 26. W. Pratt, Class B (P. and M.).
- H 27. J. W. Boots, Class C (Coronamobiël).

### TEAM X.—PRIVATE OWNERS.

- E 28. F. Dover, Class B (Premier).
- H 29. J. H. Nieuwenhuys, Class A (Douglas).
- E 30. C. W. Wilson, Class C (Morgan Runabout).

### TEAM XI.—TRADE.

- H 31. N. V. v/h D. H. Eysink, Class A (Eysink).
- E 32. J. H. Slaughter, Class B (—).
- H 33. C. Witteveen, jun., Class C (James).

### TEAM XII.—PRIVATE OWNERS.

- E 34. F. A. Hardy, Class A (Norton).
- H 35. H. Daalmeyer, Class C (Cyclonette).
- E 36. E. Lester, Class B (P. and M.).

The time and general meeting place at Harwich will be announced later.

The list of rules are in the press, also the route cards, and copies will be issued to the team members together with the circular number plates which are similar to those used in the Tourist Trophy races, but smaller. Accommodation has been reserved for the English teams at the Hare Hotel, Amsterdam, which is close to the official garage.

As regards the transport of competitors and their machines, Mr. H. Maroney, of the Royal Automobile Club Touring Department, is obtaining special quotations from the Great Eastern Railway, and this information will be divulged as soon as all arrangements are complete.

It is hoped to make up a London and a Midland party of competitors. All must report themselves at the Parkstone

Quay, Harwich, not later than 6 p.m. Saturday, August 3rd. The boat leaves at 10 p.m.

## Special Awards.

Offers of special prizes in connection with this event have reached us. In addition to the silver challenge cup, called "D'e N.M.V. Beker," presented by Messrs J. Ferwerda and A. Citroen for international competition, Messrs. Phelon and Moore, Ltd., offer a silver cup for the best performance by a Dutch private owner.

The Motor Cycle Manufacturers' Union offers a ten guinea cup for the best performance by an English private owner.

The Motor Cycle offers a silver cup for the best performance by a trade rider, whether English or Dutch.

## Non-competitors.

We have been asked by a number of readers who desire to journey to Holland with the teams if they may compete. Having queried the secretary of the Dutch Motor Cycle Club on the matter, the answer is that no further entries can be accepted. Only those motor cyclists who entered for the International event in the first instance and were subsequently chosen as reserves will be checked in addition to the International teams, and silver medals will be awarded to all such competitors who complete the 160 miles course to schedule time, and bronze medals if not more than thirty minutes late.

## Programme of the Trip.

### SUNDAY, AUGUST 4TH.

- 5.15 a.m.—Arrival of the English competitors at the Hook.
- 7 a.m.—Breakfast in Hotel Aerika, Hook of Holland.
- 8 a.m.—Start for the Hague, where machines can be stored gratis in the garage of the Haagsche Automobiël My.
- 11 a.m.—Start for Scheveningen. Lunch at 12.
- 3 p.m.—Official reception and tea offered by the president of the N.M.V.
- 4 p.m.—Start for Amsterdam, *via* den Deyl and Haarlem.
- 6 to 6.30 p.m.—Examination of machines in the official garage at Amsterdam.
- 7.30 p.m.—Official dinner in Amsterdam, presented by the N.M.V. to the thirty-six internationals, representatives of *The Motor Cycle*, the A.N.W.B. Dutch Touring Club, the Dutch Automobile Club and the press. Evening dress.

### MONDAY, AUGUST 5TH.

- 7 a.m.—Competitors assemble in front of the National Gallery with machines ready for start.
- 7.30 a.m.—Ride to the start, a few miles out of Amsterdam.
- 8 a.m.—Start of the trial. Mr. Citroen will act as official starter during the whole trial.
- 7 p.m.—End of the trial at the official garage, viz., Darracq Palace, 100 Stadhouderskade, in the neighbourhood of the National Gallery. The last rider is due at 6.56 p.m., plus 30 minutes—7.26 p.m.

### TUESDAY, AUGUST 6TH.

Visit by boat to Volendam, where the A.E.W.B. Touring Club of Holland offers an official lunch to the thirty-six competitors, the representatives of *The Motor Cycle*, and the N.M.V. The boat trip will cost about 3s. 4d. After lunch by the same boat to Marken, a most celebrated fishing town, and by boat back to Amsterdam.

At 9 p.m. visit to Theatre Cinema Pathe, Kalverstraat, No. 122, Amsterdam, where the N.M.V. will show a moving picture of the arrival of the British teams at the Hook of Holland, the visit to the Hague, Scheveningen, etc.

### WEDNESDAY, AUGUST 7TH

The English competitors return home. The same route as Sunday, *via* Haarlem, Lisse, etc., will be followed to Ouden Deyl, thirty-five miles from Amsterdam, where lunch will be taken. Afterwards to the Hague for dinner, and then to the Hook of Holland, where the boat leaves at 11.50 p.m. A long time will be required to empty the petrol tanks and to get the machines on the steamer.

## SPECIAL NOTE.

The official dinner, the official lunch, and the tea at the Grebbe (on Monday) are free of cost *only* for the thirty-six international competitors.

## T.T. TRIFLES.

E. V. Pratt wore a belt consisting of tiny leather pouches, each containing a spare part.

If the rain had continued throughout the Junior Race, it is doubtful whether a single direct belt drive could have finished.

Harrison Watson pulled up at Ramsey on the first round, and drily remarked that though his *machine* hadn't completed *one* lap, his *engine* had done at least *three*.

Some of the Senior entrants meditated deeply on the merits of the belt-cum-chain drive during Friday's *débâcle*.

Hulbert was riding an experimental chain-cum-belt two-speed Triumph last winter, and found the belt gripped even in deep snow.

If you asked any non-finisher what had happened to him, he invariably said "tyres!" But there are other things which *can* go wrong.

In the Junior Race the wind was blowing at 20 m.p.h. against the riders over the mountain top.

The Triumph men were praying for similar weather on Monday, believing they had the best "wind-sloggers" in the entry.

In the Senior Race, S. L. Bailey, on the Colmore-Douglas, broke Friday's Junior record lap on three occasions. But for a spill at the Ramsey hairpin and a broken chain he would have been well up. Fifteenth place is something to be proud of. There were more Senior machines behind him than in front of him.

Seven Triumph riders out of eight completed the course—a typical result in connection with this make of mount in T.T. races. The absentee retired owing to a burst cover in the last lap.

A. H. Alexander ran badly for two laps, his carburettor catching fire owing to flooding and his inlet valve rocker sticking. At last his Indian metaphorically got the bit between its teeth and he completed three fast laps.

Harry Reed's performance is typical of the pluck displayed by many of the unfortunate in their desire to complete the course. The valve lifter pin broke, and dashing down the mountain at over a mile a minute, he raised the lever at Kepple Gate corner only to find it inoperative. He made direct for the wall and was only saved by the turf at the roadside. He had six more spills at corners owing to the failure of this pin.

We regret to have to announce that there has been again too much fast driving in the Island, and one bad accident occurred on the eve of the Senior Race, while the police had to complain of inconsiderate driving on the Douglas promenade. The A.C.U. looks after the competitors well, but it cannot control visitors, and it is a shame that those to whom a most hearty welcome is extended should abuse the exceedingly lenient treatment accorded to them. The police have been advised to take the matter into their own hands.

The Triumph riders experimented with concave-topped pistons; as these got hot, there was a tendency for the piston head to flatten out and seize.

The private road at Ramsey ought to be repaired at all costs before another race is held. There were at least twenty narrow escapes of falls due to taking the footpath at high speeds, and any such fall might easily cause the victim to be impaled on the iron fence. Moreover, the path is only 4ft. wide, and more than once a man left the depot a few yards down the road just as another rider tore up. This compelled the second man to take the high-road, and if his pace was estimated for the path, the bumps in the road caused a fearful quadruple wobble.

All the small parts of Applebee's Scott were additionally secured with insulating tape and glue.

"Wait and see what Indians can do next year, if there is no trade bonds!" Wells said curtly after the race, "I sign no more bonds!"

Haswell has a splendid phrase for the sound of a well-tuned engine; he says, "*it's revving nicely*."

On Tuesday morning Jack Woodhouse's machine was still lying in the ditch near Snaefell Summit, bearing obvious signs of its fall.

The noise of some of the Junior engines minus silencers was simply appalling. The continuous crackle of some of the fast-running twins would put a 60 h.p. Brooklands racing car in the shade.

The Colliers were as careful as ever. They never hustled their refills, but always had a rag waiting, and mopped off any spilt petrol before proceeding. Harry was overheard to say on the boat, "I'm getting too old for this game."

Godfrey, last year's winner, made of steel and rubber though he is, confesses to feeling very fidgety for an hour before the start of his races; but once he's off, he does not care a washer if it snows.

J. R. Haswell, curiously enough, was the only Triumph rider to utilise an old engine, and though it had a domed piston, it was well "run in." Though he was rather "jumpy" the night before (like many of the riders), he rode like a demon when he once started. In fact he was slowed because he began hitting the ground with his foot-rests at corners, a trouble he had never encountered in practice.

There is a lot of false signalling to competitors in T.T. races. The exact signals given by the trainers depend on different riders' mentality. In 1911 Wells kept signalling "second" to Godfrey, when he was actually leading, desiring him to travel faster, and make assurance doubly sure, while trusting him not to lose his head; but Godfrey's friends along the course kept yelling his real place to him.

Besides the Hairpin and the Gooseneck, there are three other corners on the mountain climb which call for much address. On the drop off the mountain there are two unnamed corners which need careful negotiation at speed.

Noise is not speed. Spectators had several proofs of this during the Senior T.T. A noisy machine would come along and impress the onlookers with its fleetness, but it needed a buzzing Scott to pass these machines to gain an idea of the pace they were travelling.

This year Applebee senior signalled "first" to his brilliant son; but Frank rode as though somebody was a minute ahead of him, and took all possible risks right up to the finish, sustaining three frightful swerves in his final passage through Ramsey.

Egg-flip and hot Bovril were the racing men's favourite refreshers; tea, beer, and whisky cause indigestion, and chocolate induces thirst. Most of the men go through fasting, as they find any food dangerous when they are jolting about with a full stomach.

The Triumph riders were much happier than last year's team in being provided with change speed gears. This year they all changed down at every bad corner.

Some of the men who were unaccustomed to variable gears did not use their low ratios half enough. Three times we saw two riders fighting desperate and even duels on rising ground; in each case the man who changed down got clean away. None of the Seniors got away from a bad corner better than the Douglas machines, and we estimate that the Douglas men only lost time up and down the mountain; they seemed as fast as anybody on the winding levels.

# Mechanical Features of T.T. Machines.

Direct-acting heel brake on the Dot machines.

Heel brake on the N.U.T.-Jap.

Foot-operated oil pump on the T.T. Triumphs.

The Triumph semi-automatic carburetter used on some of the T.T. machines. The jet is more exposed than on the standard model. The extra air can be adjusted by a slide at the top of the rearmost barrel.

The long extra air inlet pipe and forced feed from the crank case fitted to the Amac on H. C. Newman's Ivy-Precision.

Forced feed from the exhaust pipe on a 2 1/2 h.p. Humber.

Enlarged gauze covered air intake on the Amac carburetter fitted to Collier's Matchless.

Cylinder of the latest Green water cooled engine, showing pannier radiators and overhead inlet and exhaust valves.

Oil tank on the top tube of the water-cooled Blumfields, showing Best and Lloyd and auxiliary oil pumps.

Forward cylinder head and air-cooled exhaust lead

Humber engine pulley belt guard.

Blumfield overhead valve mechanism.

Cylinder of new 2 1/2 h.p. Precision. The exhaust valve is larger than the inlet.

## A Week in the Isle of Man.

By B. H. DAVIES.

**F**OR the benefit of future visitors I will commence by offering a few wrinkles about visiting the island in comfort. A machine is essential to an enjoyable visit, and it should be preferably a light-weight, for ease of handling on the steamer. Luggage is a nuisance, as a motor cycle and overalls lumber a visitor up considerably; my tip is to send the kit by parcel post in a couple of large parcels. Indifferent sailors should arrange to leave Liverpool at 10.30 a.m., when a three-hour turbine steamer can be relied on; on the return journey you can pick your boat and your sea, and if you are cutting things fine to catch a train at Liverpool, just label your machine at Douglas and hand it over to the Steam Packet Co.; they will take it home for you without any bother at all.

Finally, eschew hotels, which are crowded and noisy in race week; the island abounds with good boarding houses, where the food is excellent and terms are reasonable. It is much pleasanter to stay with a few chosen friends at one of these establishments than to put up at an hotel.

### The Direct Belt Drive.

The 1911 races once for all established variable gears in popular favour, thus confounding the cynics who pretend that racing is valueless for the public. I have great hopes that the 1912 Junior Race will utterly condemn the direct belt drive; if rain had fallen steadily during the Senior Race, this much-to-be-desired result would have been inevitable, for probably the Scott, Indian, and Douglas machines would have had the finish to themselves. I nearly got lynched in Ramsey on the Sunday night for remarking to a belt-loving team that I hoped it would pour with rain all night, but really the Junior Race had amply confirmed the touring experiences of every all-weather roadman. There was so much surface water lying on the roads that I saw three or four machines absolutely refusing to propel themselves on the flat with brand new belts of 1in. section as taut as bow-strings on pulleys of 4, 4½, and 5in. diameter.

Some critics may opine that other troubles were concerned, seeing that these belt-driven machines did not pull up rapidly in the succeeding laps of the Junior Race when the roads were drying. A little reflection will solve the puzzle. Belt-slip was continuous on lap 1 with every direct belt-driven machine, though the degree of slip varied—some only had to throttle after a particularly deep pool, others were perpetually dismounting, and one rider told me his engine had done a total of r.p.m. equivalent to three laps in twenty-five miles.

### Lubrication and Belt Slipping.

To counteract extra revolutions, some riders omitted to increase their oiling, so that their engines seized; others increased their oiling, but were unable to gauge the excess accurately, so that their pulleys sooted up, and

their cylinders carbonised, and their valves fouled. That evening I saw a famous works manager kicking himself round and round a bandstand, crying, "Why didn't I fit combined drive?" When the weather continued showery and lowering on Saturday and Sunday, the faces of the belt-loving entrants for the Senior grew longer and longer.

On Saturday I paid a visit to Sulby Glen—a notorious hill-climb which I should imagine is worse than any hill in the Scottish Trials, and is certainly far stiffer than any ascent in last year's Harrogate Trials. Excessive gradient is practically continuous, the surface is non-existent, and the hairpin bends are as narrow as they are acute. My T.T. Rudge-Multi negotiated the gradients very comfortably indeed, but owing to my being an indifferent cornerman the hairpins gave it all it could do, and I might not have got up if the belt had not been on the slack side. This is where the Rudge-Multi scores on a tricky or wet hill; you can get a little belt-slip where you need it on a stiff corner, and expanding the pulley stops the slip when you want to pick up again.

### A Question of Steering Design.

In company with sundry riders I enjoyed a few scraps over the mountain road, and here I encountered another point in which the races are bound to benefit the private user. Dropping down off Snaefell summit at 60-70 m.p.h. is a lurid test of steering.

In past years makers have thrown the whole onus of this test on the rider; if he swayed or cut out down the straights, or rocketed a trifle at the corners, the directors who were watching shifted their cigars to the far corner of their mouths and said, "Tomkins has a lot to learn."

This year the trade big-wigs were forced to notice that the men were not wholly to be blamed or credited. Certain frames and certain fork designs stood out head and shoulders above all others, both in straight steering at speed over ruts and potholes, and in convincing cornerwork. I think sundry inferior frames and forks are tolerably certain to be altered in the near future, as the direct result of this year's Manx experience in particular. More than one machine disfigured by a fork which is quite unworthy of it will be sternly taken in hand.

On Monday the start was distinctly tremulous. Thanks to the reduced capacity of the twins, the increased reliability of the Scotts, and the fact that the Triumphs had at last bowed to public demand and accepted variable gears, the race was felt to be extremely open. The Colliers had not shown sensational speeds in practice, and the two famous brothers are not growing younger; outright victory for them was deemed improbable, and as events proved, they could not have won even if they had escaped a few trivial bothers with their overhead valve gear. At the

**A Week in the Isle of Man.—**

same time, the Indian entry was not quite so formidable as in 1911; Godfrey and poor Moorhouse were out of the way, and owing to the trade bond we were not up against the opposition of the Hendee factory.

**A Prophecy for 1913.**

The 1911 Indian machines had been merely relieved of their vaseline coating, and fitted with new connecting rods, flywheels, and cams in London. No very exhaustive experiments had been performed to decide if all the minutiae of design required by a shortened stroke were the absolute best, and nobody was much surprised when the opening laps promised a British victory. I venture to prophesy that if the T.T. be held next year, and trade affairs permit the Hendee factory to enter heart and soul into the event, the Indians will once more have to be dreaded and beaten.

The race showed plainly in what a very casual spirit many entrants undertake their task. I should say that quite half the users of three-speed hubs were ignorant how to adjust their control, the rod of which was liable to get bent in falls, or even by frenzied knee-gripping at anxious moments. More than half the competitors had omitted to make any detailed study of the course. The cracks knew where the bad ruts were, and had studied a definite line at the worst corners, to which they adhered closely every time they came round, while the ruck simply 'drove' as fast as they dared, and bounded haphazard all over the road; one or two men, who finished the course, took the same corner in five different ways. Engine troubles seemed over-numerous; I think this was due to the trade bond, which prevented complete preliminary tests at Brooklands. If the trade as a

whole formally compete next year, we shall not hear of riders seizing their experimental engines every single morning in practice, and finally starting in the race with an untried piston-cylinder combination.

**Technical Lessons of the Race.**

Summing up the technical lessons, I should say that in 1913, supposing the races continue, we shall see the combined drive on many machines, we shall see a crop of new forks, and possibly of new frames designed to hug rough roads more evenly, and we shall see gears which place the additional weight nearer the centre of the wheelbase.

The question will also arise whether the two-stroke engines ought to be handicapped in cylinder capacity. If a team of six Scotts were entered under existing conditions, one could hardly look elsewhere for the winner. By the way, both races were won by machines of absolutely unconventional design, which have had to fight their way on to the market, a fact full of comfort and encouragement to original designers.

This year the trade bond threw a specially heavy strain on the riders. One has to train as hard for a motor cycle race of 187 miles as for a boat race or other athletic feat, and the early rising for morning practice during the preceding week always renders training difficult.

On the return journey we had a better boat than usual, and a calm passage; but the time occupied in disgorging two or three motor cycles from the bowels of the steamer at Liverpool emphasised the wisdom of sending machines home as unaccompanied freight; and another year the A.C.U. would do well to arrange for supplies of petrol at the Liverpool as well as the Douglas landing stage.

**PROMINENT TOURIST TROPHY RIDERS.**

David C. Belton (3½ h.p. Rudge-Multi), who occupied sixth place on the fourth lap but retired with a broken valve.

The unlucky No. 13—by special desire. S. F. Garrett (3½ h.p. water-cooled Regal-Green-Precision). He was the thirteenth to finish.

A. H. Alexander, mounted on the 3½ h.p. Indian ridden to victory by O. C. Godfrey last year. The young Scotchman was delayed by carburetter troubles.

# My Most exciting Ride: No 6. CHARLES COLLIER.

Interrogated by LC.

CHARLIE COLLIER did not take long to fix upon his most exciting ride, for one race of his stood out from all others on the score of excitement, and he at once brought to mind the races of 1906 between himself and George Barnes, otherwise known as "Cannon Ball" Barnes. Barnes had expressed his confidence of beating any motor cyclist in the world at a purely speed contest, and he challenged whosoever cared to meet him in *The Motor Cycle*. Charlie, to whom Barnes especially directed the challenge, took up the gauntlet, and an hour race was therefore soon arranged between him and Barnes. Charlie rode the same 6 h.p.

Matchless twin which had just been built for the international race of that year, while his opponent had an 8 h.p. Buchet. There had been a deal of controversy as to the respective capabilities of the two riders, but Collier easily won the event. Not to be thus easily accounted for, Barnes offered to meet Collier in short distance races, and a series of three, over distances of one mile, three miles, and five miles respectively, was arranged for decision at Canning Town.

"In the first event, over a mile," said Collier, in relating his experiences. "I got away at the start and finished first, but the second race—distance three miles—was the most exciting ride I have ever had. I knew it was a case of the man who first got going properly winning, and to my horror I saw Barnes getting off the mark first. Before he had fully accelerated though, I was passing him, and I settled down to the ride. I have never travelled at such a dangerous speed before or since, and even now I look back and marvel at the wonderful time I made. The second mile was covered in  $57\frac{4}{5}$ s.,

so that I was doing over a mile a minute on that little track. I hardly realised the danger I was running, so anxious was I to win, and I sped round as fast as my machine would take me, keeping as near the edge as I could. I had little fear that Barnes would overtake me, for it was impossible to do so at that speed on the Canning Town track, but I could not dream of slowing down, and so I went on, apprehensively, but with my blood up. It was over in a little more than three minutes, and the rubber decided, for I had secured the first two events. That second mile will never be beaten on that track, for in the condition it is now such a speed would be impossible, and even then it was stupendous."

"How did you feel when it was over?" I said.

"Feel! Why, I just thanked my lucky stars that it was finished, and,

after cooling down, I realised that I had won and began to forget that I was feeling dazed. In the third race I let Barnes have matters all his own way, for I could not ride any more that day, and after doing a short distance I stopped, and Barnes finished alone. I have never been so keen about any-

thing as I was to beat Barnes then, and possibly my anxiety contributed to the excitement I felt; in any case, I have never been so thrilled before or since, and do not wish to be, either. Following on the match, I took the same machine away to compete in the eliminating trials for the International Cup, and won."

"Were you not excited over the match with De Rosier last year?" I queried.

"No," said Collier. "Brooklands is not Canning Town." I agreed with him, and marvelled at that sixty miles an hour sprint over the little track in the East of London.

## NEXT SATURDAY'S BROOKLANDS MEETING.

The following are the entries for the Tenth Short Handicap ( $5\frac{3}{4}$  miles) at Saturday's B.A.R.C. meeting:

A. E. Pontin (1-cyl. Rudge) ...	85	× 88mm.
Scott Aitken (1-cyl. Rudge) ...	85	× 88
L. Straker (1-cyl. Jap) ...	85	× 85
H. H. Square (1-cyl. Robin-Minerva) ...	69	× 69
K. Yano (2-cyl. Bat) ...	85	× 58
S. Day-Timson (1-cyl. Rudge) ...	85	× 88
P. Newbold (2-cyl. Zenith) ...	76	× 85
James Gibbs (2-cyl. Humber) ...	60	× 60
Basil Collier (1-cyl. Rudge) ...	85	× 88
A. G. Walker (1-cyl. Rudge) ...	85	× 88
J. A. Manners-Smith (1-cyl. Triumph) ...	85	× 88

H. Jepson (1-cyl. Zenith) ...	85½	× 85
J. Cocker (1-cyl. Singer) ...	69	× 80
G. E. Stanley (1-cyl. Singer) ...	69	× 80
P. Schmidt (1-cyl. Puch) ...	76	× 77
H. Martin (1-cyl. Martin) ...	76	× 59
H. Belcher (A. G. Fenn) (2-cyl. Humber) ...	60	× 60
B. C. Remington (1-cyl. Rudge) ...	85	× 88
F. H. Hannis (1-cyl. Jap) ...	77½	× 90
R. L. Printz (2-cyl. Bat) ...	85½	× 65
E. B. Ware (2-cyl. Zenith) ...	76	× 55½
D. R. O'Donovan (1-cyl. Singer) ...	69	× 80
C. Pressland (1-cyl. Rudge) ...	85	× 88
L. L'E. Edwards (1-cyl. Rudge) ...	85	× 88
E. Remington (2-cyl. Jap) ...	90	× 77

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

### Jake de Rosier.

Sir,—Regarding your paragraph headed "Jake de Rosier," may I say that I am much surprised after hearing of the enormous sums that he was making in America to find that he is so much on the rocks. Whilst being quite willing to add my mite to any scheme that may be brought forward for his benefit, I should certainly like to know if what we were given to understand was true, or were they simply "running us up the garden."

INTERESTED.

### Tyre Makers and the A.C.U. Six Days' Trial.

Sir,—The policy of the members of the tyre section of the Manufacturers' Union in deciding not to enter their tyres in the above trial will surely give an opportunity for makers outside the Union to demonstrate the worth of their products. I, for one, will not patronise any firm who is satisfied to rely on the unfortunate user to test his goods and refuses to bear any expense in the matter. It will be interesting to see which makers have sufficient confidence in their tyres being able to withstand the trial to come forward and reap the benefit which is certain to reward their enterprise.

NON-UNIONIST.

### Road Conditions between Kew and Richmond.

Sir,—I have been interested in the correspondence which has appeared in *The Motor Cycle* regarding the abominable condition of the Kew Road, and can fully endorse all that has been said, but I think your correspondents cannot have been in the neighbourhood for some time, or they would have found things in a state which will rejoice the hearts of all motor cyclists who are compelled to travel from Kew to Richmond. The authorities appear to have suddenly leapt into action and are now busily engaged removing the ancient tramlines and laying the foundation for a new road of wood blocks. The operations are expected to last from four to six months, and in the meantime traffic is being diverted by the route indicated by Mr. Little.

Referring to the comments of "Ixion" in your issue of a few weeks ago regarding the weakness of the component parts of three-speed hubs, my experience strongly confirms his remarks. I had only ridden about 700 miles on my own three-speed geared machine, when I was one day held up by slipping clutches. On dismantling the back hub, I found that the ring nut, which keeps the discs against the spring plate and was only about  $\frac{3}{16}$  in. thick, had stripped its four threads. Surely a part having a strain to stand like this should have been made of stouter material to give some factor of safety.

P. WILLIAMSON.

### Power Required for Sidecar Work.

Sir,—I hope you will kindly grant me space to reply to Mr. R. H. Adams. If he will read my letter again he will, I am sure, admit that he has not answered one single point raised by me. I certainly did not condemn wholesale the  $3\frac{1}{2}$  h.p. for sidecar work. I said that for serious sidecar work a 6 or 8 h.p. twin was required, but that a  $3\frac{1}{2}$  h.p. would do well enough for occasional sidecar work on good roads. This I most emphatically repeat. My remarks as to examining engines (not cylinders) were distinctly stated to refer to single-gear sidecar enthusiasts.

By serious sidecar work I mean being on the road practically every day in all weathers over good and bad roads. Anyone who knows County Donegal in the winter will know what that means—ploughing through mud and stones, up steep hills, and against heavy gales and rainstorms.

I agree with Mr. Adams that I was unkind to my  $3\frac{1}{2}$  h.p. machine, though not in the way he means. I got the machine in October and rode it until the end of the year through the most frightful weather with sidecar and passenger for 3,500 miles, and up to 2,500 experienced very little trouble; but after that the engine began to give up, the principal trouble being with the crankpin rivets, which were constantly shearing off. Let me say at once that I do not consider it any discredit to the machine that these troubles should have occurred—it was being called upon to do work for which it never was intended, being constantly driven with the throttle wide open, and I may mention here that it was the constant letters appearing in your paper from those whom I may call the "thousand mile brigade" which induced me to invest in my  $3\frac{1}{2}$  h.p. combination—the impression left on my mind by these letters being that a  $3\frac{1}{2}$  h.p. had any amount of power to spare when pulling a sidecar. I am fully aware of the capabilities of a thoroughly tuned specially selected  $3\frac{1}{2}$  h.p. engine in the hands of an expert. Anyone who saw the wonderful ascent of Glengesh Hill by Hugh Gibson with Bradbury and sidecar and passenger in the Dublin and District M.C.C. 24 hours' trial, could not fail to have been greatly impressed. He made an almost clean ascent, running alongside for about twenty yards when almost at the top—a most meritorious performance when one considers that out of thirteen machines which arrived at the hill only three made clean ascents, amongst those that failed being a big 7-9 h.p. twin two-speed ridden solo. But, unfortunately, we are not all Hugh Gibsons, and therefore I say to sidecarists, have a sufficient reserve of power to allow for an unexpected hill with hairpin bends, a gale of wind, and an engine slightly out of tune. Those who, like myself, use their machines almost entirely for business, have not time to be tuning up every day. Let me say, in conclusion, that I am cordially in agreement with your correspondents who sign themselves "7-9 h.p." and "Loidis."

F. G. TOWNSEND.

### Petrol Consumption.

Sir,—I am rather surprised at the conclusion your correspondent comes to, after summarising the other letters on the matter, that 90 m.p.g. is all that one can expect from a  $3\frac{1}{2}$  h.p. single.

My present mount is a 1912  $3\frac{1}{2}$  chain-driven P. and M. I have ridden it nearly 3,000 miles, and the average mileage is 112 per gallon.

The machine, as you know, is by no means a lightweight—190 lbs. nett—I weigh 13 stones myself, and all the distance has been covered on give and take roads, going anywhere and up anything.

A recent run was 173 miles in Kent and Surrey, and that is about my usual day's run once or twice a week.

Regarding the discussion on gears with reference to petrol consumption, my gears are low, 5 to 1 and 9 to 1, although the latter is practically never used except for starting.

The engine has not been touched, has never given me a moment's trouble, and is pulling just as powerfully now as it did at first, and is just as amenable at slow speeds in traffic.

Transmission troubles, except for the eternal nuisance of lubricating, nil; in fact I have not had the least trouble of any kind. Why can't the P. and M. people and others give us an oil bath gear case for the chains? I rode a Sunbeam push bicycle thousands of miles and never even saw the chain.

Permit me to add the usual disclaimer. H. D. LEE

### The Price of Motor Cycles.

Sir,—As an engineer, with eleven years experience in the motor cycle trade, I read with interest Mr. W. J. Fitchett's letter on the above subject, and have much pleasure in replying to his request for suggestions.

In the first place, there is no doubt about there being a demand for a machine of about  $3\frac{1}{2}$  h.p. at a price below the present £48 to £60 article. Given a reliable machine, the difficulty would be to keep pace with the orders. At the price mentioned, the machine would be within the means of a very large class of buyer, both for business and for pleasure, who is at present absolutely uncatered for, and who looks at a second-hand machine with distrust.

It would be advisable to retain the magneto, even at a slight increase in price, as previous to its general adoption nine-tenths of motor cycle roadside troubles were due to ignition. Nowadays, we never hear of anything but tyres causing delay on a journey, no matter how great the distance. The dry battery, with suitable coil and contact breaker, is a good and reliable ignition, but the public have been educated up to the magneto, and will have nothing else. I have proved this daily in selling second-hand machines of old pattern; in fact, many otherwise good bicycles are absolutely unsaleable until converted to magneto.

Almost the whole of the parts, usually nickel-plated, would be stove enamelled with advantage to user and manufacturer.

The engine should be of dimensions large enough to guarantee long life without extensive repairs. Above all bearing areas should be, if anything, in excess of present day standards. There is no doubt that if in daily use in all weathers, connecting rod bushes require renewing more frequently than is good for the reputation of the machine. This applies to engines of the highest grade.

In the hands of the public, the small lightweight engine requires complete overhauling at frequent intervals to maintain its original horse-power, the working parts being of such unusual dimensions.

Some few years ago I went thoroughly into this subject, and it was only lack of capital that stopped me going into business on my own account to put a machine of this type on the market. With an article built on the right lines there is not the slightest doubt about Mr. Fitchett's venture being an immediate commercial success, and he has the best wishes of  
J. C. HARLEY GILL.

Sir,—The letter in a recent issue on this subject opens up a question of great interest and importance to the majority of motor cyclists.

At the present time we are in the midst of a boom of which the manufacturers are availing themselves to the fullest extent, and one can scarcely blame them for doing so; but at the same time, many are finding the cost of

motor cycling considerably higher than they anticipated, and the growth of the movement, though very rapid, is curtail in consequence. I admit the modern motor cycle is a beautiful piece of work, but do not agree that it is of value for the money. I think that a reduction in price could be made which would still leave a fair trading profit. How is it that many firms manage to buy engines, frame tanks, etc., and assemble a machine with everything of the very best at prices considerably below those charged by most of the big firms who do this work for themselves and save these various profits of different firms? The high prices paid by a motor cyclist for his needs and luxuries seem to me to be most pronounced when he (as I do) requires a two or three-speed gear. I can buy one of the standard three-speed hubs for a push cycle for 25s., but if I want one for a motor cycle I am asked £10 10s. Now I ask, as a matter of commonsense, what is there to justify this enormous difference in price? Of course there is the clutch, a control, and the gear is stronger all through, but surely it should be ample to cover the cost. If a sidecar hub wanted, £2 2s. extra. Why £2 2s.? Surely a little extra strength does not justify this extra charge any more than that a clock should cost any more than a watch. If the possessor of an old machine wishes to put on a counter-shaft two-speed gear, again he is asked to pay £10 10s. for it. Here the price seems even more exorbitant than in the other case, when one considers the comparative simplicity of a two-speed counter-shaft gear.

Is there no manufacturer who is wise and bold enough to offer for £5 a reliable, well-made gear of this type with chain drive to counter-shaft and belt by 8in. pulley to rear wheel, which can be simply attached to existing machine on removing the pedalling gear?

There is a huge market awaiting him and undoubted success, provided his gear is simple and reliable. If it can be done at the price, why not? There seems to me to be nothing in the manufacture to prevent it.

So long as manufacturers have to spend huge sums on an army of trade riders, and, possibly, in some cases supply a profit to pay a dividend on an over-capitalised push cycle business, and whilst artificial prices are also maintained by trust methods, so that free trade amongst retailers is prohibited, so long will motor cyclists have to pay these high prices.

It is the history of the push cycle business over again when, as some of us remember, £15 to £20 had to be paid twenty years ago for a decent solid tyred safety, and accessories were priced in proportion. This righted itself in time, and so will the present inflated prices of the motor cycle trade.

How can manufacturers be expected to trouble about price competition when their whole possible output is sold twelve months in advance?  
B.Sc.

JUNIOR T.T. COMPETITORS.

P. W. Owen (2½ h.p. Forward) who finished fifth.

H. Petty (2½ h.p. Singer) seventh to finish. This was the first single round.

### Whose was the First Ascent?

—With reference to my climb up Dinas Mawddwy, I my first ascent at 9.45 in the morning, another at then drove on to Bala, and on the way met Mr. Mills Enfield going to the hill, so I think that it is clear was first. After lunch, on going again with Mr. we met Mr. Mills returning. R. LORD.

### Petrol Consumption.

—No doubt most readers are interested in the letters ring lately in your columns regarding petrol consumption and many, like myself, would be delighted to obtain wonderful results claimed. I would suggest to those that the correspondence would prove more interesting instructive if they would kindly tell us how these results obtained by others. I have keenly followed all that been written on the subject the past few weeks, but apart being told that certain makes of machines have running from 100 to 150 miles on the gallon I have not any wiser in learning how others can do it. It does est altogether with the machine, for we find two nes of the same make giving entirely different results ridden by different riders, showing that much depends e manipulation.

ave lately taken to riding a 5 h.p. Indian, but up to the at I have not been able to get more than 50 m.p.g. ession, spark, and all else are in good order. Now will of our high mileage friends kindly give up the secret, give us some definite particulars of the way to run nically with machines of similar make to their own? A. EASTGATE.

### Should Ladies Race?

—I seem to have "put my foot into it" rather badly, scarcely think that Miss Walker has herself shown the ey which she has found wanting in me. In dealing ny letter she says, firstly, that she did not write to give e. But I never said that she did so write. I said he had taken offence. Again, I wonder how often she up her references when searching for a suitable name ar journalist. Stiggins is, of course, a character from twick Papers." The earlier chapters about him make ar that the only thing he could do really well was to o phenomenal quantities of pineapple rum and hot ed toast.

ally, he is summed up in chapter 45 as one of those e prophets and wretched mockers of religion who, at sense to expound its first doctrines or hearts to feel st impulses, are more dangerous members of society he common criminal." I do not for a moment suppose Miss Walker meant quite all that; possibly it was just e of carelessness, but I think she will agree that I

had every excuse for thinking that she had taken offence. Lady motor cyclists may quite logically maintain that they have as much right to risk life and limb as the men; but on the other hand many ladies are just beginning to realise that the motor cycle is a practicable vehicle.

One or two really serious accidents at hill-climbs, etc., would revive the idea among the indiscriminating—and they are many—that the motor cycle is dangerous, and it does seem that ladies could do a real service to the movement by abstaining from risky work until the lady's machine is a little more firmly established. D. S. HOLMES.

### The Danger of Uncontrolled Dogs.

Sir,—I notice a letter in your issue of June 27th, from Mr. S. H. Merrick, in which the writer states that he suggested the dog's black list "about a year ago." May I remind him that the dog's black list was in operation long before the idea appears to have occurred to him. The scheme was evolved by me, and first saw the light in my contribution to the National Cyclist's Union *Review*, of August, 1909. It was taken up by the N.C.U., and Mr. L. C. Wilks (Gordon House, Woodford Road, South Woodford, Essex) has been hon. secretary of the scheme and keeper of the black list ever since. Dangerous dogs should be reported to Mr. Wilks, who will enter them on his list and advise the owners of their dog's propensities. H. W. BARTLEET.

### Jake de Rosier Fund.

Sir,—In your issue of June 27th you ask if a motor cyclist will make a collection on behalf of poor Jake de Rosier. I beg to state that during my visit to the Isle of Man I collected a sum of £5 11s. 6d. for this unfortunate racing man. Many will remember that he came off his machine through no fault of his own at a speed of over ninety miles an hour and will never be able to ride a motor cycle again, hence his living is taken away. I therefore think it becomes every motor cyclist to sympathise and help a fellow sportsman and his young bride. I therefore appeal to all motor cyclists to co-operate with me in this most urgent and needful cause, and therefore propose to open a shilling fund for poor Jake. All riders or others who send me a subscription may feel assured that it will be directed to the right quarter and a receipt for the amount will be sent if desired.

I may add that I know de Rosier very well and always found him a fine sportsman. I had many opportunities of meeting him when he was over here. Others will remember his splendid racing at Brooklands, and I think all will agree with me he was an "artiste" on a motor cycle. Many American riders have sent subscriptions to the Arthur Moorhouse memorial fund, so let us send something to Jake de Rosier. Address to me as under.

T. A. CARTER.

The Purley Motor Cycle Depot, 6, High Street, Purley.

Nottingham motor cyclists outside the "Cat and Fiddle" Inn, en route for Liverpool and the Isle of Man, to witness the Tourist Trophy Races. Mr. E. G. Young has taken a T.T. party to the Island several times.

# M.C.C. Fourth Annual Race Meeting.

A well organised event. A cyclecar wins the car race.

The start of the fourth race, which was for any type of motor bicycle with single-cylinder engine up to 560 c.c.

**T**HE Motor Cycling Club was favoured with a fine day for its annual meeting at Brooklands, and successfully carried out a very full programme. The starts were made with great punctuality, and no accident marred the day's sport. The races all started and finished at the fork, and the finishing straight was not used throughout the day.

The first event was a handicap for single-cylinder touring machines up to 560 c.c., distance three laps, and was supported by a large and representative entry of sixteen. W. Cooper's Bradbury was very fast, but, unfortunately, the engine seized on the last lap just as he was picking up the winners. Result:

Rider and machine.	Bore and stroke.	H'cap M. S.	Time M. S.	Speed m.p.h.
1. N. O. Soresby (1-cyl. Rudge)	85 x 88	0 45	8 5	60.54
2. D. H. Noble (1 Rover)	85 x 88	0 12		
3. H. C. Mills (1 Green-Precision)	85 x 88	scr.		

H. de Vack (Motosacoché) was unlucky in having his belt jump off at the start, but both he and O. L. de Lissa on a similar machine ran with the utmost regularity throughout the day, and we unofficially timed their little mounts to be lapping at over 38 m.p.h. regularly. Karslake's Rover was running in full touring trim with belt guards, etc., the only alterations being racing bars and a neat foot-controlled oil pump.

E. B. Ware (Zenith), wins the sidecar race from F. W. Barnes on a similar machine.

## Brough Averages Over 66 m.p.h.

Second event, handicap for touring twins between 4 and 1,000 c.c.; distance, three laps. Result: Time. Speed.

1. G. Brough (1-cyl. Brough)	85 x 85	scr.	7 25	66
2. R. E. Guest (2 Matchless)	85½ x 85	0 12		
3. H. H. Huckle (2 Zenith)	76 x 54½	1 12		

Brough had an easy win. He is comparatively a novice at Brooklands racing, but rode beautifully, and with a little more experience would be a very formidable opponent of our leading track riders. He was handicapped by having touring handle-bars and a hand-operated oil pump, but 18 h.p. twin Brough appeared to be the fastest machine on the track. Huckle had some difficulty in getting away, and thus lost a good deal of his handicap.

The fourth event was a handicap for any single-cylinder machine up to 560 c.c.; three laps. Results:

1. T. Peachy (1-cyl. Premier)	85 x 88	2 12	9 0	54.
2. R. Croucher (1 Kerry-Abingdon)	85 x 88	2 30		
3. F. C. North (1 Ariel)	86½ x 85	0 51		

Croucher's machine ran very well throughout and looked like a winner. Peachy had trouble with his tank, but nevertheless made a fine performance, his auxiliary exhaust Premier being extremely fast. Both Mills and Garrett, their T.T. Green-Precisions were very fast, but both, strangely enough, suffered with plug trouble, though their performances in the Isle of Man would not have led one to expect this. Soresby's Rudge was going very well, and Barn (Zenith) obtained a great speed, but was unable to pick his handicap.

## The Lightweight Race.

Handicap, any type of motor cycle up to 350 c.c. Distance three laps. Results:

1. F. W. Barnes (1-cyl. Zenith)	76 x 65½	scr.	9 30	51
2. W. A. Jacobs (1 Singer)	69 x 80	0 18		
3. P. C. Patterson (2 Humber)	60 x 60	0 30		

Barnes won easily from the scratch mark.

The sixth event was a handicap for any type of motor car. Three laps. Results:

1. W. T. Wainwright (4-cyl. Rover)	75 x 130	2 54	10 16	48
2. C. Gordon Watson (4 F.N.)	82 x 120	1 48		
3. C. M. Keiller (4 Vauxhall)	90 x 120	scr.		

J. T. Wood drove his G.W.K. cyclecar (2m. 30s. std.) in this race, but was troubled with a choked carburettor. Keiller made up for it, however, later in the afternoon winning the Albert Brown Challenge Trophy on a similar machine.

C. M. Keiller (G.W.K. cyclecar), winner of the Albert Brown Trophy.

The seventh event was a handicap for any motor cycle between 400 and 1,000 c.c.; four laps. Results:

1. R. Croucher (1-cyl. Kerry-Abingdon) ... 85×88 4 4 12 10 55.64
  2. S. F. Garrett (1 Green-Precision) ... 85×88 1 36
  3. E. B. Ware (2 Zenith) ... 76×54½ 1 36
- In this event G. Brough (scratch) rode a very sporting race, but only just failed to get a place. The Rovers ridden by Able and Newsome appeared very fast. Milner's Indian did not seem to be going its best.

### Two Lap Sidecar Race.

Handicap for single-cylinder machines with sidecars; two laps. Results:

1. R. Croucher (1-cyl. Kerry-Abingdon) ... 85×88 1 10 7 42 42.3
  2. E. J. Watson (1 Swift) ... 85×88 0 56
  3. F. C. North (1 Ariel) ... 86½×85 0 34
- North, who was troubled with his gears slipping out of engagement, made a very close finish with Watson.
- The ninth race was a handicap for any twin-cylinder motor cycle with sidecar; two laps. Results:
1. E. B. Ware (2-cyl. Zenith) ... 76×54½ 2 10 7 21 44.39
  2. F. W. Barnes (2 Zenith) ... 90×77½ scratch
  3. F. C. Haward (2 Zenith) ... 76×85 1 10
- F. W. Barnes made a splendid show. He started scratch, travelling at a great pace, nearly caught E. B. Ware, but had 2m. 10s. start.

### A Cyclecar wins the Brown Trophy.

The tenth race was a ten lap handicap for cars up to 30 h.p. (R.A.C.) for the Albert Brown Challenge Trophy. The M.C.C. appears to treat cyclecars and cars as one type of vehicle, for the G.W.K., which is a cyclecar, competed in two of the car events and won the challenge trophy. Results:

1. C. M. Keiller (2-cyl. G.W.K.) ... 86×92 33 36 48.53
2. F. J. Jenkins (4 Rover) ... 75×130 scratch
3. S. G. Cummings (4 Crespelle) ... 75×150 scratch

The G.W.K. was a late entry, but made a particularly fine performance. The win, however, was extremely lucky, as the machine crossed the line with its engine stopped owing to a choked jet. C. Gordon-Watson's F.N. looked like a winner, but something went wrong in the first lap, which put him out of the race.

The eleventh item was the club motor cycle championship, a handicap for any touring motor cycle, for the "Harry Smith" gold Challenge Cup. Result:

1. R. E. Guest (2-cyl. Matchless) ... 85½×64 2 40 25 23 63.95
2. H. C. Mills (1 Green-Precision) ... 85×88 2 40
3. E. B. Ware (2 Zenith) ... 76×54½ 4 0

This event drew thirty entries, and the large number of runners somewhat complicated lap scoring. Several competitors were making very fast laps, notably Barnes, Soresby, Brough, North, and Garrett. They were, however, unable to pick up their allotted handicaps.

So ended a very successful and well organised meeting. Messrs. F. T. Bidlake and A. V. Ebbelwhite (timekeepers) worked hard, and were most prompt with their results, and the organisation could hardly have been improved upon. There was some little difficulty in keeping spectators off the course at the fork, but W. Cooper officiated in his usual keen and masterly way, and accomplished wonders.

At the close of the meeting, a few thoughtless people careered round the track in the wrong direction, thus causing a good deal of unnecessary trouble and annoyance.

### INTER-CLUB TEAM COMPETITION.

The Woolwich, Plumstead, and District Motor Club is arranging an inter-club team trial, which will take place on the 20th inst. There are nine riders in each team, some with sidecars. There is apparently no hard and fast rule regarding the composition of the teams, as we notice that while one club has entered a team consisting of five sidecars and four singles, three teams have no passenger machines at all. The clubs which will take part are Brookdale M.C. (Catford), Purley and District M.C., Putney and District M.C., South-East London M.C.C., Streatham and District M.C.C., and Woolwich and District M.C.

THREE WINNERS AT THE M.C.C. RACE MEETING.

(1.) N. O. Soresby (Rudge), winner of first race.

(2.) F. W. Barnes (Zenith), winner of lightweight event.

(3.) G. Brough (8 h.p. Brough), who won the second race and attained the fastest speed of the day.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

July 11th	...	9.13 p.m.
" 13th	...	9.11 "
" 15th	...	9.9 "
" 17th	...	9.7 "

### At the M.C.C. Race Meeting.

We noticed Harry Bashall, fresh from his Isle of Man victory, among the spectators at the Motor Cycling Club's meeting at Brooklands. The G.W.K. cyclecar was seen to climb the test hill in good style with four passengers.

### Indian Machines and Racing.

An American contemporary says that "there are strong rumours going the rounds in America that the Hendee Manufacturing Co. are going to retire from racing altogether as a result of poor Moorhouse's untimely end."

### 60 Miles in 60 Minutes on a Lightweight.

Who will be the first to cover sixty miles an hour on a 350 c.c. Junior machine? The matter is at present occupying the attention of riders of this class of machine, and at least one attempt may be expected very shortly. Meanwhile, S. Wright's hour record of 58 miles 1,408 yards on a 2½ h.p. twin Humber is in jeopardy.

### Traffic Census.

Our contemporary *Motor Traction* has a yearly census taken of the total traffic passing over Putney Bridge between 9 a.m. and 9 p.m. on a Sunday in each year. The last count was on Sunday, June 30th, and shows a remarkable increase in the number of motor cycles. In 1911, one hundred and ninety-three motor cycles were counted; this year the total is three hundred and forty-seven. Of this number, one hundred and forty were sidecars. The remaining passenger machines, to the number of five, were made up of tricar and other three-wheelers.

### Scottish Six Days' Trials.

The following additional entries have been received for the above trial, bringing the total number to eighteen: R. Lord (6 h.p. Rex), Rev. P. W. Bischoff (3½ h.p. Rudge), F. C. North (3½ h.p. Ariel), Eric B. Keiller (3½ h.p. Rudge), W. Pratt (3½ h.p. P and M.), and G. T. Gray (3½ h.p. Rudge). There has also been a slight alteration in the route. On the third day the section from Braemore via Ullapool to Lairg has been cut out, and riding north the route will be Dingwall, Ardgay, Lairg, to the North Coast round by Tongue and Thurso. Then on the forth day down the East Coast via Helmsdale, and to Garloch via Dingwall Braemore, and Little Gruinard.

### British Machines Barred.

A German club, not 100 miles from Munich, recently announced a 200 miles reliability run. Owners of English machines were informed, on making application for entry forms, that as English-built motor cycles would reduce the chances of the home manufactured article, their entries could not be accepted. What would be said if we were to adopt such a policy in this country?

### A Trial Trip on a Williamson.

Recently, at the suggestion of Mr. W. Williamson, the maker, we enjoyed a short trip in a Williamson sidecar, with 8 h.p. Douglas twin water-cooled engine. The bicycle, which is an enlarged edition of the 2½ h.p. Douglas, we have already illustrated. The machine, as may be supposed, has ample power, and climbs hills in splendid style. We surmounted a quarter-mile rise of approximately 1 in 7 on top gear with consummate ease, the engine pulling with certainty even at the summit when the speed had fallen low. It is smooth running, silent, and has a fine turn of speed. The Williamson sidecar is sure to appeal to that section who have been used to a T.T. bicycle and now desire to take a passenger.

### SPECIAL FEATURES.

THE SUCCESS OF THE TWIN.  
TOURIST TROPHY LESSONS.  
PARIS-LIEGE RUN.  
M.C.C. BROOKLANDS MEETING.

### Two Trials on Saturday Week.

There are two open reliability trials fixed for Saturday, July 20th. The Birmingham M.C.C. will hold its postponed trial for passenger machines over a course of 180 miles, embracing the Cotswold and the North Middlesex M.C.C. will hold a twelve hours' trial for solo and passenger machines from Hampstead to Stratford-on-Avon and back.

### Jake de Rosier Fund.

With reference to "Ixion's" suggestion that a collection should be made in the Isle of Man for Jake de Rosier, Mr. T. J. Carter, of the Purley Motor Garage, informs us that he collected £5 11s. 6d. mostly in one shilling donations. The sum will be forwarded to *The Motor Cycle Illustrated* of America. We have received from Mr. William Macneill, Edwinstown, Llandilo, South Wales, a cheque for £2 for de Rosier, which we are forwarding direct to him at the Crocker Street Hospital, Los Angeles, California.

M.C.C. FOURTH BROOKLANDS MEETING.

D. H. Noble (Rover) and H. C. Mills (Green-Precision) neck and neck in the first race at the M.C.C. race meeting at Brooklands last Saturday.

**Gibson's Condition.**

The latest information concerning John Gibson, whose sad accident we reported last week, is of a quite satisfactory nature, so his doctor states. He is now getting quite well.

**The Dutch Trial.**

Both last year's and this year's T.T. winners will take part in the Dutch Trial on August Bank Holiday, O. C. Odrey having decided to accompany F. Applebee, who is one of the chosen secretists.

**Day of the Associated Clubs at Brooklands.**

There will be two motor cycle events at its meeting—(1) Motor cycle short distance handicap (distance about 5½ miles), the winner will receive a cup presented by *The Motor Cycle*; and (2) Motor cycle inter-club team race (distance about 5½ miles). Each team to consist of one single-cylinder machine up to 500 c.c., one multi-cylinder up to 750 c.c., and one passenger machine up to 1,000 c.c. The winning club will receive a trophy and each member of the team a silver Arkomer medal.

**Grand Prix de France.**

The Motor Cycle Club de France has definitely fixed on August 25th (Sunday) the date of its great race of 450 kilometres, embracing the following route: Fontainebleau, Arbonne, Achères, Vry, back to Fontainebleau. It would appear that the M.C.F. has taken up the question of a Grand Prix race where the M.C.F. has dropped it. There will be classes for all machines from 250 c.c. to 1,300 c.c., the latter being for sidecars. Entry forms and full particulars can be obtained from the M.C.F., 48, rue St. Ferdinand, Paris.

**Track Racing at Cambridge.**

At the Cambridge Town and County Cycling Club's sports on the 4th inst., there was a five-mile motor cycle handicap. The final heat of this event, in which three competitors took part, viz., Hodgkinson (Tottenham), 350 yards, Potter (Cambridge), 400 yards, and Harry Martin (Croydon), scratch, proved the finest race ever seen in Cambridge. As the riders flashed over the line there was not a machine's length separating any of the riders. Martin finished first, but was disqualified for passing on the inside, the race being awarded to Hodgkinson.

**Engine Speeds in the T.T.**

It is interesting to note the minimum average revolutions per minute of the engines used by the leaders in the T.T. races, as it conveys some idea of the strenuous nature of the test of engines. Ignoring stops, and also the fact that low gears were frequently in operation, the figures show that the minimum revolutions during the whole of the race were:

SCOTT (F. A. Applebee).—Revolutions per minute, 1,873; total (3 to 1 gear), 5,000.

TRIUMPH (J. R. Haswell).—Revolutions per minute, 2,420; total (4 to 1 gear), 3,500.

DOUGLAS (W. H. Bashall).—Revolutions per minute, 2,478; total (4½ to 1 gear), 2,500.

**FUTURE EVENTS**

- July 15.—Irish Open End-to-end Reliability Trial.  
 „ 18 & 20.—South Wales A.C. and Cardiff M.C. Open Hill Climb at Caerphilly  
 „ 18.—Tatnall & District M.C.C. Open Hill Climb.  
 „ 20.—Birmingham M.C.C. Open Cyclecar Trial.  
 „ 20.—B.M.C.R.C. Race Meeting.  
 „ 20.—Liverpool A.C.C. Open Speed Trials.  
 „ 27.—R.A.C. Associates' Gala Day at Brooklands.  
 „ 27.—Oxford M.C.C. Open Speed Trials.

**A Real Lightweight.**

A 2½ h.p. lightweight, weighing about 90 lbs. sounds very attractive. Such a machine is being built, but it is not intended for ordinary touring purposes. A special Douglas machine has been put in hand for S. L. Bailey for short distance races. It will be reduced in weight to the finest limits, and will be equipped with single tube tyres. Bailey anticipates that it will attain a speed of 65 m.p.h.

**Cyclecars at Olympia Motor Cycle Show.**

The Motor Cycle Manufacturers' Union, who, in conjunction with the Society of Motor Manufacturers and Traders, are the organisers of the Olympia Motor Cycle Show, have decided to admit for exhibition purposes all cyclecars which come within the R.A.C. and A.C.U. definition, viz., chassis weight unladen with tyres 6 cwt., engine capacity not exceeding 1,100 c.c. This will be interesting news to many manufacturers of cyclecars, as there has been some doubt as to whether any four-wheeled motor cycle vehicles would be admitted to the motor cycle show at all.

**A Good Response.**

With the British contribution of over £15, the Jake de Rosier fund has now reached a total of over £100.

**A Difficult Test.**

There are thirty entries for the Coventry and Warwickshire Motor Club's reliability trial for the Manville Trophy next Saturday. The course is of approximately 180 miles, and includes eleven difficult hills.

**Our Recommended Formula.**

The formula recommended by *The Motor Cycle* for hill-climbing competitions is being largely adopted. It is now being used in South Africa, whilst Australian clubs adopted it some time ago, and, of course, the leading clubs at home have used it for a long time. The formula is:

$$\frac{C \times T^2}{W}$$

C = capacity.

T = time.

W = weight.

Squaring the time is found to suit late models of motor cycles, which are so fast on hills, much better than the old A.C.U. formula.

**B.M.C.R.C. Fifth Members' Meeting.**

The next members' meeting will take place on the 20th inst., when there will be five events as follow: The Third 1912 Time Trials, the Junior Five-lap Scratch Race, the Senior Five-lap Scratch Race, All-comers' Five-lap Handicap, and Brooklands Test Hill-climb. For this meeting entries close on Saturday next. On August 24th the Brooklands T.T. Race will be held, starting at 2 p.m. Prizes are offered for both senior and junior competitors as follows: First, a silver cup value £5 5s.; second, club's gold medal; third, silver medal; fourth, bronze medal. Entrance fee, non-members 10s.; members 5s.

AN EXCITING FINISH AT THE CAMBRIDGE SPORTS.

A five miles handicap was included in the Cambridge Town and County Cycling Club Sports. Our photograph shows the final heat, in which all finished within a machine's length. The riders are H. Hodgkinson leading, H. Potter second, and Harry Martin third.

## THE PARIS-LIEGE RUN.

THE above contest, which its organisers, *L'Aero* and the Liège M.C., have called "Le Petit Londres-Edinbourg," was run off on Sunday last between Paris and Liège. The route was *via* Rheims, Sedan, Bouillon (hill-climb), Laroche, and Aywaille, a total distance of 250 miles. The competitors were divided into five classes, as follows: 250 c.c., 350 c.c., 500 c.c., above 500 c.c., and sidecars. The following average speeds had to be maintained: Class 1, 17.4 m.p.h.; Class 2, 19.5 m.p.h.; Class 3, 22.3 m.p.h.; Class 4, 24.8 m.p.h.; sidecars, 22.3 m.p.h. Competitors were penalised one mark for each minute early or late. All machines were sealed on the Saturday afternoon at the garage Gerber from 2 to 6 p.m., and had to conform to touring requirements, and to be fitted with spring forks, efficient mudguards, two brakes, luggage carrier, rear wheel stand, lamp, and generator; silencers were compulsory, but a cut-out could be used. Handle-bars were not allowed to extend below the top tube of the frame.

The entries, which numbered ninety-two, included Vernon Taylor and W. D. South (Rudges), A. D. Arter (James sc.), and A. J. Dixon (Singer).

English machines ridden by foreigners totalled seven: New Hudson, two; Rudge, three; B.S.A., one; and Triumph, one. England was therefore represented by eleven machines.

Other countries were represented by their various makes as follows, the riders being mostly members of the Antwerp and Liège clubs, Belgian Moto Club, French Touring

Moto Club, A.C.C.F., and M.C.C.F.: Twenty - one N.S.U.'s were entered in the competition; F.N., fifteen; Wanderer, thirteen; Sarolea ten; Alcyon, eleven; Peugeot three; Clément, three; Moto sacoché, three; Scaldis, two.

At 2.30 a.m., competitor in Class 1 were sent off in groups of four from Villiers sur-Marne. The other classes followed at intervals of one hour, the sidecars being despatched at 5.30.

The combined speed trial and hill-climb at Bouillon commenced at a quarter to two, and consisted of a section of level running, followed by a climb of 1 in 15 to 20; distance, two kilometres, flying start.

Seventy - five of the ninety-two entrants left Villiers sur-Marne on Sunday morning last, and of that number fifty-eight arrived at Liège the same evening without loss of marks. The event was voted on a sides an unqualified success. In consequence of the late arrival of most of the riders and the long

calculations necessary to arrive at the results of the hill-climbing test at Bouillon the names of the winners of the five classes are not available this week.

The first arrival at Liège was Everaers (N.S.U. 500 c.c.), followed by Pire (Sarolea), and Thoen (four-cylinder F.N.), the fourth arriving being Milly (B.S.A.), sixth A. J. Dixon (Singer), seventh Cussac (Wanderer), eighth Chartier (Wanderer). The two English riders of Rudge, Vernon Taylor and W. D. South, arrived thirty-eight and thirty-ninth, A. D. Arter (James sidecar) forty-third and Gutteret (Rudge) forty-eighth.

THE T.T.—CONTRASTS IN CORNERING.

1. S. L. Bailey (Douglas) in the first round of the Senior Race has a spill at the Ramsey hairpin. 2. F. A. Applebee (Scott) overtaking J. R. Haswell (Triumph) at the corner in the last round of the Senior Race. 3. A. Kirk (Triumph) in a peculiar attitude on the hairpin.

## Club Competition Results.

### Speed Trials at Saltburn.

The motor cycle race at Saltburn speed trials, on Saturday last, was won by G. W. Phillips, riding a 5 h.p. Blumfield.

### Gloucester M.C.C.

A 100 miles reliability trial was held on the 4th inst., the course embracing Chepstow, Ross, and Malvern. There were nineteen competitors, the leaders being: 1, B. F. Peplow (Matchless sc.), error 57s.; 2, W. B. Gibb (Douglas), error 1m. 10s.; 3, P. R. Currell (Rudge), error 2m. 17s. The first and second won the silver cups offered for the best passenger and solo machine respectively.

### Haverstock M.C.C.

A speed-judging contest took place on the 7th inst., the winners being: 1, H. Moliver (Rudge multi and sc.); 2, A. Lunnon (3½ Zenith and sc.); 3, W. Bishop (2½ Brown); 4, D. Ackland (Rudge multi and sc.).

A petrol consumption trial will be held on the 21st inst., and particulars may be obtained from the hon. secretary, Mr. H. Moliver, 81, Prince of Wales Road, N.W.

### Dublin and District M.C.C.

The Dublin and District Motor Cycle Club held a hill-climbing competition at Ballymacroe Hill on Saturday last. There were three classes, and in addition to an award for fastest time in each, there was a prize on A.C.U. formula. The results in the three classes were as under:

#### CLASS A.—Under 340 c.c.

		Time. m. s.	Fig. of Merit.
1.	W. G. Greene (2½ A.J.S.)	2 6	154
2.	W. F. Parker (2½ Douglas)	2 6	226

#### CLASS B.—Under 520 c.c.

1.	F. J. Walker (3½ Rudge)	1 42	601
2.	T. E. Greene (3½ Rudge)	1 5	650
3.	O. G. Price (3½ Rudge)	1 8	661

#### CLASS C.—Over 520 c.c.

1.	J. J. Harvey (5 Bat)	1 0	811
2.	B. B. Harvey (7-8 Bat)	1 2	1023

### Merthyr M.C.C.

A hill-climb was held on the 4th inst. at Penydyryn Hill. Class I. 1, J. Rogers (Rudge); 2, I. E. Lewis (B.S.A.); 3, D. Williams (Bradbury).

Class II. 1, I. E. Lewis (B.S.A.); 2, D. Williams (Bradbury); 3, J. Rogers (Rudge). Fastest time of the day was made by J. Rogers.

H. A. Shaw, of Illinois, U.S.A., on his Thor VII. at Brooklands last Saturday. He is touring Europe. The machine illustrated is one of the best known in the States.

## ROUND THE COAST OF DEVON AND CORNWALL.

The twenty-four hours' reliability trial recently held by the Exeter and District M.C.C. resulted in P. Pike (3½ h.p. Humber) and six other competitors finishing within schedule time. It was therefore decided to put the septet to a further trial to determine the winner. In the latter trial a difficult course of 130 miles in the Western Counties was covered, and included the notorious Porlock Hill, the time allowed being six and a half hours. Mr. Pike, riding his Humber, was ultimately declared winner, and secured the Hancock Silver Cup.

## PARIS-LIEGE RUN.

### LIST OF GOLD MEDAL WINNERS.

At the moment of going to press we have received a list of the gold medal winners in the above run, which are as follow:

#### CLASS I.—250 c.c.

Lambelin (Scaldis)	Laloup (Alcyon)
Marechal (Alcyon)	Cardol (Alcyon)
Paguay (Alcyon)	Gaussin (Alcyon)
Simon (Wanderer)	

#### CLASS II.—300 c.c.

Beer (F.N.)	Greame Fenton (Clément)
Poznensky (Sarolea)	Golaz (Clément)
Devaux (Peugeot)	Lacroix (Peugeot)

#### CLASS III.—500 c.c.

A. J. Dixon (Singer)	Mathot (Wanderer)
Vernon Taylor (Rudge)	Dewaele (F.N.)
W. D. South (Rudge)	Dedroog (F.N.)
Pire (Sarolea)	Defays (Wanderer)
Thoen (F.N.)	Mathot (N.S.U.)
Lassois (Sarolea)	Touchet (Wanderer)
Foubert (N.S.U.)	Corombelle (F.N.)
Cassac (Wanderer)	Berens (N.S.U.)
Collin (Sarolea)	Colette (Wanderer)
Delune (N.S.U.)	Lambotte (Wanderer)
Cardol (N.S.U.)	

#### CLASS IV.—Twins.

Janssens (N.S.U.)	Devergraum (N.S.U.)
Lamborelle (N.S.U.)	Pierard (N.S.U.)
Dupont (N.S.U.)	

#### CLASS V.—Sidecars.

A. D. Arter (James and sidecar)

# MILITARY MOTOR CYCLING NOTES.

By "CELERITER."

**M**Y remarks this week will be brief, but I venture to think they will be very much to the point. I have it on the very best authority that within the next few months the military history of the motor cycle will advance by leaps and bounds, and I hope in the course of the next week or two to indicate the lines along which progress will be made.

For some months now a few active and intelligent brains have been devoting much time to studying the possibilities of the motor cycle from the military point of view, and the conclusions arrived at will be as astoundingly novel as they will be interesting, not only

**THE HULL TEAM.** Left to right, Sergt-Major Evans (2½ h.p. Centaur), J. A. Latze (Matchless), W. T. Tarnfield (Rex), G. McWaine (Matchless), and W. Jennison (Triumph).

to military men throughout the world, but to all motor cyclists. The confidential notes that I have before me open up totally new fields to the motor cyclist—fields which, so far as I am aware, have hitherto been untouched, even in the imagination of our most fictitious writers. Whether these fields will prove fecund is another matter, but the outlines which I hope shortly to make public are at least thrillingly novel and totally original.

## The Legion Mobilisations.

The authorities have been much impressed by the splendid achievements of those who have taken part in the various mobilisation trials organised by the Legion; they have succeeded in the object for which

they were instituted, and have disproved many of the pet fallacies entertained by those who did not know. It now only remains for our motor cyclists to come forward in their thousands and join the Legion of Motor Cyclists, which body is rapidly building up an organisation of national importance that must eventually earn the recognition which it deserves.

Those members of the Legion who have not yet provided themselves with the official badge are requested to do so at once by applying to the Hon. Secretary, 128, Jermyn Street, W., enclosing 1s. 4d. to include postage. The first issue is rapidly becoming exhausted, and some time must elapse before the next issue can be struck. In the meanwhile some important developments are likely to occur, and those Legionaries who have neglected to provide themselves with badges may well have cause to regret their tardiness.

## The Third Mobilisation Test.

The third mobilisation test was held at Nottingham on Sunday last, and this time was in the nature of a team test, an organising officer selecting a rendezvous for each team. In connection with the test, only one brief reference was published in this journal, but the response was excellent. Prompt to the stroke of 1 p.m. the whole of the Cheshire team arrived in the Nottingham Market Place, which soon presented an animated scene as members of the Hull team arrived, followed by sections from Peterborough, Manchester, Coventry, Bradford, York, and elsewhere. The Cheshire team, under Commander J. J. Darlow, made the best performance. The test was voted most enjoyable by all the participants.

## Autumn Manœuvres.

This year's Army manœuvres are to take place in the vicinity of Cambridge and Thetford from the 13th to 20th September. The War Office has already approached the Auto Cycle Union to provide motor cyclist orderlies for the umpires and directing staff, but the Legion of Motor Cyclists will furnish all riders required for the combatant forces from amongst its own members. Those motor cyclists, therefore, who are not already members and are desirous of taking an active part in the manœuvres, are advised to become members of the Legion.

A group of motor cyclists who participated in the third mobilisation test, assembled in the Nottingham Market Place.

## A Run on a Scott Sidecar.

## THE NEW SCOTT SIDECAR WITH PATENT SUSPENSION.

(1.) Mr. and Mrs. Eric Myers, competing in the Douglas gymkhana on a Scott.

(2.) The special straight tube frame showing method of springing.

(3.) Rear view showing dummy axle, also frame tubes. The sidecar is attached to the bicycle at four points.

**A** PATENT has been taken out by Mr. Alfred A. Scott for a special form of sidecar frame with an entirely original method of springing. The first model was shown to us by Mr. Eric S. Myers, of Bradford, who will market the device. The sidecar body is slung on a bowed laminated spring in front, and, in addition to being supported on short spiral springs at the back, is mounted on bell crank levers and an auxiliary axle, the movement of which is con-

trolled by long spiral springs. Straight tubes are used throughout, and the sidecar is attached to the motor cycle at four different points, viz., at the steering head, base of crank case, seat tube, and chain stay. Mr. Myers took us a run over some of the most bumpy surfaces around Douglas, and no matter at what speed we travelled there was a total absence of bumping or jar. A run on a Scott sidecar is an experience to be remembered.

## THE MOBILIZATION TEST.—THE CHESHIRE TEAM, ALL OF WHOSE MEMBERS ARRIVED ON THE STROKE OF 1.0 P.M.

Right to left J. J. Darlow (commander, Rex), A. Stubbs (Precision), H. Stubbs (Triumph), E. C. Jensen (Triumph), C. Massasey (Triumph), J. J. Cockson (Matchless), W. H. Williams (Zenito), T. E. Leigh (Triumph), and C. R. Sprague (Triumph).

## TRIALS IN NEW ZEALAND.

The fourth annual two-day trials arranged by the New Zealand M.C.C. resulted:

## RELIABILITY TRIALS.—LIGHTWEIGHTS.

Rider and machine.	Fig. of merit.
1. C. Wright (2½ A.J.S.) ... ..	192.4
2. J. Beck (2¾ Douglas) ... ..	152.7

## HEAVYWEIGHTS.

1. V. Sutherland (3½ Triumph) ... ..	170.2
2. J. Hall (3½ Rudge) ... ..	154.4

## PRIVATE OWNERS.

1. R. Burn (3½ New Hudson) ... ..	198.2
2. J. V. Wilson (3½ P. and M.) ... ..	184.6

## HILL-CLIMB.—LIGHTWEIGHTS.

	Time.	
1. C. Wright (2½ A.J.S.) ... ..	480s.	459.5
2. T. B. Rhodes (2¾ New Hudson) ... ..	540½s.	479.9

## HEAVYWEIGHTS.

1. V. Sutherland (3½ Triumph) ... ..	466½s.	611.1
2. A. B. Collin (3½ Triumph) ... ..	—	651.3

## PRIVATE OWNERS

1. R. Burn (3½ New Hudson) ... ..	565s.	454.3
2. J. V. Wilson (3½ P. and M.) ... ..	433s.	507.3

## PETROL CONSUMPTION.—LIGHTWEIGHTS.

1. C. B. Rhodes (2¾ New Hudson) ... ..	42.4
2. C. Wright (2½ A.J.S.) ... ..	39.4

## HEAVYWEIGHTS.

1. J. Boucher (3½ Rudge) ... ..	39.4
---------------------------------	------

## PRIVATE OWNERS.

1. J. V. Wilson (3½ P. and M.) ... ..	58.2
2. G. E. Gibbs (3½ Rudge) ... ..	39.8

## BIDWELL BARTON.—CHAMPIONSHIP CUP.

1. W. Wilson (5 Indian) ... ..	189.4
--------------------------------	-------

## CLUB NEWS.

## WINNERS OF THE AUSTRALIAN SPEED TRIALS.

F. R. Limb (3½ Calthorpe), who won his class riding the only Calthorpe entered. Speed 53½ m.p.h. A. Bartholomew (6 h.p. "Rova"-Jap), seen on the right, was winner of the twin class. His speed was 59 m.p.h.

## Herts County A.C. (Motor Cycle Section).

A speed-judging competition was held near Sandridge on the 6th inst. Results: 1, A. K. Wells (Triumph), error 6s.; 2, R. H. Batchelor (Wanderer) and F. J. Beard (Triumph), 7½s.; 4, A. N. Guttridge (Rudge), 8½s. The slow running event was won by Miss M. Walker (Hobart), 8½ m.p.h.

## Blackpool and Fylde M.C.C.

The members' hill-climb held on the 22nd ult. resulted:

Class I. (lightweights): 1, N. H. Brown (2½ Hazlewood).  
Class II. (single-cylinders up to 560 c.c.): 1, F. Rees (3½ Rudge).

Class III. (multi-cylinders up to 1,000 c.c.): 1, S. O. Taylor (8 Rex-Jap).

Class IV. (sidecar machines): 1, F. Rees (3½ Rudge sc.).

Class V. (single-cylinders on time): 1, J. J. Day (3½ Bradbury).

Class VI. (multi-cylinders on time): 1, F. Naylor (7 Indian).

## North-west London M.C.C.

An inter-club hill-climb v. Oxford M.C.C. will be held on the 13th inst., at 4.30, at Arms Hill, Henley-on-Thames.

## Welsh A. and A.C.

The twelve hour motor cycle run took place on the 29th ult. over the following route: Swansea, Builth, Aberystwyth, Cardigan, Fishguard, and Carmarthen. The roads were bad for the early part of the trip, but four competitors succeeded in obtaining full marks, viz., Ivor L. Roberts (3½ B.S.A.), C. Simons (3½ Triumph), Edw. T. Strick (3½ Triumph), and Edgar P. Thomas (3½ Triumph).

## Ipswich and District M.C.C.

A members' hill-climb was held in Shrubland Park (by kind permission of Lord De Saumarez) on the 6th inst. The hill measured 640 yards, rising to 1 in 7. The surface, through recent heavy rains, was in a very louse condition. Results:

Class I. (touring models, single-cylinders, up to 500 c.c.)—1, K. Portway (B.S.A.), time 34½s.

Class II. (T.T. and T.T. roadsters, single-cylinders, up to 500 c.c.)—1, E. Herdman (Rudge), time 30½s.

Class III. (novices' class, single-cylinders, up to 500 c.c.)—1, M. K. Williamson (Premier), time 31½s.

Class IV. (lightweights up to 400 c.c.)—1, D. W. Popplewell (Singer), time 38½s.

Class V. (any machine up to 1,000 c.c.)—1, E. Herdman (Rudge), time 29½s. (fastest time of the day).

Class VI. (slow climb, knockout, same gear as employed in fast climb)—1, W. Low (V.S.)

Class VIII. (standing start, any machine)—1, E. Herdman (Rudge), time 37½s.

## Hants M.C.U.

The Bournemouth section of the above Union held a hill-climb last week on a short sharp rise with a gradient of 1 in 5. A thirty or forty yards start was allowed. The hill selected was unknown to any of the sixteen riders until they were taken to the spot. It is situated on the front at Bournemouth. Results:

Class I.—1, A. G. H. Alsford, Bournemouth (Douglas), 20s.; 2, Percy Kiem, Portsmouth (New Hudson), 20½s.; 3, F. Evers, Portsmouth (Hobart), 21s.

Class II. (3½ h.p. machines).—1, O. Goodman, Bournemouth (B.S.A.), 16½s.; R. C. Pearson, Portsmouth (Premier) and F. Tappenden, Portsmouth (Premier), 17s.

Class III. (open to all comers).—1, O. Goodman, Bournemouth (B.S.A.), 16½s.; 2, H. J. Bleach, Southampton (Bat-Jap) and A. G. Goodland, Bournemouth (Triumph), 16½s.

Class IV. (sidecar machines).—1, A. G. H. Alsford, Bournemouth (Clyno), 20s.; 2, R. C. Pearson, Portsmouth (Premier), 21s.; 3, W. H. Blackmore, Bournemouth (Calthorpe), 22½s.

## HANTS MOTOR CYCLE UNION (BOURNEMOUTH SECTION) HILL CLIMB.

Kiim (3½ New Hudson) starting. He unfortunately fell at the corner.

Tappenden (3½ Premier) going well. He obtained third place.

Flashlight Photograph of the start from the Town Hall, Sheffield, last Saturday evening of the Sheffield and Hallamshire M.C.C. Annual Reliability Trial to Holyhead and back, for the "Hutton" Shield.

#### Uxbridge C.C.

A meeting will be held at the Chequers Hotel to-morrow (the 12th inst.) at 8.30 p.m. with a view to forming a motor cycle section. All motor cyclists are welcome.

#### North Middlesex M.C.C.

A twelve hours' open reliability trial will be held on the 20th inst. for motor cycles, sidecars, and cyclecars. The route will be to Stratford-on-Avon and back. Arms Hill will be included in the course only for those who wish to make the ascent.

#### Pontefract M.C.

The annual twelve hours' reliability trial was held on July 4th over the following course. Pontefract, York, Garrowby, Scarborough, Whitby, Saltburn, Thirsk, Ripon, and Pontefract. The winner was H. Craven (Chater-Lea and sc.); F. Hiley (T.T. Triumph) was second.

#### Sheffield and Hallamshire M.C.C.

There was probably the biggest assembly of motor cyclists ever gathered together in Sheffield at the annual 320 mile trial to Holyhead and back. The route was *via* Millhouses, Buxton, Knutsford, Chester, Prestatyn, and Bangor. The following riders finished, the first four tying for first place: D. Bradbury (3½ Norton), F. Dover (3½ Premier), J. Haslam (6 Zenith and sc.), R. Garnett (6 Matchless-Jap), T. Durant (3½ Premier), H. Short (8 Chater-Lea and sc.), J. B. Nicholson (3½ Champion-Jap), F. H. Ronksley (3½ T.T. Rudge), S. Sawyer (3½ Premier), C. Halcombe (3½ Bradbury), and J. A. Stacey (6 Rex-Jap and sc.).

#### Birmingham M.C.C.

The third annual paperchase, organised by this club, was held on the 6th inst. On Saturday, the 20th inst., the open reliability trial for passenger motor cycles and cyclecars takes place. Full particulars can be obtained from Mr. R. Vernon C. Brook, Oakdene, Cambridge Road, King's Heath, Birmingham. Entries close on the 16th inst. A large entry is anticipated, as the course is a thoroughly sporting one, including, as it does, Edge Hill, Sunrising, Weston, Birdlip, Sudeley, Ilmington, and Saintbury.

The third annual reliability trial for the Sangster trophy will take place on the 13th and 14th inst., and take the form of a run to Aberystwyth and back. Route *via* Bromsgrove, Leominster, New Radnor, Rhayader, and Devil's Bridge.

#### Cork and District M.C.C.

A hill-climb was held on the 3rd inst. at Grange Hill. Results:

- I. Sidecars.—1, P. J. Cox (5 h.p. A.J.S.).
- II. Private Owners up to 500 c.c.—1, R. S. Russell (3½ h.p. T.T. Matchless), 45½s.; 2, M. J. Chambers (3½ h.p. T.T. Triumph), 49½s.

III. Unlimited on time and formula  $\frac{C \times T^2}{W}$  as recommended

by *The Motor Cycle*.—Formula order: 1, M. J. Chambers (3½ h.p. T.T. Triumph), 44½s.; 2, R. S. Russell (3½ h.p. T.T. Matchless), 45½s.; 3, P. A. Egan (3½ h.p. T.T. Bradbury), 43½s.; 4, L. Dobbin (8 h.p. Matchless), 39½s.

Start of the Birmingham M.C.C. Paperchase. The hon. sec., R. V. C. Brook, setting out; his passenger has the supply of paper.

# What the WAR OFFICE TIMES AND NAVAL REVIEW says about **THE HAZLEWOOD.**

"The ideal motor bicycle is THE HAZLEWOOD, and, in our opinion, superior to any other motor cycle in the world. It is extremely suitable for Military and Naval Officers, as a machine of the highest class for speed, power, and reliability."

## **COST OF UPKEEP.**

**This will interest you.**

10th June, 1912.  
Hotel Angiolo and Simphon, Milan.  
Messrs. Hazlewoods, Ltd., Coventry.  
Gentlemen,

I have just arrived at Milan after a most pleasant journey through France. I am glad to say that my Hazlewood machine behaved splendidly and I had not the slightest trouble, although I covered about 1,000 miles.

I find that the petrol consumption was very small. I found I could average 137½ to 150½ miles per gallon, and at this I was most astonished, especially as one part of my journey took me from Lanslebourg over the Mont Cenis to Milan.

I cannot speak too highly of the splendid reserve of power which I always had in hand when running my machine.

Yours faithfully,

R. G. BALMAIN.

For the convenience of tourists the size of the book has been made suitable for the pocket or valise.

## **Know your road before you start.**

**It will save much time and discomfort.**

"The Motor Cycle" Route Book contains carefully selected routes for the whole of the British Isles, with distances clearly shown; 45 Sectional Maps and Index Map (by Bartholomew), Speed Limits, and a copious index.

In every case the BEST route—and not necessarily the shortest—has been chosen. Large towns, congested districts, and bad roads are avoided.

**Before commencing a tour every motor cyclist should study this book carefully. He will be well repaid by the added enjoyment which comes of freedom from worry.**

**Price 1/6 net.**

**By Post 1/9.**

Obtainable from **ILIFFE & SONS LTD., 20, Tudor Street, LONDON, E.C.**

And from all Booksellers and Bookstalls.

(Remittance should accompany orders sent by post.)

## Club News.—

## South Wales A.C. and Cardiff M.C.

The entries close on the 10th inst. for the open hill-climb and speed trials, which will be held at Caerphilly and Porthcawl respectively, on the 18th and 20th inst. There will be classes for motor bicycles, sidecars, and cyclecars.

## Herefordshire M.C.C.

This club joined with the Newport Club on the 23rd ult. in an inter-club run, which took the form of a speed-judging and reliability contest. Result: Hereford M.C.C. lost 91½ marks; Newport M.C.C. lost 62½ marks.

## East Yorkshire M.C.C.

A new club has been formed for Hull and district with the above title. Its features are: No trade influence, affiliation with the A.C.U., limited membership and subscription fee of 10s. 6d., which will cover the period from now until the end of 1913. The hon. sec., Mr. T. H. Straker, 12, Percy Street, Hull, will be glad to send particulars of membership to anyone interested.

## Scarborough and District M.C.

On the 26th ult. a novel endurance contest was held on Sutton Bank, near Thirsk. The competitors had to make non-stop consecutive ascents of this famous hill with hot engines, only thirty seconds being allowed at each end for signing checker's book and turning round. First and winner of gold medal, G. H. Storey (3½ single-gear Norton), who made seventeen consecutive ascents and only retired then because he was the only competitor left running; second, S. H. Clay (3½ F.E. Triumph), eleven ascents; third, J. W. F. Tranmer (2½ Humber lightweight with three-speed Armstrong), eight ascents.

## Belfast and District M.C.

The above club held a petrol consumption trial on the 22nd ult. Results:

Rider and machine.	Total		Petrol	F.M.
	weight.	used.		
	lbs.	ozs.		
1. Hugh Denby (4 Rex) ...	382	42	909	
2. W. Rickerby (3½ Rudge) ...	366	60½	604	
3. Tom Mallon (2½ Premier) ...	346	59½	581	

## Hamilton and District M.C.C.

A hill-climb was held on the Louinsdale Hill, Kirkfieldbank, Lanark, on the 22nd ult.; also a flying half-mile two days later. Results:

## HILL-CLIMB.

Class I.: 1, Dr. Fotheringham (3½ Bradbury); 2, J. Bergman (3½ Rudge-Multi); 3, J. Low (3½ Rudge).

Class II.: 1, T. Gibson (8 Dot); 2, R. McA. Walker (5-6 A.J.S.).

Class III.: 1, A. L. Wilson (2½ Enfield); 2, W. Dick (2½ F.N.).

Sidecar Class: 1, R. McA. Walker (5-6 A.J.S.); 2, — Adams (3½ Zenith).

## FLYING HALF-MILE.

1, J. Bergman (3½ Rudge-Multi) 35½s.; 2, M. Garry (3½ Triumph), 37½s.; 3, J. Low (3½ Rudge), 38s. Fastest time of the day: 1, M. Garry (3½ T.T. Triumph), 33½s.

## Sheffield and Hallamshire M.C.C.

A hill-climb took place on the 29th ult. at Bradfield. Results:

## LIGHTWEIGHTS.

	Time.	Fig. of merit.
1. D. Bradbury (2½ New Hudson) ...	53s.	44.3
2. J. W. F. Tranmer (2½ Humber) ...	59½s.	63
3. J. Carter (2½ A.J.S.) ...	79s.	82

## STANDARD SINGLES.

1. N. Newton (3½ Rudge) ...	44½s.	55.6
2. D. Bradbury (3½ Norton) ...	47½s.	61.8
3. S. Swift (3½ Triumph) ...	48½s.	68.3

## MULTI-CYLINDER MACHINES.

1. R. Garnett (6 Matchless) ...	45½s.	85.7
2. W. Telfer (7 Indian) ...	50½s.	119

E. L. Moxey (8 h.p. Matchless) made fastest time.

An open hill-climb will be held near Sheffield on a very steep, perfectly safe hill, with excellent surface, on the 27th inst. There will be seven classes. Information can be obtained from Mr. D. Bradbury, 3, Fulmer Road, Sheffield.

## Essex M.C.

A gala day will be held at Brooklands on August 17th, when there will be motor cycle, sidecar, and car races, and a hill-climb on the test hill.

## Dublin and District M.C.C.

An examination of the checking sheets of the novices' trial to Maryborough and back, reported in the issue of the 27th ult., showed that there was a tie for first place, J. Livens (3½ Rudge), H. T. Carroll (3½ Singer), and W. J. Towell (3½ Rudge), each scoring the maximum number of marks (100). Seven of the other twelve finishers won bronze medals by scoring seventy per cent. of the maximum marks. In the re-run of the dead heat in the White cup, which was run off in connection with the trial, the two men Roche (3½ Rover) and Browne again tied.

## Cork and District M.C.C.

The following events were run off on Garryvoe Strand on the 26th ult.:

Event I. (sidecars): 1, C. G. Pohlmann (3½ Rudge), 10s. start; 2, L. Dobbin (8 Matchless), scratch.

Event II. (motor cycles under 500 c.c.): 1, M. J. Chambers (3½ T.T. Triumph); 2, R. S. Russell (3½ T.T. Matchless).

Event III. (four mile handicap): 1, L. Dobbin (8 Matchless), scratch; 2, M. J. Chambers (3½ T.T. Triumph).

A scratch race for sidecars resulted in a win for Pohlmann; Dobbin's belt broke.

## Chesterfield and District M.C.C.

There were over fifty entries for the Stanage Hill-climb on the 26th ult. Results:

Event I. Passenger Class.—Fastest time, J. S. Wilcockson, (7 h.p. Indian and sidecar), 53½s.

Event II. Unlimited c.c.—Fastest time: Twin-cylinder, F. B. Halford (8 h.p. Brough), 35½s.; single cylinder, J. J. Kelly (3½ h.p. Bradbury), 39½s.

Event III. Standard Singles in Pairs.—W. Woods (3½ h.p. Triumph), 44½s.

Event IV. T.T. in Pairs.—J. Farrow (3½ h.p. Triumph) 39½s.

J. Farrow (3½ h.p. T.T. Triumph) and J. J. Kelly (3½ h.p. T.T. Bradbury) then ran off for fastest time singles, and Kelly won, his time being 38½s; Farrow's 40½s.

A FULL LOAD.

Frank Smith's Clyno sidecar combination was very popular with the ladies on the "prom" at Douglas, and was always sure of a full load.

## QUESTIONS & REPLIES

SRJ

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Machine will Only Run Fast.

**Q.** My machine refuses to run slowly and constantly stops, but will run fast with the throttle open and the air closed. Will you please advise?—J.S.E.

**A.** We should advise you to take the carburettor down and carefully overhaul it; evidently there is a stoppage. The failure to run slowly may be due to a partial obstruction in the jet or elsewhere in the carburettor, or too much air due to the union not being air-tight.

### One Cylinder Misfires.

**Q.** I have a 2½ h.p. twin which has lately commenced to misfire in the front cylinder. I thought at first the plug was at fault, but find that a plug which sparks regularly in the back cylinder will not in the front. Can you explain this? Is it possible for the carburettor to be at fault? If so, is the getting at the choke tube (as fitted 1910) a difficult matter?—F.J.L.

**A.** It is possible that the magneto carbon is cracked, broken, or making poor contact. We should advise you to examine this. But it is more likely that the carburettor requires cleaning. In these carburettors one jet supplies each cylinder, so if one is choked the result is obvious. They are rather troublesome to dismantle and must be carefully reassembled.

### Oil Grooves.

**Q.** Which is the correct thing to do in building an engine, put the oil grooves on the crank pin or in the bush of the connecting rod? I may inform you that having had the connecting rod rebushed with white metal, and after a run of 100 miles with plenty of oil, it has all been ground out, possibly by the oil grooves in the crank pin. Your opinion on the subject will be looked for by a good many of your readers, as the idea here is that the engine has been constructed wrongly, and I have been advised to have a new crank pin made with no oil grooves in, but oil grooves in the bush.—E.V.

**A.** The answer to your question is that both methods are correct. Grinding should be impossible with spiral grooves properly cut, but if the groove is a straight one and on the side where the pressure is greatest, it might occur, especially if the edge is sharp. It is unusual to bush motor cycle connecting rods with white metal, phosphor-bronze is usual.

### A Holiday in the Isle of Man.

**Q.** I intend soon to go over to the Isle of Man for a holiday, and wish to take my motor cycle, 1912 Clyno and sidecar, with me, and I shall be glad of the following information: (1.) Before embarking at Liverpool must I empty my petrol tank? (2.) Do I require any special licence for touring in the island? (3.) Do the Isle of Man Steam Packet Company's men take charge of putting machine on board ship and unloading? (4.) About how much will the cost be to take the machine from Liverpool to Douglas and back?—O.W.

**A.** (1 and 2.) Yes, the petrol should be emptied from the machine before embarking. The steamer authorities, however, are not extremely strict. When you get to the I.O.M. you must call at the offices of the Highway Board in

Athol Street, and fill up a form. This is an act of courtesy; there is no charge for it. (3.) The I.O.M. Steam Packet Company's men and those employed at the Liverpool and Douglas docks see to the loading of the machine. (4.) A sidecar costs 5s. each way. Porters 6d. each.

### Building a Cyclecar.

**Q.** I am contemplating building a small three-wheeled cyclecar. (1.) Would a 2 h.p. motor cycle air-cooled engine be sufficient (weight of car and load thirty stones)? (2.) Are differential gears necessary for three-wheelers? (3.) What is the best material for frames?—L.P.J.

**A.** (1.) 2 h.p. is just about half the power you require. (2.) Differential gears are not necessary. (3.) Special cycle tube, which can be obtained from most large factors of parts and fittings.

### THE MOTOR CYCLE FOR ALL AGES.

Mr. James L. Norton, a well-known competitor in past T.T. races, was seen in the Island on a sidecar this year with his father as passenger. Mr. Norton, jun., is the maker of the machine bearing his name.

## Sidecar on Four-cylinder Machine.

?

As I intend purchasing a second-hand  $4\frac{1}{2}$  h.p. F.N. would you kindly answer the following questions regarding that mount:

(1.) What would the mileage per gallon be? (2.) Is the lubricating oil consumption great? (3.) Would the machine be able to take a sidecar over ordinary roads (20 stones load)? (4.) Is lack of oil the cause of engine seizure? (5.) As it is a fixed engine, what is the best method (and easiest) of starting with sidecar attached?—C.N.R.

(1.) The mileage per gallon would be about sixty or seventy. (2.) The consumption of lubricating oil would be rather greater than that of a twin-cylinder. (3.) The machine would take a sidecar over ordinary roads if a two-speed gear is fitted. (4.) Lack of oil would certainly cause seizure. (5.) We should advise you to have either the two-speed gear sold by this firm, or a free-engine clutch. Without it a sidecar would not be advisable.

## Stamford to Swansea.

?

I shall be glad if you can tell me the shortest and best route, avoiding large towns as much as possible, from Stamford (Lincs.) to Swansea (Glam.)?—S.E.R.

Your best route from Stamford to Swansea would be as follows: Through Rockingham Forest *via* Weldon, Corby, Market Harborough, then two miles after crossing the Leicester-Northampton Road, branch to the left and take the road through Rugby over Dunsmore Heath, through Leamington, Warwick, Stratford-on-Avon, Alcester, Evesham, Tewkesbury; then you can either go to Gloucester and follow the Severn estuary by Newnham, Chepstow, Newport, Cardiff, and Bridgend; or you can go *via* Ledbury, Ross, Monmouth, Raglan, Pontypool, and then follow the railway to Crumlin, Tredegar Junction, Rhymney Junction, Nelson, Aberdare, and Neath to Swansea. We are inclined to think that a combination of the two routes would give you the finest scenery, by going through Ledbury and Monmouth and then turning south to Chepstow along the Wye Valley and taking the coast road.

## Carburettor.

?

I have a 1911 Douglas a.o.i.v. On taking out air and throttle slides after running, I find both saturated with petrol, also petrol on walls and at bottom of air chamber. What is the cause of this, and does it account for carbon deposit forming so rapidly on piston and cylinder heads? I have to scrape deposit off every 500 miles. Inlet valves open  $\frac{1}{16}$  in., springs are strong, and petrol level is not too high. There is no leakage.—A.G.

You might try a rather smaller jet, and this should prevent the deposit forming quite so rapidly, also try reducing the amount of lubricating oil slightly. Also it is quite possible that, although the petrol level is not too high when the machine is standing, the excessive movement of the needle valve may yet allow an overflow when on the move. The needle valve should be able to rise high enough to allow an ample supply of petrol, but no more. Too rich a mixture will cause a deposit.

Latest model Roc tricycle, produced by A. W. Wall, Ltd.

## Various Queries.

?

(1.) Should the exhaust valve click much when the engine is being throttled down? This has only happened since my Easter tour. (2.) How can you prevent an acetylene lamp from going out when one rides fast? I might add I have spring forks and the light is put full on. (3.) What is the gradient of Wrotham Hill, in Kent? (4.) What is the best way to prevent a clutch from slipping?—G.R.F.W.

(1.) The click is probably due to excessive clearance between valve stem and tappet (there should be not more than  $\frac{1}{32}$  in. at the most) or to worn or badly cut gear teeth. The click in itself will do no harm. See that the gear wheel bearings are not too slack. (2.) A good acetylene lamp should not be perceptibly affected by the pace. We cannot answer this question without seeing the lamp. (3.) This is not a severe hill, the steepest part being about 1 in 10. (4.) If a disc clutch, clean out with paraffin and if

possible adjust spring. If this fails, new discs or spring may be necessary, though probably a thorough clean will put matters right. If a leather cone clutch, clean and scrape leather and dress with castor or collar oil.

## Sidecar for a Potterer.

C.

I am thinking of buying a motor cycle and sidecar, and shall feel obliged if you will give me your opinion on the matter. At present I do not know anything about motor cycles, but I want a machine so that my niece and self can jog along the country roads at a nice easy rate. I may say that I am getting on in years (nearly 60). (1.) Could I purchase a reliable second-hand machine and sidecar for about £30? (2.) What kind would you advise me to get? (3.) Is it difficult to understand? (4.) Could I read up the subject in any book? (5.) What is the cost of licence?—G.D.

(1.) £30 is not quite enough for a second-hand motor bicycle and sidecar. (2.) We should recommend a machine with engine not less than  $3\frac{1}{2}$  h.p. and fitted with a change-speed gear. (3-4.) If you purchase a copy of "Motor Cycles and How to Manage Them" you will be able to understand a motor bicycle easily. (5.) The driving licence costs 5s., registration 5s., and local taxation licence £1.

## EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles and accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.G.G." (Cambridge).—Bowden two-speed gear and free engine.

"J.G." (Glasgow).—1912  $3\frac{1}{2}$  h.p. Lincoln Elk (clutch model) for solo work.

"W.G.H." (London).—Watawata belt on 6 h.p. Zenith.

"H.B.A." (Folkestone).— $3\frac{1}{2}$  Rudge Multi and sidecar. Belt wear with  $\frac{1}{4}$  in. and lin. belts.

"D.N.R." (Glasgow).—Four-cylinder 1910 F.N. (single-gear) for use with sidecar, particularly as regards hill-climbing, tyre wear and petrol consumption.

THE DOUGLAS TEAM IN THE JUNIOR T.T.

From left to right the riders are: J. Haslam, J. Stewart, W. H. Bashall (winner), Rex Mundy, and S. L. Bailey. E. Kickham, second to finish.

**Carburettor Spraying Device.**

Petrol is supplied from the usual float chamber to a spraying device consisting of a pair of cones which are superposed and attached to a base C to form an annular chamber D in which the petrol finds its level. An air port E passes through the base C, and other air inlets F are arranged just above

the top cone. The ports F are opened and closed by the operation of a clevee G, which also carries a needle H for regulating the opening of the port E. With this also is combined the engine throttle J, with its control lever K. Small orifices are left at the upper end of the cylindrical port E, through

**A Neat Repair Outfit.**

The Leicester Rubber Company have sent us a very neat tyre repair outfit called the "John Bull." The box measures 3½ in. x 3½ in. x 1½ in., so that its title, "Compact," is a suitable one. This outfit is one of the neatest brought to our notice, and its contents are well selected.

**Racing Helmets.**

In response to our query respecting pneumatic helmets for racing purposes, Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W., write to say that they have made many such helmets and have several in hand at the present time. They prefer to make them to fit the head. These helmets can be relied upon to prevent concussion, as there is a space of one inch between the outer layer, which is of thick cork.

**Electrically Welded Petrol Tanks.**

It may not be generally known that the operation of welding petrol tanks is employed on some makes of motor cycles. The Enfield Cycle Co., Ltd., have devoted a considerable amount of time to perfecting their petrol tanks, and have now introduced an electric welding machine which welds the top joints.

**T.T. Winners' Selections.**

F. A. Applebee's winning T.T. Scott was equipped with Continental tyres, Bosch magneto, Renold chains, and Brooks saddle, whilst Pratt's spirit and Wakefield Castrol oil were used.

In the Junior Race the results proved the popularity and efficiency of the Amac carburettor, which was used on nine of the ten leading machines.

which the petrol is sprayed by the air drawn in through the ports L and F.—O. H. Austin, No. 19,759, 1911.

**A Balancing Device.**

In order to counteract the unbalanced effect produced in a single-cylinder engine the inventor proposes to use a bob-weight suspended in a bearing B on the top of the crank case C. This bob-

weight is oscillated by a pin D, and the direction of oscillation is such as to counteract the unbalanced movements of the engine.—W. E. Lilly, No. 277,071, 1911.

**Spring Handle-bar Mounting.**

The handle-bar A is mounted on a sleeve B carried by a pair of rocking links C bolted to a sleeve D, which passes into the steering head, the attachment

at E being such that the angle of the handle-bar can be varied. The links C carry rods F passing through lugs G on the sleeve and having springs H threaded upon them, allowing resilient movement between the parts.—J. T. Dallaway, No. 13,837, 1911.

**SPARKLETS.**

"Rudge Wrinkles" is the title of a booklet that has just been produced by Rudge-Whitworth, Ltd., Coventry. It gives excellent information on the tuning of engines, and the Rudge engine in particular. It is the intention of the firm to distribute "Rudge Wrinkles" among motor cyclists who enquire.

**Works Extensions.**

The Armstrong Co. are doubling their capacity, and a new building is to be erected at a cost of ten thousand pounds. Another ten thousand is to be spent in additional machinery. These extensions are necessary in view of the demand for the gear, which is fitted to many machines, and the big contracts which have already been secured for 1913.

INDIAN RIDERS IN THE SENIOR RACE.

Left to right: J. F. Sirett, A. H. Alexander, C. B. Franklin, and J. R. Alexander. The machines used were exactly the same as those ridden last year, with a reduced stroke.

# The "T.T." Ballad

## Winners of the Senior "T.T." 1911 and 1912.

*Tune—Ancient Song "Keep on doing it."*

*When Godfrey rode an Indian  
and tuned it up for flight,  
Some scalps were raised,  
and the Indian Braves  
sang round their fires that night.*

*Keep on doing it, keep on doing it,  
Keep on doing it each T.T.  
Keep on doing it, keep on doing it,  
Good old Indian's 1,2,3.*

*When Applebee his partner  
tuned up his British "Scott,"  
He said "O.G."  
just wait and see  
This scalping business stop.*

*Keep on doing it, keep on doing it,  
Keep on doing it each T.T.  
The old Firm's doing it,  
The straight Firm's doing it,  
Good old Scott and Applebee.*

*So shout hurrah for England,  
Three cheers for the trusty Scott,  
Hurrah for the 2 stroke engine,  
So cool when pace is hot.*

*We keep on doing it, keep on doing it,  
We keep on doing it each T.T.  
Keep on doing it, keep on doing it,  
Either Godfrey or Applebee.*

Godfrey & Applebee are now booking orders for 1913  
Scotts, and "keep on doing it." So don't delay if you  
want one as orders are taken in strict rotation.

TALFORD STREET, ASTON, BIRMINGHAM.**AMAC****They go fast—they last.**

Wood-Milnes have shown themselves unbeatable for that!

The speed capacity of "Wood-Milnes" has been proved repeatedly in the longest and severest road competitions of the season, including the Exeter, Gloucester, Edinburgh, Stratford-on-Avon, and Birmingham-Land's-End Runs.

As to durability—the fabric foundation of a "Wood-Milne" is up to car tyre standard. The canvas is woven from strong-fibred cotton, and there is an extra layer. Its quality of weave, its uniformity, and its perfect rubber-filled mesh make this fabric equal to any strain that road work can put upon it. The "Wood-Milne" Steel rubber tread prevents punctures, grips the road—helps the engine up hill—adds both to speed and lasting power.

**Wood-Milne****MOTOR CYCLE TYRE.**

Made in "Griprib," "Gripstnd," and Rubber Studded Patterns.

*The Wood-Milne Steelrubber belt is the only rubber belt that will not slip when wet.*

# PARSONS RAPID REPAIR KIT

## Punctures lose their terror

In the old patch and solution days, punctures were serious things. But since the introduction of the Parsons Rapid Repair Kit punctures have lost their terror. With a Parsons Rapid Repair Kit in your toolbag or pocket, the permanent mending of a puncture is only a matter of three or four minutes' easy work. You locate the puncture, take out about a foot of tube, punch the hole clean, insert a plug, and compress same with the special pliers supplied. That completes the job. And a puncture mended in this way is permanent—it can never leak, neither can the plug creep.

Write for  
descriptive  
booklet.

Complete Kit, which measures 7" x 4", and weighs 1 lb., contains piercing tool, stretcher, closing pliers, and 12 plugs. The cost is

# CORONET SIDE CARS

10 Models to select from. Write now for illustrated catalogue, showing full detailed specification of the World-Famed Coronet Sidecars. Strongest, lightest, and scientifically constructed by practical men.

CAN BE OBTAINED FROM ALL DEALERS.

Model 1. High-class Canoe-front Body, Cranked Axle, and other improvements, £6 6 0.

Model 4. Ornamental Cane Body, as illustration, or Close Reed Cane Body, £8 8s.

**CORONET DETACHABLE JOINTS** enable our sidecars to be detached in one minute.

We illustrate herewith the "Coronet" Quick-detachable joints, which are fitted to all our models. To detach is simply a matter of unscrewing nut about five threads. When attached, and nut screwed tight, the joint is solid and perfectly rigid, and does not rattle like some patent joints held in position by springs and pins that are liable to shake loose.

## MAGNETOS. MAGNETOS. MAGNETOS.

We have a large stock of the best makes from 5/6. Your old coil and acc. taken in exchange.

### 25/- ALLOWED

- T.T. Rudge, not done 300 miles; too fast for owner, only wants seeing: £42.—Jim Ireland, Atherstone. [X4952]
- JAMES (1912), new, 3-speed, Dunlop tyres, belt, take sidecar anywhere.—54, Raddleborn Rd., Bourville. [X5756]
- GREAT Scott! What about the T.T.?—1910 Scott, any trial, Palmers; bargain, £30.—Vickers, Dnnchurch. [X5846]
- 5 h.p. Twin Rex, 1909, 2-speed: £23.—Main, 36, Parade, Leamington. [X5697]
- 3 1/2 h.p. Excelsior, 1910, Mahon clutch, in good order and condition: 20 gns.—Main, 36, Parade, Leamington. [X5696]
- REX, 5-6h.p., Bosch, handle starting, accessories, perfect: £22, or exchange lower power.—47, Court Lane, Erdington. [X2178]
- HUMBER Lightweight, 2h.p., 1911, new condition, lamp, horn, and spares: £23.—551, Soho Rd., Handsworth, Birmingham. [X5762]
- ROVER, 1912, 3 1/2 h.p. free engine, perfectly new, not ridden; write at once for clearance stock-taking price.—Sturgess, Garage, Leicester. [X4818]
- ROVER, 1912, 3 1/2 h.p. Armstrong Triplex 3-speed gear, quite new, ridden few miles; at stock-taking price; cannot repeat.—Sturgess, Garage, Leicester. [X4819]
- HAZLEWOOD, 2 1/2 h.p., 1912, free engine, 3 speeds, perfectly new; very special price before stock-taking.—Sturgess, Garage, Leicester. [X4820]
- 1910 5 1/2 h.p. Twin Peugeot, single gear, £23; also Millford rigid sidecar, close white wicker, spring wheel, cost £19, take £16.—42, Spon St., Coventry. [X5558]
- CLYNOS, the sidecar machines; three latest 1912 models in stock for immediate delivery; trade supplied.—P. J. Evans, wholesale agent, Sparkhill, Birmingham. [X2219]
- LADY'S Hobart, 1911, 3-speed model, as new; £32, complete.—P. J. Evans, Sparkhill, Birmingham. [X2223]
- 3 1/2 h.p. Minerva, overhauled, engine re-bushed, new piston, cylinder re-bored, new belt, take sidecar: £12.—Morris, Rubber Merchant, Melton Mowbray. [X5892]
- SINGER, 2 1/2 h.p., 1912, standard, extras, ridden 300 miles, going in for sidecar, splendid hill-climber: £30, or nearest offer.—45, George St., Balsall Heath, Birmingham. [X5716]
- 5 h.p. Twin Rex, 1908, free engine, handle starting, Bosch mag., spring forks, very low riding position, splendid condition: £15, bargain.—A. Holland, Clarendon St., Coventry. [X5610]
- 2 1/2 h.p. Clyde, mag., B. and B., h.b.c., low, P. and H. lamp, generator, Shamrock belt, new spare Olmcher tyre; trial here; bargain, £9/10, offers.—F. Brookhouse, 6, Buller Rd., Leicester. [X2280]
- CHATER-LEA J.A.P., 3 1/2 h.p., free engine, Bosch mag., Druid spring forks, B. and B. lamp, generator, spare tube, etc., condition as new; bargain, £27/10.—923, The Motor Cycle Offices, Coventry. [X5764]
- £5/10.—Taken for debt; great bargain.—3 1/2 h.p. Whitley, recently overhauled and enamelled, low, fast, rebushed, new rings, new belt, new accumulator, heavy Dunlops, climb anything; trial here.—Zar-Mo Manufacturing Co., Sketcheley, Hinckley. [X5745]
- 1912 Rudge, T.T., also F.E. Zenith, Singers, immediate delivery: 1911 F.E. Singer, just overhauled by makers, £39; two 1911 Triumphs, standards, condition excellent, not ridden since March, being taken in exchange: £37 each.—Midland Cycle Co., Coalville, Leicester. [X5866]
- 3 1/2 h.p. 1909 Torpedo Minerva, Amac, h.b.c., accumulator, in splendid trim, £13; also 3 h.p. Fafnir, mag., B. and B., h.b.c., Palmer cords, in fine order, £12; exchange both for 2-speed sidecar combination; would ride 50 miles on either.—Patman, Dysart Rd., Grantham. [X2240]

## SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

INDIAN, 7h.p., 1912 model, deliver at once; Ariel, 3 1/2 h.p., T.T. model, in stock.—Coward, Wisbech. [X4875]

### The Cyclecar.

PROBABLY one of the most interesting topics of conversation among motor cyclists, particularly sidecarists, at the present time is that of the cyclecar. The motor bicycle and sidecar, although regarded at first as more or less makeshift device, has proved its worth and survived opposition from other types of motor cycle passenger carrying vehicle. A miniature motor car embodying all the advantages of a sidecar and none of its disadvantages has been the dream of the motor cyclist and the ambition of many motor cycle engineers and designers for years past.

Are these desires about to be realised? In other words, will the new type supplant the sidecar in popularity or only become another class of motor cycle passenger vehicle with a limited sale, and consequently high cost? Designers and builders of cyclecars appear to have followed two distinct lines in the production of vehicles of this class—those built on motor bicycle lines and those constructed as miniature replicas of motor cars.

On many of these machines stock parts originally designed for both motor cycles and cars have been used, and when this policy has been followed the result *ensemble* has usually been a most unhappy one. A cyclecar is to be a success it must be made throughout with parts specially designed for it, and it is rather a costly, although most necessary, feature of the future that a complete set of shop patterns be prepared. This and other works' processes can only be undertaken by firms with capital who are prepared to bear such costs as these over a large output, otherwise the price of the completed vehicle must be prohibitive.

There is no gigantic difficulty in making a motor car on small lines, omitting some of the refinements which are not absolutely essential to a vehicle of the cyclecar class, but the obstacles in the way of marketing it at a price which will bring it within the reach of motor cyclists are great. Only the largest and best-equipped firms in the motor cycle business can hope to make the cyclecar remunerative at the price they will be called upon to produce it, either by placing on the market a set of parts from which the assembler can build a machine or marketing a complete vehicle in sufficiently large quantities to enable the price to be kept low.

In our opinion there is no necessity for sidecar makers to worry themselves unduly regarding the immediate future, even if the cyclecar should take a sudden bound into popularity, as the handy sidecar will remain as a passenger-carrying adjunct to the motor bicycle for some time to come. Many will still prefer it to any form of four-wheeler because of its extra speed (particularly uphill), low cost of upkeep and reduced running expenses, initial lowness of price, and ease of storage.

The *jeunesse dorée* of the motor cycle world—they who always invest in the latest and best irrespective of cost—will be the cyclecar makers' customers for a year or so at any rate, but it will be some time before the cyclecar, fascinating as it may be, can oust the sidecar from its popular position. The cyclecar appeals strongly to the motor cyclist who as a sidecarist can afford to keep two machines, but the greatest feature of the sidecar is its easy detachability, enabling the owner to have the advantages of two machines in one. This will cause sidecars to die hard.

## PREPARING FOR THE SIX DAYS' TRIAL.

BY AN OLD COMPETITOR.

**I** DO NOT propose to travel over familiar ground, and describe how such basic details as engine, carburetter, and ignition should be tuned up. A rider who is *au fait* with these things needs no instruction from me, and the novice should send his machine to the factory, and personally see that the head tester tries it before return. I will only suggest that in all modern six days' trials genuine freak hills are now part of the daily menu; and therefore a carburetter which can puff out a good head of gas at low engine speeds, and a magneto timing which can give a real hot spark with the piston on dead centre, are absolute essentials. Big choke tubes and early timings should be reserved for Brooklands.

### Tyre Troubles.

The trouble most likely to rob the aspirant of his gold medal is spelt with a T—tyres! Hence I plump for the heaviest beaded-edge tyre obtainable, with a good thick non-skidding tread.

If it be fitted immediately before the trial, it should be attached and removed three or four times, till its beads grow supple, or else ridden 100 miles and then removed and replaced. A brand new cover may spoil the score sheet, by protracting the time lost over a puncture. Within the cover there should be an endless tube at the start, because endless tubes are less likely to give internal trouble than butts; there is no reason why the tube should be new; an unpunctured tube that has done 2,000 miles without a puncture is a proved article; a new tube may split.

### After Tyres, the Belt.

The majority of riders using *rational* covers get through six days without inflation; but should a puncture occur, the endless tube should be cut out, and a butt-ender inserted; never employ a type of butt-ender that has not been tested. One butt-ender may be buttoned round the handle-bar, and a second spare may be furled round the body under the waistcoat. The tyre repair kit is best carried in a separate bag, and should include a gaiter in case of emergencies.

After tyres the most probable cause of lost mark is the belt. If the route be severe, belt troubles are inevitable, since there is almost sure to be rain on some of the days. My own tip is to carry three belts. One is the "service" belt, always used when time permits, and it contains two adjustable fasteners. By the aid of these fasteners, and an adjustable pulley time need seldom be wasted in punching and drilling if the belt has to be cut, care is taken to cut off the oldest bolt-hole of the four.

The easy road out of Lynmouth (avoiding Countisbury Hill), leading from Oare Church to the main Porlock Road.

A second belt is carried looped round the tank ready for rapid substitution if the "service" belt gives trouble when time is pressing. It is cut to suit a medium gear, and has a plain hook fastener. The third belt is carried in a case, and is ready for virulent belt slip on rain-soaked mountains; it is cut to suit the lowest obtainable gear, and also has a hook fastener; some riders would use a well-stretched leather belt for this third belt, and, if so, they should carry a stick of Beltecum. The pulley flanges may be drilled all over, if of stout section: otherwise they should be drilled at the height of the lowest gear.

Control wires need attention, which they do not often receive. At the start of the Six Days, all control wires should be open to the full adjustment, and their

TOURING IN DEVON. View of the Coast Road from Hunters' Inn to Woody Bay. Observe the low wall at the side of the road, and the big drop into the valley.

nipples should be perfect; if the rules permit, a spare exhaust lifter wire, tested for fit, should be carried throughout—no breakage is more aggravating.

The magneto should be fully shielded, and sparking plug protectors are desirable.

A complete kit of spare valves and springs and cotters, all tested for fit, should be carried, and if the makers' valve cotters have a tendency to burr, special cotters of harder metal should be used, or the strength of the valve springs reduced.

A petrol filter is advisable, and some riders like gauze air screens, which prevent dust entering the

engine. Such screens should be cleansed whenever a chance occurs in dry weather, for if dust collect it will interfere with carburation.

Finally, the time schedule is the real crux of the trial, and consequently a reliable speedometer and two watches are needed; it is foolish to rely on a single watch, which may become erratic or stop altogether. The regulations should be carefully studied, and a half inch map of each day's route should be carried. You may lose your way just when time is most pressing, and the arrowman has had a breakdown.

AN UP TO DATE CONVERSION.

It is difficult to believe that the above side by side two-seater was originally an 8 h.p. twin-cylinder Rexette with tandem seats. It was "converted" by Mr. F. H. Hand, of Earlsdon, Coventry.

## NEW CYCLECAR HOUR RECORD.

## INCIDENTS OF THE NEW CYCLECAR HOUR RECORD.

The final touch-up before the start.

H. Ward (Bedelia) starting.

Putting out the fire after the eleventh lap, caused by the heat of the exhaust pipe.

ON Wednesday last week a Bedelia cyclecar, driven by H. Ward, regained the hour record previously held by the G.W.K. The record now stands at 45 miles 278 yards, or 388 yards better than the old record. Ward was lapping at 50 m.p.h. for six consecutive circuits, but speed fell off in the last six laps caused by a control wire fouling its protecting tube and preventing the ignition from being fully advanced. The lap speeds as given out by Mr. A. V. Ebbelwhite (timekeeper) were:

Lap.	Speed. m.p.h.	Lap.	Speed. m.p.h.	Lap.	Speed. m.p.h.
1	44.95	7	50.07	13	40.80
2	50.33	8	49.82	14	38.88
3	50.38	9	50.12	15	38.55
4	50.02	10	43.95	16	35.71
5	50.33	11	50.43	17	35.05
6	50.38	12	45.50		

The effect of the ignition trouble is very plainly seen in the lap table. Two attempts were made previous to the successful effort, as after running half an hour on the first attempt the driver threw out a blazing piece of floor cloth and then pulled up with smoke

rolling from the back of the machine. Sand and water were hastily obtained and the flames were extinguished after a few minutes, and before they had time to damage more than the wood side pieces, floor boards, and rear crosspiece. An exhaust pipe placed too close to the woodwork of the frame caused a conflagration which was quickly extinguished; thereafter the woodwork in the neighbourhood of the exhaust pipe was flooded with water and no further trouble occurred. The machine used had not been run in or tested on the track previous to the record. The 80 by 100 mm. 90° twin-cylinder engine was exactly similar to standard except that a Nilmelior magneto was fitted with a special contact maker designed to interrupt at the correct firing point to suit the angle of the cylinders. Minor alterations which had been embodied in the chassis design were a tubular torque rod between the engine crank case and the frame, thicker steel steering wires running in flexible metal casings, and an improved type of foot brake, which advances will be incorporated in further deliveries of Bedelia cyclecars which are sent over to England.

The Bedelia at full speed round one of the bends.

## OCCASIONAL COMMENTS.

By "IXION."

**A Cyclecar Tourist Trophy.**

Only one cyclecar—a grey streamline Rollo—was in evidence at Douglas during the Isle of Man races, but its presence caused many riders to remark that a cyclecar T.T. would be extraordinarily interesting. Suppose the fact of the matter is that at present there are not sufficient cyclecars made to justify a race, and many of their manufacturers are small firms, not well-endowed with capital, there would have been no chance for a race to fill.

With two or three exceptions cyclecars are rather in the experimental stage at present, but by next year or the year after they may have entered upon a major boom. They should develop faster than any previous type of motor vehicle has done, as the engine, the ignition, and the carburation were all untried problems at the advent of previous types; these are now successfully standardised, and it is only the chassis of the cyclecar which needs perfecting. Consequently a cyclecar T.T. will soon be required, the type is to be permanent, and it is conceivable that a race would fill in 1913. If the race were organised in good time, and the conditions settled before autumn, some of the more sporting and wealthy clubs might assist the experiment by designing and building special cyclecars, and putting up an experienced member to drive the vehicle. Some enthusiasts are clamouring for a sidecar T.T. I can only say I do not envy the passengers. Fancy occupying the rear of a sidecar in a T.T. race when the driver is being excited! At speed on corners sidecars are often readily overturned at the best of times, and accidents would be somewhat numerous.

**Buying a Racing Mount.**

It is the custom of the trade at present to send out their T.T. roadsters tuned for racing speeds. This implies three main items, viz., early timing of the ignition, special valve setting, and special carburettor setting.

The two first items are perfectly adaptable to ordinary work, but the special carburettor setting usually implies a certain difficulty in starting. The "choking" device is of large aperture, and the machine requires to be pushed off very energetically before an explosive mixture can be sucked out of the jet. Such setting is a nuisance in ordinary roadwork, especially when frequent stoppages are necessitated, and purchasers will do well to modify it by fitting a small orifice over the "bottom air" orifices. This enables the rider to get a fierce starting suction on the throttle, and yet to retain the free pull essential to really high speeds.

**Variable Gears.**

Once again variable gears emerged triumphantly from a fierce racing test. Gears have now vindicated themselves magnificently in two successive races, as well as in last year's Six Days, and when the Taunton Six Days are over, their position should be completely assured. In the old days we eschewed variable gears, because they increased the certainty of trouble; but now it is hardly too much to say that a first class gear is as reliable as a magneto or a carburettor. Apart

from this will the lessons of the T.T. Races shape the tendency of development in favour of the countershaft gear? Hub gears proved their reliability, but in the course of practice and racing we learnt two definite facts. The one is that extra weight is best situated in the centre of the wheelbase: a heavy back wheel does not enhance perfection of steering, either on grease or at high speeds over dry roads. The other is that small engine pulleys are not ideal, and that the two-step drive, embodying a 6in. or 8in. drum as the minimum, avoids belt troubles and prolongs belt-life.

**A Luggage Carrier Problem.**

What is the use of providing a strong carrier with plenty of space on it if any bag strapped thereto hits the unfortunate rider about the region of his back brace-buttons? After years of tribulation we have reached a point at which we can rely on receiving a strong and spacious carrier as an integral portion of any machine we order. But on many machines carrying a large bag means a mass of blue and black bruises on the small of one's back. I have been riding two machines fitted with very similar carriers. I put my Brooks kit bag on the one carrier, and never knew it was there, except in mounting, when I had to vault high. I put it on the other, and it ceaselessly nagged my vertebræ every mile I rode.

THE THEATRICAL GARDEN PARTY.

Consul, and his adopted daughter, Nancy (who appears to be shy of having her photograph taken), arrive by motor cycle and sidecar.

## THE FUTURE OF THE T.T. RACES

### SOME SUGGESTIONS.

By B. H. DAVIES.

**A**FTER a T.T. race regrets and gloatings are rife, and without doubt an immediate vote would command a huge majority for a repetition of the T.T. races. Towards winter the blood cools down a trifle, and it is difficult to awake private enthusiasm, whilst works managers are thinking more of undelivered material and angry customers than of defeating ancient rivals in a road race. As a consequence the fate of the T.T. often trembles in the balance as December comes round. History is tolerably certain to repeat itself, and by next Christmas it may once more be exceedingly doubtful whether there shall be a race in 1913.

The first question we must ask is

#### Are the Races worth while?

A famous constructor remarked to me in Douglas the other week, "You know I voted for continuing the races, although other makers voted for abstinence because they thought they could not beat us and one or two others. Why, we learnt 75% of what we know from T.T. experience, and if the others keep out of racing we shall stay on top indefinitely!" That was a manufacturer's private opinion, and the opinion, moreover, of a manufacturer whose special reputation has been won by reliability and by durability; his machines don't break down, and they don't wear out quickly. Or again, take points accessible to the general public. It is an obvious fact that the 1911 races once for all established variable gears as integral parts of a full roadster specification; that variable gears have increased the popularity of touring by 50%, and have multiplied sidcar sales by five. It is early days to say what will result from the 1912 races. Doubtless there will be many a subtle and secret modification of internal construction, new cam shapes, new valve timings, new valve sizes, and new metals applied to valves, etc. There will probably be fresh attention given to steering design and weight distribution; the diamond frame may possibly time its decline from last month, the combined belt-cum-chain drive should gradually acquire popularity. In short, the T.T. exercises a profound and all-pervading influence upon design and manufacture; and if this is so, whatever the trade think about it, private users will certainly vote to perpetuate an event which has brought many valuable benefits.

#### Racing and the Industry.

If it is agreed that the T.T. must be perpetuated, the question arises whether in its present form it satisfies the needs of the moment, or whether like the reliability trials, it requires stiffening up. The routes and regulations of all legal limit trials have been made vastly more stringent during the last two years, but the

T.T. race of 1912 was similar to that of 1911. It should be remembered that the present race is exact chiefly from a rider's point of view. It is not a very frightful undertaking regarded as a mechanical trial. A ride like Franklin's 300 miles on Brooklands takes far more out of a machine, though it requires a machine of rather different type (or tuning). The prevalence of variable gears has relieved the demand for a flexible engine within limits, cooling difficulties have been largely surmounted, brakes last out well. As a mechanical test the existing course is deficient in two main respects: it is very short (187 miles, as compared with Franklin's 300 miles), and it does not include a really steep hill.

Snafell would be contemptible were it not for the corners—there is no extremely severe grade from bottom to top. Thus any stiffening of the T.T. could only be obtained by lengthening the course, as a better hill-climb cannot be found nearer than the Alps, and as the riders could not be set to race over more than 200 miles at a stretch on two-wheelers, the first stiffening of the race must take the form of a two-day race with up to 200 miles racing each day.

#### The Financial Side of the Question.

Turning to the financial aspect, there is no doubt that the A.C.U. must face a loss on this year's race, though the loss will not be so great as one might expect, since expenses were economised.

The A.C.U. is now offering so many benefits for a 5s. subscription that its increased membership could not bring it a large balance to play with. If there is no trade bond next year a Manx race should be more remunerative. If many trade concerns once more

A SIGN OF THE TIMES.

## The Future of the T.T. Races.—

THE FIRST LADY MOTOR CYCLIST IN MANXLAND.

Miss Eileen Woods, daughter of Dr. Woods, and her 2 h.p. Moto-Reve.

abstain, the A.C.U. must count on more private entrants; and its obvious plan is to enquire into the cost of running off the 1913 T.T. in France, where sixty additional entries could easily be secured.

A French course would be considerably more convenient for most British spectators, and would tap the huge London district of a great army of petrol enthusiasts. The sole difficulty about a French course would be the inclusion of a real hill; police expenses might be greater, as a Continental crowd is comparatively uncontrollable.

The line of progress seems, therefore, to indicate a race over a longer distance, possibly in the island, if the trade compete; probably in France if the trade

are so short-sighted as to abstain, and this would in any case be a two-day race. The need for a prolonged race is not so urgent but that a 187 mile course would suffice in 1913, but by 1914 a two-day race will be inevitable if the lessons to be learnt are to touch the maximum. The order and number of the finishers in any previous race would probably have shown large variations if the race had been continued for a second day.

## The Second Day.

On the second day the precedent of the Grand Prix would be followed, and only those who finish within a time limit on the first day would be allowed to start. Moreover, it should be permissible for every rider to change both his tyres under strict observation. I regret this necessity, for tyres need development more than anything else we use, but in a race a rider's life may depend upon his front tyre, and for this reason we have no right to make a road race into a tyre test.

A FRENCH LADY AND HER ENGLISH MOUNT.

Malame Alderson, of Orpington, Kent, a new member of the Woolwich P. Umstead and District M.C. This French lady rides a 2½ h.p. two-speed, Douglas, and is very keen on competitions. She has won prizes at rinking and tennis, and finds her motor cycle invaluable in connection with sporting and social events.

## DEMONSTRATION OF A TWO-JET CARBURETTER.

Mr. H. D. Ashworth, who is representing Messrs. C. Binks, Ltd., recently demonstrated to us the capabilities of his firm's two-jet carburetter, fitted to a 3½ h.p. single-cylinder machine, and, although greatly handicapped by the traffic, gave an excellent proof of its flexibility, which was remarkably effective. The pick up was very rapid, while the slow speeds at which the engine could be run on the road were decidedly more extreme than the average. In fact, the writer calculated, by timing the beats, that at its slowest the engine (an inside flywheel type) was turning at only about 160 revolutions to the minute. There was another very valuable point, too, that was noticeable about the working of the Binks, and that was in suddenly opening the throttle to the full, it did not seem to upset the mixture.

THE MOTOR CYCLE IN THE TRANSVAAL.

A pioneer lady motor cyclist in South Africa mounted on a twin Forward

## QUESTIONS & REPLIES

S.S.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Leeds to Grimsby and Bangor.

**?** (1.) Would you kindly give me particulars of the best route to take from Leeds to Grimsby, starting from Leeds and avoiding the hilly districts, and also the mileage? (2.) Also the best route to Bangor in Wales, and the mileage starting from Leeds?—I.F.

(1.) Leeds, Hambleton, Selby, Howden, Newport, Welton, Hull (cross Humber to New Holland), Uleby, Laceby, to Grimsby (eighty-two miles). (2.) Leeds, Huddersfield, Marsden, Stalybridge, Stockport, Northwich, Chester, Hawarden, Rhuddlan, Abergelle, Conway, to Bangor. This route (about 160 miles) is hilly, but you cannot cross the Pennines without encountering hills. If you wish to avoid the ferry from Hull to New Holland you can go by Doncaster, Gainsborough, Market Rasen, Caistor to Grimsby, but this route is longer.

### A Trip to the Continent.

**?** A friend and I intend to take a short trip abroad this year. We wish to do from 800 to 1,000 miles, and shall spend about two weeks on the road. The only town we definitely wish to visit is Paris. Can you advise us of an interesting route with fairly good roads? We shall be glad to have any suggestions which you can make.—INDIAN.

We should advise you to join the Scottish A.C., or a club affiliated to it, which is in turn working in conjunction with the A.C.U. or A.A. and M.U. This will entitle you to apply to the Touring Department of either body, where every facility is given to those wishing to tour both in England and on the Continent. We should not advise you to visit Paris with your machine. What you had better do is to cross over from Newhaven to Dieppe, or Southampton to Havre, and run down the Valley of the Seine, from Dieppe to Rouen *via* Tôtes, or from Havre to Rouen *via* Caudebec, continuing through Rouen and Les Andelys. If you cross to Dieppe a good plan is to go to Pontoise; there leave your machine and go into Paris by train. From Pontoise there is a road encircling Paris from the south, going round Versailles, which allows you to see the Palace. There is a certain portion of bad road to be covered going round Paris, but not so much as going in and out of the city, where the roads are appalling, and the traffic very badly regulated.

### Hot Spark at Slow Speed.

**?** (1.) I have had my machine one year and ridden 4,000 miles, and now it does not start (by decompressor) as easily as when I first had it. It will fire at a sharp walking pace, but will not pick up when put in free engine. Originally it would pick up after firing twice. The decompressor itself is in perfect condition, and the machine runs splendidly. Could this be owing to the magneto not giving quite such a hot spark at slow speeds as when new? The points are properly adjusted, etc. (2.) I do most of the distance with sidecar, and get 1,400 miles out of a tin rubber belt. Is this what I must expect with the variable gear fitted to the machine? (3.) Do you recommend a rubber or leather belt for a gear of this type, which is naturally rather severe on the pulley and belt as regards slipping for starting, etc.?—H.E.C.

(1.) We should think it is quite possible that the magneto is not giving as good a spark as it was when new. You might try adjusting the sparking plug points a little closer. The mileage you are getting from the belt is not at all bad considering the nature of the gear. A rubber belt is best for this type of gear.

L. W. Learmount, of Penang, Straits Settlements, who is an enthusiastic rider of a 3½ h.p. Rudge. The owner tells us that he has no trouble to keep the engine cool even when riding "all out" mile after mile in a temperature of 150°. Incidentally, the picture shows the riding apparel of motor cyclists of the Straits Settlements.

### Newcastle-on-Tyne to King's Lynn.

**?** I am riding from Newcastle-on-Tyne to King's Lynn, Norfolk, next week-end—could you kindly give me the most direct route? I do not mind riding through big towns. Will there be any stiff hills, and in what condition are the roads, also what is the distance?—E.G.G.

Your best route would be as follows: Newcastle, Nevill's Cross, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Retford, Tuxford, Newark, Sleaford, Spalding, Long Sutton, to King's Lynn. There are hardly any hills worthy of the name on this route. The surface is good almost the whole way. The distance is approximately 220 miles.

### A Lightweight in Switzerland.

**?** I should be indeed obliged if you would kindly give me the benefit of your advice and experience in the following: I purpose taking a tour of some 1,600 miles roughly as follows: Boulogne, Paris, Geneva, Chamounix, Little and Great St. Bernard to Martigny, thence over Simplon to Domodossola, thence over St. Gothard, Grimsel, and Furka Passes to Interlaken, Zurich, Lucerne, over the Arlberg Pass to Innsbruck, Meran, over the Stelvio to Colico on Lake Como, thence over the Splügen Pass to Basle. This may seem a terrific programme, but I only weigh 9½ stones, and shall travel practically without luggage. I shall never travel more than 100 miles per diem on the level, and of course have some kind of variable gear. Taking this into account, I fancy a 2½ h.p. machine will suit me better than a 3½ h.p. one. What do you think? With reference to the passes mentioned above, none have a grade of more than 11%, and that only occasionally. All are traversed by diligences, and are regularly crossed by motor cars.—H.St.J.B.

With regard to your route. There is now a road from Chamounix to Martigny, but it is in a very bad state, and it is said that its condition is dangerous. Martigny is inaccessible over the Great St. Bernard, and motor cars are forbidden from the Swiss frontier on. You could easily do the journey on a 2½ h.p. change-speed, except that the pace would be somewhat slow travelling over the long straight roads in France to your destination.

to enjoy the tour at all and safely reach your destination, we should advise you to avoid Boulogne and Paris, and to travel *via* Newhaven and Dieppe, then through Rouen, Chartres, and Orleans, where the roads are very much better. Only those who have ridden in and out of Paris know what this means. We should strongly recommend you to consult the managers of the A.A. and the R.A.C. Touring Departments to which you are entitled if you are a member. A lightweight machine with a variable gear should suit you admirably.

#### Second-hand Machine for Beginner.

**Q.** I am trying to procure a good second-hand motor cycle. I can only afford about £15 15s. for a beginner's machine. Should I be better treated by a dealer or a private seller? Could I get a decent machine to last a year to learn upon for the amount mentioned?—H.H.

You can get a fair second-hand machine for about the price mentioned in your letter. As to whether you go to a dealer or a private owner does not matter very much, as often bargains can be picked up from either, but before purchasing the machine you should get an independent expert's opinion on it, so as to make quite sure that the machine is what it is represented to be.

#### Carburettor Adjustment.

**Q.** I should be much obliged if you could help me with regard to the following. I have a 1912 twin Fafnir 70×80 mm. (magneto) which I cannot get to run at all slowly. When in the low gear (10 to 1) or free engine, the engine races away at a very high speed (even when retarded). The carburettor is a 1908 pattern. The throttle control is extremely poor, and seems to have no effect at all on the speed. I may say the carburettor was recently fixed on a single-cylinder engine; perhaps it is not suitable for engine, or would a more recent make be advantageous?—LC 1811.

The trouble is probably due to bad carburettor adjustment. What you have to aim at is to get a strong mixture and little of it to run at slow speeds. Obviously you would get better results by fitting a modern carburettor.

#### Fulham to Wellington (Salop).

**Q.** Will you be good enough to forward me details of the best route from Fulham to Wellington, Salop, avoiding hills, and if possible quoting mileage?—

F.E.H.

Your best route would be as follows: Go straight over Putney Bridge, down Upper Richmond Road, and straight as you can go through Richmond, Twickenham, turning to the right across the River Crane at Fulwell Park, go straight on till you come to the Bath Road, then go through Colnbrook, Slough, Maidenhead, Henley, Nettlebed, Benson, Dorchester, Oxford, Woodstock, Chipping Norton, Moreton-in-the-Marsh, Evesham, Worcester, Kidderminster, Bridgnorth, Wellington. The distance is approximately 170 miles.

#### Camborne-Reading-Aberdeen.

**Q.** Could you inform me the best routes from Camborne to Reading, passing through Ashburton, and from Reading to Aberdeen, avoiding as many large towns as possible, but at the same time taking as little time over the journey? Please inform me where to look out for police traps?—A.McN.F.

Your best route would be as follows: Camborne, Redruth, Zelah, Mitchell, Bodmin, Liskeard, Callington, Two Bridges, Ashburton, Chudleigh, Exeter, Honiton, Chard, Ilchester, Ilminster, Edmonton, Hindon, Amesbury, Andover, Whitechurch, Kingsclere, Aldermaston, Reading. To Aberdeen: Reading, Marlow, High Wycombe, Amersham, Dunstable, Luton, Hitchin, Biggleswade, Eaton Socon, Buckden, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming Lane, which follow right to the end, then go through Bishops Waltham, Corbridge, joining the Carter Fell road beyond Otterburn, over Carter Fell to Jedburgh, Earlston, Lauder, Dalkeith, Edinburgh, Granton, by ferry to Burntisland, Kinross, Perth, Coupar Angus, Glamis, Forfar, Brechin, Stonehaven, to Aberdeen. You can, if you like, go from Burntisland to Kirkcaldy, then through Cupar, Newport, Dundee, Arbroath, Montrose, Stonehaven, to Aberdeen. We do not know of any police traps on the routes we have given.

#### Engine Noises when Running Light.

**Q.** I have a 1907 Triumph which is a simple, reliable, and entirely satisfactory machine, but the engine knocks when there is no pull, such as down hill or on the flat, a rattle which I ease by using the exhaust lever a little, when at the same time there is an increase of speed. The compression bears 14 stones on the pedal a few seconds. (1.) What requires to be done? (2.) Would it be better to send the engine by itself to Coventry or take the bicycle complete to a local engineer, and let it be repaired there?—UBIQUE.

The rattle, of course, may be due to a loose bearing. To find out if this is the case it would probably be necessary to take down the engine. We should think it would be advisable to send the engine complete to Coventry and let the makers overhaul it. Of course, the rattle may only be due to the noise of the valves, and we should recommend you to try and make certain of this point before going to the expense of having it sent away. The knock is likely to be more serious when it occurs with the engine running under load.

#### Overheating.

**Q.** I have a 1911  $3\frac{1}{2}$  h.p. free-engine Triumph motor cycle (purchased new), and wish to know if it is strong enough to take a sidecar? The combined weight of self and passenger would be about twenty-three stones. The gradients in this district are very slight, the steepest being, perhaps, 1 in 20, and only for short lengths of a furlong or so. If I can use a sidecar with the machine, how much should I lower the gear? For solo work, I use 4½ to 1 gear. If the gear is lowered to, say, 5 or 6 to 1, would it in any way be detrimental?—E.M.R. (Jhansi, India).

A Triumph should take a sidecar very satisfactorily on the gradients you mention. We should recommend you to lower the gear to about 5½ to 1. This should not cause overheating. The heat of the atmosphere makes some difference, but not as much as might be supposed. *e.g.*, Captain Scott's air-cooled motor sleigh had to be abandoned because it overheated in South Polar regions. On the other hand, some of our correspondents assert that their engines never overheat in hot countries (120° Fahr. in the shade, for instance).

#### EXPERIENCES WANTED.

"R.C.G." (Bridlington).—5.6 h.p. Bat, with and without sidecar.

"E.P.R." (Cowbridge).—Heron two-speed fitted to 3½ h.p. with chain drive and sidecar.

"Zenith" (Glasgow).—Decompressors on a big twin, particularly as regards ease of starting and slow running.

"Roc" (Rugby).—Puncture-proof bands.

If "Shone" (Hawarden) will comply with our rules his query will be dealt with.

AN IMPRESSION OF SPEED ON A TORONTO RACE TRACK.

The picture gives an idea of the immense crowd (the stand is packed) which witness the meet, the sharpness of the bends, and the extraordinary angle the riders assume in rounding the bends at speed. On these dirt tracks the dust is appalling and dangerous when several riders are competing together.

## A Trial of the Arden Cyclecar.

IT is some weeks since we described and illustrated the Arden cyclecar made by the Arden Motor Co.,

Berkswell, and now, thanks to the kindness of the manager, Mr. E. A. Isherwood, we are enabled to speak of its behaviour on the road. Before doing so we may mention one or two more or less important alterations since our first reference appeared. The petrol tank has been moved behind the dash, and is neatly located under the scuttle. Formerly it was in front of the dash and under the bonnet. The fan drive is also differently arranged. It will be remembered that a belt was used at first, but this broke occasionally and disappeared altogether. The drive is now by friction wheel, and proved to be efficient by the cool running of the 8 h.p. J.A.P. engine. The fan, it may be mentioned, is in front of the engine, the cylinders being set transversely. To form the friction wheel three discs of leather are clamped between metal plates, and bear on the periphery of the clutch drum, a spring helping to keep them in contact. A further amendment in design is the substitution of 28in. wheels for the 26in. fitted to the first model. Our trial was on the experimental cyclecar which has now run several thousand miles. Starting away, the top gear lever was engaged in about thirty yards, and there it remained for practically the whole of our trial, except after stopping.

We first steered for Stoneleigh, the Coventry test hill, and accelerating to about 30 m.p.h. at the hill foot, the little car ascended the 1 in 8 gradient on top gear without hesitation. The dozen or so testers we noticed in the shade of a huge oak tree, with all makes of machines, could really be forgiven for a smoke and chat that close afternoon. Continuing *via* Milverton and Warwick, and repeating the top gear run through the

centre of the latter town, which is no easy matter on account of the combination of narrow streets, traffic, and tramcars, we ran along the main road to Stratford-on-Avon. Changing places with the driver, we were impressed by the ease of steering, but for that matter we always had a high opinion of the wire and bobbin method on the 8 h.p. Rover for light cars. The vibration at the steering wheel was, however, rather discomforting. It disappears, we found, at faster speeds, but is always present at about legal limit pace. The bodywork and springing was quite comfortable, and should be better still after the substitution of

28in. wheels. The control is simplicity itself. The ordinary Amac air and throttle levers are clamped to the steering pillar, and with these alone one can throttle down to about 10 m.p.h. and accelerate to nearly 40 m.p.h. without a change of gear, but in our opinion the top ratio could be raised with improvement. Any machine is much more pleasant to drive with the engine turning over at a comfortable speed.

A long gradual rise known as Sherbourne Hill, the Arden simply revelled in. Satisfied with its hill-climbing we retraced our path, the good J.A.P. again making light of the gradient past the Leicester's Hospital, Warwick, and so on back to Coventry, *via* Gibbet Hill. Only once did we have occasion to use the change-speed lever;

it acts on a quadrant and was rather stiff in action, but details such as these have been amended on the standardised car. To sum up, the Arden is fast enough for all reasonable minded tourists. The gears and differential are practically silent, and if one may judge from a short trial, it is reliable and economical in running. Finally, the weatherproof shaft drive is a big point in its favour.

The first model of the Arden cyclecar.

Group of members of the Leicester & District M.C.C. who made a tour of inspection of the Singer Company's works last Thursday.

# LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

## Power for Sidecar Work.

Sir,—If you will allow me a few lines I can further endorse Mr. R. H. Adams's statement. On June 2nd I returned from Bristol to Manchester, a distance of 200 miles. This was done in the day with a standard  $3\frac{1}{2}$  h.p. single gear Sun and sidecar (gear  $4\frac{3}{4}$  to 1), my passenger being over 11 stones. We came without a single stop, except for the changing of a belt, as it poured with rain the whole of the way. This, I think, is a splendid performance for a  $3\frac{1}{2}$  h.p. machine, as the country is by no means flat. We had many a burst of 35 m.p.h., and the machine is still running well.

V. SUTTON.

## The Danger of Uncontrolled Dogs.

Sir,—I am very pleased to see this matter is being taken up by your correspondent, Mr. Wilks, and others. I have had several nasty spills caused by dogs charging me, and many narrow escapes. My experience is that the owners do not "care a rap" as long as the dog comes to no harm, and they very seldom make any effort to check them. I could supply a few names for the black list.

CHARLES F. BERRIDGE.

Sir,—With reference to letters on page 726 of *The Motor Cycle* on the danger of uncontrolled dogs, I received the other morning no less than fourteen complaints from your readers. The law requires that it shall be proved that the owner of the dog knows of its dangerous habits. On a dog being reported, full details are entered in the black list, a registered letter sent to the owner of the dog, and the police asked officially to warn the owner. Should the dog offend again, chances of success in "legal action" are fairly rosy. Full name and address of owner of dog and a description of the "bow-wow" should be sent. Under no circumstances is the name of the informer betrayed, but anonymous letters will be ignored.

L. C. WILKS.

(Gordon House, Woodford Road, South Woodford, Essex.

## Steel Pistons for Motor Cycle Engines.

Sir,—At the present time a large number of motor cyclists throughout the country are endeavouring to improve their machines in various ways in order that they may get faster and better results from them. As one who has had some, I am sending this letter to warn them not to spend their money on experimenting with steel pistons.

I had a couple made for my lightweight Humber, fully expecting that they would be considerably lighter than the standard Humber piston, which is, however, quite light, and to my surprise when they arrived they were only one ounce lighter than the standard piston, in addition to which they were extremely roughly finished, although they were very expensive. By dint of a lot of drilling, turning, and machining, I managed to lighten them considerably, but the weight so saved is so slight as not to warrant the expense for the very real and genuine risk of scoring the cylinders by the use of a steel piston.

I know of a case where a steel piston was fitted to a  $3\frac{1}{2}$  h.p. machine by an engineering expert who fully understands the properties of steel and the necessity for exceptionally easy and careful fitting, as well as ample lubrication. In his case, it has spoiled his cylinder, and he had to purchase another one, whilst, as in my case, the money laid out on the steel pistons is wasted.

I give these experiences in order to save motor cyclists their money as well as annoyance.

S. W. PHILPOTT.

## The 1913 T.T. Races.

Sir,—I think that the A.C.U. is to be congratulated on carrying through the T.T. Races this year in the face of much opposition. As a competitor, I can truthfully state that the organisation was perfect, and it will be a bad day for the English motor cycle when races are done away with. To strengthen the hands of the A.C.U., I have decided to enter for the T.T. Race next year, and if other riders would do the same, immediately, the A.C.U. could then set to work and frame the regulations.

In the course of conversation, a leading manufacturer stated to me that he would immediately set to work and prepare for next year's races. From this it seems that races will be held, and if they are to be a success every prospective rider should send his name in immediately to the A.C.U. and support it in its go-ahead policy.

IVAN B. HART-DAVIES.

## The Cost of Motor Cycles.

Sir,—With reference to the letter from Mr. Fitchett upon the above subject. Are there not a number of persons, who, thinking of paying from £20 to £25 for a motor cycle, would rather purchase a second-hand machine, with magneto, etc., than a new machine without the refinements of the present day motor cycle?

Nevertheless, I am sure there are many who would welcome such a machine as Mr. Fitchett suggests, especially as ignition by dry battery and coil is now so reliable. If Mr. Fitchett puts his idea into execution let us hope it will be in time for exhibition at this year's show.

I have before me a 1912 catalogue of a machine fitted with accumulator ignition, and minus spring forks, mudguards, stand, or carrier. This is sold (?) or offered to the public as a racing model, and the price is 36 guineas nett.

How, then, is Mr. Fitchett going to get his price down, even to £25, without sacrificing the essential parts of a touring mount?

I trust that more will be heard of this interesting subject, although it seems scarcely feasible to expect a reliable machine at half the price of the majority of present first-class machines.

LIONEL EVERSHED.

A novel decorated motor cycle and sidecar turn out at the Stroud carnival. The machine, as may be observed, is a B.S.A.

Sir,—Replying to Mr. W. J. Fitchett's recent letter, I am perfectly convinced that he would be courting disaster by fitting any other type of ignition except magneto, for I think it is pretty generally acknowledged that it is to the magneto, more than to any other source, that we owe the absolute reliability that petrol engines display to-day. Then again, as regards cheapness, I feel sure that, except for a slight difference in the initial cost, the magneto would prove much the more profitable investment, as it is both icksome and expensive to be compelled to buy new batteries every few hundred miles, besides having a feeling of uncertainty after they have been run for a time. No, sir, there are only two ways by which the motor cycle can be materially cheapened—firstly, absolute standardisation, and secondly, facilities and a market to turn them out in huge quantities, say 1,000 per week. Against these two essentials we have to place the inane faddiness of the average motor cyclist, and what is more lamentable still the fact that whereas every alien Tom, Dick, and Harry can dump his machines down here free of charge—nay, we even welcome them—the English manufacturer is fenced out of foreign markets on every side by a huge tariff wall, so high in many instances that the smaller firms fail to surmount them. At the present time England is by far the foremost country in the motor cycle industry, and everyone interested should do all in his power to keep her there, as it is one of the very few things in which she is first, but I know for a fact that there is a movement afoot in America for the turning out of motor cycles on the same principle as the cheap American car. Should this come about, the English manufacturer must look to his laurels. Mr. Fitchett is quite right in supposing that there is a demand for the £25 motor bicycle. I have no doubt that there is a huge demand. It is merely a question of whether we shall be sharp enough to supply the demand ourselves, or whether we shall wait for Cousin Jonathan from across the Atlantic to do it for us. I must remind you, sir, in conclusion, that already Americans hold nearly all the world's records.

FRED PEEL.

#### Motor Cycle Insurance.

Sir,—I have never yet taken up any of your valuable space in the correspondence columns, although I have been a motor cyclist since the very early days. I now feel, however, that I should like to give publicity to the very generous treatment I have just received from Mr. Priestley under the A.C.U. insurance policy. Although I have always been insured I have never had a claim until this year, when I joined Mr. Priestley's Co. Now, in less than six weeks, I have had two bad accidents, both costing Mr. Priestley's Company a good deal of money. Both claims were promptly admitted, and the repairs executed by the Service Company in less than a week, although the machine in each case had to be taken right down and new parts obtained from the makers and afterwards re-enamelled.

ALFRED R. ABBOTT.

#### Devonshire Roads.

Sir,—Having seen some correspondence in your columns lately on routes in Devon, and having just returned from a trip in North Devon, I think it might interest some of your readers to know that the main road from Bideford to South Molton is absolutely disgraceful, being so cut up by heavy lorries and traction engines as to render a journey over it a torture in fine weather and positively dangerous in wet weather. I intended to avoid this road on return by going over the Exmoor Road through Simonsbath, or by the Lynton-Minehead Road, but was informed by local garage owners that the moor roads were so rough as to be almost unrideable on motor bicycles, and that the Lynton-Minehead Roads, on account of a wet June, were very dangerous as the surface on the steep hills was extremely bad.

I might mention that North Devon motorists are so disgusted at the state of the roads that they are paying their licence and registration fees to other counties, and that on both my trips between Barnstaple and South Molton I saw only one motor cyclist, no cars at all, but I should think about a dozen heavy lorries or traction engines! The absence of motorists on the main road across North Devon speaks volumes in itself. The road between South Molton and Taunton is an improvement on the Bideford-South Molton portion, but requires care, as it is narrow and, in places

"pot-hole"; repairs, such as Noah might have carried out on the deluge-damaged roads, that is, pot-holes filled in with loose stones, the sharpest point upwards on top, make matters worse for any but a large shareholder in tyre companies. Local garage owners complain a lot of the absence of motorists. Is the Road Board unable or unwilling to rectify this and give "Glorious Devon" a chance?

#### BADLY BUMPED.

[The fault does not lie with the Road Board, which has, we believe, reserved £15,000 for Devonshire upon certain conditions with which the local authorities refuse to comply. —Ed.]

#### Tips for Douglas Riders.

Sir,—Perhaps the following tips may be of use to Douglas riders of 1911 machines:

- (1.) For easy starting, shut off most of the main air by fitting a piece of metal to slide over and cover a portion of the gauze-covered spoon-shaped air intake. This can be removed after starting. The tickler need not then be used.
- (2.) Place a rubber band on the magneto to hold the snap-on terminals in position, as after protracted use on bumpy roads they are liable to come off.
- (3.) When cleaning the back wheel on the stand, fasten exhaust lifter close up to the handle grip with a rubber band or piece of copper wire twisted.

Blackpool and Fylde M.C.C. Reliability Trial to Harrogate and back. The early arrivals at the turning point. (See Club News.)

(4.) The plug at the top of the crank case for paraffin swilling is very inaccessible and often needs the removal of carburetter, induction pipe, etc., to get at it. My plan is to wait till the lubricating oil chamber is empty, then put the requisite amount of paraffin in it and pump it into crank case. This plan needs nothing removed, and also keeps oil tank and oil pipe in clean condition.

(5.) After a few thousand miles have been covered, watch carefully the exhaust valve lift. The bell crank tappet ends have a hollow worn in them by the valve stem ends, and, recently, by the closest possible adjustment of the two ends when hot, I was able to put an extra ten miles an hour on the speed and to get up the steepest hills without pedalling. Previous to this close adjustment, the last third of the throttle lever opening was ineffective. Now, throttle opening right to the end produces acceleration.

(6.) If the tickler end of nozzle pin in float chamber ever gets stuck up, and the float chamber top refuses to unscrew, turn the petrol tap three-fifths off and run the machine without float chamber control of the petrol. I recently rode twenty miles like this without any discomfort.

I should be glad to read in your paper of other tips used by riders. Personally, they would be more interesting to me than accounts of minor hill-climbs. T. WINTERBOTTOM.

THE NEW MODEL

**A.S.L.**

with 26in. Wheels and  
Improved Frame.

## 'Riding on Air'

is literally true of the rider of the A.S.L. The air cushions or cylinders which are fitted to the front and back forks annihilate all vibration. Speed is increased; Comfort is assured; and the pastime is robbed of its greatest perils, viz. the physical danger arising from excessive vibration. No motor cyclist can afford to overlook the manifold advantages of the A.S.L., and should not hesitate to make it his choice. The booklet will prove A.S.L. advantages, a copy of which will be mailed free on request.

# WOLBROWN REGISTERED SIDECAR

The conveniently arranged cupboard fitted to the Wolbrown Sidecar.

### Look for the label

The unprecedented success of the "Wolbrown" (reg.) has brought the usual crop of imitations—mostly bad. Don't be misled, insist upon the genuine Wolbrown—the first sidecar body to be made in solid reed cane.

**A step forward which all manufacturers who want to keep their business must follow.**

**"WOLBROWN"  
REGISTERED.**

A Wolbrown registered label (as above) is attached to every sidecar we send out, and none is genuine without it. For your own protection—

**Look for the label.**

A SIDECAR you will be proud to possess—a carriage you can without diffidence ask your best friend to ride in—comfortable, convenient, and smart. It is designed on quite original lines, and possesses distinct advantages over the usual type. Roomy and practically weather-proof. No "sagging" of basketwork. No draughts. First on the market, made of solid reed cane, which gives great rigidity and strength, and does not wheeze like wicker or split cane.

Manufactured by... **W. H. BROWNLOW,**  
Portland Gate Works, Portland Crescent, Leeds.  
Behind The Coliseum. Telephone No. 223x Central, Leeds.

## FORWARD EJECTOR, the plug

Read this unsolicited testimonial. one of hundreds.

Dear Sirs,

It may interest you to know how the Ejector Plug, with which you supplied me shortly before Easter, has behaved. I used this Plug for a week's practising on Brooklands, then in the Short Race on Easter Monday. Since then it has done about 3,000 miles, partly on the free engine Triumph used in the race, and the rest on the back cylinder of my twin N.S.U. which was previously rather addicted to sooting up. Not once, however, have I had a stoppage for plug sooting, and this, I think, speaks well for the design of the plug, as I am a firm believer in generous lubrication for a small low geared twin. Congratulating you on your success in once again obtaining 3rd place in the Junior T.T., I remain, Yours faithfully, K. VAUGHAN.

P.S.—You are at liberty to use this if you so wish.

Aldersgate Street,  
LONDON, E.C.

**FOR  
SIDECAR  
WORK.**

26" x 2 1/4 in., per cover 52/6.

**A Couple of Hints.**

Sir,—The following hints may be of some use to your readers:

Eisemann magnets. There is a spring stop like a little spanner to prevent the central contact breaker bolt turning round. If this stop is pressed inwards, it allows the hexagon to revolve when unscrewing the spring stop to one side.

Cleaning platinum points. Very good tools for this job are the little sandpaper boards which are sold by chemists for trimming one's finger nails. If it is not convenient to detach the contact breaker, they are thin enough to go between the points. As they are made in different grades of fineness, it is possible to use a coarse grade for grinding out the black pitted marks, and then obtain a very highly polished surface with one of the finer grades.

POINTICURE.

**A Sidecar Picnic.**

Sir,—I am venturing to enclose a photographic print of a sidecar picnic I took part in this month. All, save two people and my hosts who invited me to join the gathering, were strangers to me, and it was not until a roadside halt occurred near our destination that it was noticed that all, save one pair (riders of a Bat-Jap), were mounted upon  $3\frac{1}{2}$  h.p. two-speed Humbers, and all were members of the A.A. Considering the event somewhat unique, is my excuse for inflicting my handiwork upon you, but I am aware of your interest in the pastime as well as the sport of motor cycling, and I think my snap-shot shows, not only the popularity of the Humber and the A.A., but that sidecaring for married folk is also A1.

W. HAROLD GOODENOUGH.

**The Over Zealous Policeman.**

Sir,—Owners of A.C. Sociables and similar tricars may be interested in an experience I had recently. I was driving my A.C. from London to Heathfield during the early hours of the morning. My machine suddenly stopped for want of petrol. I got out to fill it, and a policeman came up, and on going round the car informed me my rear light was out. The machine was standing still when he came up. I showed him my oil reservoir was full, and plenty of wick, and informed him that I had inspected the lamp eight miles back, when it was alight. He pointed out that the wick was charred, and said that as I had come over some bumpy roads it had evidently been jerked out. I was surprised to receive a summons to appear at Uckfield Police Court for driving a motor car without a lamp illuminating my back number. After the constable (P.C. Morris, of Nutley) had given his evidence, on being asked by me he denied mentioning anything about the charring of the wick. I then contended that the machine was not a car, but a tricycle, and by the law was not required to have a back light, and also quoted the case of the R.A.C. appeal, *Printz v. Sewell*, the decision of which is, "That if the lamp which illuminates the number plate accidentally goes out owing to no fault or neglect on the part of the motorist no conviction can be recorded." The Bench upheld me, and the case was dismissed.

It seems that the policeman is a youngster only too eager to get some sort of case.

R. JONES.

**Some Old Memories.**

Sir,—I notice in your issue for July 4th a query re Birdlip. This brings back old memories. Seven years ago I took delivery of the first Quadrant  $3\frac{1}{2}$  h.p. motor cycle, engine No. 3,001. The first ride I had on this machine was up Rowinham Hill, accompanied by Messrs. Silver and Harrison, of Quadrant's Bristol depot. The machine roared over the hill at such a pace that I had to cut out to round the halfway corner. I should think the pace was about 35 m.p.h.

A few days after, when I had altered the choke and jet in the Longuemare carburetter, and raised the gear to

$3\frac{1}{2}$  to 1, I tackled Constitution Hill, and was successful first time. When I told Silver, he would not believe me until he saw it done. Speaking from memory, I should say the gradient was 1 in 4 and the length 600 yards. This hill had to be taken at a very low speed at the bottom, owing to the bad surface and nasty bend. The hill itself had no surface; in fact, it was more like a river bed than a road.

A month after that I tackled Birdlip, and ascended this hill first time, using the same gear of  $3\frac{1}{2}$  to 1. I have also taken a trailer with a 9 stone passenger over Dinmore Hill without any trouble.

On this machine I covered over 10,000 miles in twelve months, and never had any trouble with it. I attribute my success largely to the fact that I kept the machine clean and looked after the valves regularly.

ANODE.

**Short Measure in Petrol.**

Sir,—Like a great number of your readers, I started about the middle of last summer to check my petrol consumption, and soon noticed that the two gallon cans did not contain

A SIDECAR PICNIC. All the machines save one are  $3\frac{1}{2}$  h.p. two-speed Humbers, and all the owners members of the A.A.

that measure. Right up to the present time I have not had a single can containing two gallons. They are usually about a pint short, and in one instance the can only yielded a short seven quarts. I was told at the garage that the cans are just as they receive them.

Now that we are paying more for petrol I think we should at least be guaranteed measure, and I should be glad to hear through *The Motor Cycle* if any other readers have noticed the same deficiency. The seals in each case did not appear to have been disturbed, and I do not stick to one brand of petrol.

FAIRNESS.

**Another Road Danger.**

Sir,—May I trespass on your valuable space to draw attention to the great danger to which motor cyclists are exposed at night by cattle and horses wandering on to the roads from the adjoining common and forest lands on which they are allowed to graze. Last Sunday night, in a dark country road in Epping Forest, I suffered a severe collision with one of these trespassers in the shape of a stray horse standing "broadside on" across the road, having come there from the common land close by. Although I had a good lamp and was not travelling fast, the animal loomed out of the darkness before I could possibly avoid it, the results being disastrous to my machine, though fortunately I escaped serious injury myself. Cannot something possibly be done to protect motorists against this unlooked for nocturnal danger? Why should it be lawful for owners, although they may turn their animals on to common by day, to allow them to wander at will by night.

OSCAR H. CORBLE

# A SEVERE ONE-DAY TRIAL.

Coventry and Warwickshire Motor Club's 182 Miles Trial for Manville Trophy.

ONE of the hardest tests for motor cycles crammed into a day event was the Coventry Club's contest last Saturday. The course was much the same as that used on May 4th in the open trial, when only nine of fifty-four starters claimed non-stop runs. Two further ascents were included in the more recent event, viz., Edge Hill and Sunrising, which, together with Ilmington, Campden, Saintbury, Birdlip, Sudeley, Guiting Grange, Weston-sub-Edge, all steep acclivities boasting gradients of about 1 in 6, provided a sporting test. The Coventry Club Committee have long adhered to the practice of selecting a really difficult course to determine the winners in preference to split seconds timing, which proves little or nothing of the capabilities of the motor cycle. There were thirty-two competitors, including a number of leading riders, the entries being divided into twenty motor bicycles—four of these lightweights—six sidecars, and five cars. The start was 8 a.m., rain falling at the time. All hills were observed, but there was little need for an official on Edge Hill, as every competitor made a clean ascent. At Stratford, Reg Hollaway who was mounted on a  $3\frac{1}{2}$  h.p. three-speed Premier and sidecar, was obliged to withdraw, as he discovered a fracture in the frame. He had made a splendid ascent of Edge Hill. All got up Ilmington, though Harold Williamson (Calcott) retired at this point with magneto trouble. The first secret check was on Saintbury Hill, and as a number of competitors had stopped to cool their engines at the hill foot, they were considerably out in the timing. C. T. Lloyd (Rex) was nearest with only three seconds error. Nearing Stow-on-the-Wold, G. E. Cuffe (7 h.p. Indian and sc.) stopped for a puncture in the sidecar tyre. Undaunted, he strapped the cushion on the carrier, left the sidecar at a wayside cottage, and continued with his passenger. From Guiting Grange to Winchcombe the competitors were taken over grass grown roads, only just rideable, which the Coventry Club term the colonial test. Hereabouts S. Wright (Humber) punctured, but effected a lightning repair. Down Sudeley, the latest Cotswold terror, then Cleeve Hill, through Cheltenham to Cross Hands and Birdlip. In the corresponding trial last year only eight competitors got up Birdlip, but on Saturday only two stopped. These were Alec Walsgrove (Hazelwood), whose overalls suddenly caught fire and caused him to divert his attention from the control levers to beating out the fire, and W. H. Carson (Excelsior sidecar), who got to the top knuckle before his engine finally gave out. The competitors arrived very punctually at the Queen's Hotel, Cheltenham, where lunch was taken, after a morning's run of ninety-eight miles. At half distance the three leaders were: C. T. Lloyd (Rex), total error 21 $\frac{3}{4}$ s.; A. N. Barrett ( $3\frac{1}{2}$  Rudge), 30s.; and H. D. Teage (Clyno), 30 $\frac{1}{2}$ s. A feature of the trial run was the wonderfully regular running, trouble being comparatively non-existent.

The homeward course was over the same ground as the outward run but omitting the Birdlip section. A sharp shower had rendered the surface of Cleeve Hill tacky, and a number were brought down to low gears. We passed V. A. Holroyd (Rudge multi) adjusting his belt, and later he suffered a puncture, so retired.

## The Steepest Test Hill.

Few dare attempt Sudeley on the run with hot engines, but all made clean ascents excepting Carson and Walsgrove. The hill has several deep ruts and the surface was moist and holding, and it was regarded as the most difficult climb of the lot. Only three single-gear machines were in the trial. These included W. F. Newsome's Triumph, C. F. Newsome's Rover, and W. F. Wartnaby's W.D. The last mentioned machine, which possesses the desirable feature of forced lubrication to all bearings, made a most creditable debut. The twin Humbers, ridden by S. Wright and G. Smith, were the lowest powered machines to climb all the hills, and both easily accounted for Sudeley. J. F. Spencer's performance on the big single-cylinder Excelsior sidecar is also worthy of a word of praise. He ran most consistently throughout, and no hill proved too much for him. Guiting Grange was climbed by all, and after Stow-on-the-Wold, Weston-sub-Edge followed. Unfortunately, K. A. Bennett (Rover) and B. Yates (Humber) went off the route in this neighbourhood and missed Weston altogether. E. A. Gorton (Rex sidette) was the only one to come to a standstill, and that was owing to a broken belt—hard luck indeed, as up to that point he was leader of the sidecar class. The second secret check proved to be a mile outside Stratford, and timekeeper D. K. Hall caught most of the motor cyclists ahead of time. A small crowd of motorists assembled at Sunrising, the last test hill, but this ascent did not trouble the competitors after what they had gone through. The run home was *via* Kington, Wellesbourne, and Warwick, only D. Elson (Rex) failing to put in an appearance before the timekeeper left.

The complete results are given hereunder. The system of marking was—a stop on a hill entailed a loss of five marks, and for every minute early or late after the first minute a mark was deducted:

## WINNER OF MANVILLE TROPHY.

Rider and machine	Total error.
-------------------	--------------

H. Nelson Smith (25 h.p. Hillman car) ...	2m. 9 $\frac{1}{2}$ s.
---	------------------------

## BEST PERFORMANCE BY A PRIVATE OWNER.

Cars.—Gilbert Spicer (Loreley).

Motor Cycles.—C. T. Lloyd (6 h.p. Rex sidette).

## MOTOR CYCLE CLASS.

- |   |                         |
|---|-------------------------|
| 1. W. F. Newsome ( $3\frac{1}{2}$ h.p. Triumph) ... | 3m. 13s.                |
| 2. J. H. Pountney ( $3\frac{1}{2}$ h.p. Rover) ...  | 3m. 40 $\frac{1}{2}$ s. |

(1). C. T. Lloyd (6 h.p. twin two-speed Rex) on Birdlip Hill.

(2). J. F. Spencer (Excelsior Sidecar) who won the sidecar prize, making a good ascent of Birdlip.

(3). G. E. Cuffe (7 h.p. Indian) on the corner on Birdlip. He left his sidecar at a wayside cottage and mounted his passenger on the carrier.

**A Severe One-day Trial —**

**BEST PERFORMANCE ON A LIGHTWEIGHT**  
S. Wright (2½ h.p. Humber).

**BEST PERFORMANCE ON A SIDECAR.**

J. F. Spencer (4½ h.p. Excelsior).

Souvenirs are awarded to the following, who completed the course with a loss of not more than ten marks.

**MOTOR BICYCLES.**

*W. G. Blatch (3½ h.p. Rudge) ...	Non-stop
A. N. Barrett (3½ h.p. Rudge) ...	"
P. Moss (3½ h.p. Premier) ...	"
*G. Smith (2½ h.p. Humber) ...	"
W. F. Wartnaby (3½ h.p. W.D.) ...	"
L. A. Bees (3½ h.p. L.M.C.) ...	"
*H. D. Teage (5 h.p. Clyno) ...	"
*C. T. Lloyd (6 h.p. Rex) ...	"
W. E. Roots (3½ h.p. Singer) ...	"
C. T. Newsome (3½ h.p. Rover) ...	"

**SIDECARS.**

\*E. Gorton (6 h.p. Rex) ... Belt broke Weston Hill

**CARS.**

Gilbert Spicer (12 h.p. Lorchley) ... Non-stop.

E. W. Cheshire (12-14 h.p. Wolseley) ...

\*Private owners.

The under-mentioned made non-stop runs, but ran off the course: K. A. Bennett (3½ h.p. Rover) and Bert Yates (3½ h.p. Humber).

The assistant hon. sec., Mr. Ambrose Elson, ably organised the event.

**SPANISH ROAD RACE.**

A motor cycle road race was held on the 29th and 30th ult., the course on the first day being Irun to Bilbao *via* San Sebastian and Vittoria, distance 124 miles. The second day the return journey to Irun was made by another route, distance 95 miles. Big crowds assembled in the towns along the route, the number of spectators at San Sebastian being estimated at 10,000. The first six places were all gained by Spanish riders mounted on Rudge machines.

## Leicester Club Members at the Singer Works.

ON Thursday afternoon last some forty members and friends of the Leicester and District M.C.C. accepted an invitation of Messrs. Singer and Co., Ltd., Coventry, to visit the works and make a tour of inspection. Commencing with the frame building department, the members were escorted through the different shops and the various processes through which the hundred and one parts of a motor cycle are passed briefly explained by the guides, Messrs. W. E. Bullock (works manager), G. H. Mansell (sales manager), and C. Pole (traveller). Everyone must have been impressed by the great activity which prevails in the Singer works, though it is an open secret that the company have had a record year, and at the time of the visit had actually turned out 1,500 motor cycles since the Olympia Show. In the grinding shop a group of members of the Leicester Club were much interested in the operation of finishing a connecting rod; one member who had watched with open-mouthed interest a grinder sending a shower of sparks in a perfect line, picked up the rod for examination. The hasty manner in which he dropped it reminded one of the Irish boy who caught a wasp thinking it was a pretty fly, and threw it down exclaiming, "My, his feet were hot!"

**An Experimental Cyclecar.**

The engine assembling shop commanded the most attention. Here the members saw engines being timed like clockwork, and other delicate operations performed with precision. A specially light T.T. piston drilled like a lantern came in for a good deal of attention; it scaled 14 ozs. In the erecting shop an experimental cyclecar with two standard 3½ h.p. engines in front, and to which we vaguely referred recently, held up the party for some time. It is illustrated on this page merely as a matter of interest to show how up-to-date makers must keep abreast of the times. The Singer Co. have gained a good deal of useful knowledge from this experimental four-wheeler, but it will not be offered for sale. After the

tour of inspection the party was entertained to tea in the board room, and subsequently returned home after a most interesting and instructive afternoon.

The experimental Singer cyclecar with double engines. It will not be marketed.

## A.C.U. SIX DAYS' TRIAL ENTRIES.

It is to be hoped that a record entry will be received for the above trial, to be held from August 12th to 17th, as it will undoubtedly be the most severe of its kind which has ever been held. Taunton will be the centre, and the routes will include the most difficult ascents to be found in the West Country. The new system of marking which prohibits competitors being more than ten minutes in advance of or behind schedule time at any point without loss of marks should make it a difficult matter for machines to come through with a clean sheet. Twenty-two machines have already been entered. The entry list closes on July 29th. The Auto Cycle Union will be glad to receive offers of assistance from any motor cyclists or local repairers willing to assist in directing the competitors upon the correct routes or to undertake checking the competitors where required. A tyre and belt trial will also be held in conjunction with the Six Days' Trial.

The following is a complete list of entries for the Six Days' Trials up to date:

**MOTOR BICYCLES.**

Rover Co. (3½ Rover)	P. Shaw (3½ P. and M.)
Rover Co. (3½ Rover)	S. H. Drake (3½ P. and M.)
Rover Co. (3½ Rover)	W. J. M. Sproule (3½ P. and M.)
G. T. Gray (3½ Rudge)	J. F. Sirett (7 Indian)
A. N. Barrett (3½ Rudge)	B. Alan Hill (7 Indian)
C. L. Scott (3½ Rudge)	A. H. Alexander (7 Indian)
W. Cooper (3½ Bradbury)	F. C. Wasley
A. Raymond Penney (2½ A.J.S.)	G. B. Fry
W. Pratt (3½ P. and M.)	A. G. Barr

Bristol  
M.C.C. Team

**PASSENGER MACHINES.**

J. R. Haswell (3½ Triumph sc.)

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

July 18th	...	9.6	p.m.
" 20th	...	9.4	"
" 22nd	...	9.2	"
" 24th	...	8.59	"

## "The Motor Cycle" Index.

The index for the six months ended June 27th is now ready. Subscribers will receive it free on application, non-subscribers can obtain copies, price 6d. each, on application to *The Motor Cycle*, 20, Tudor Street, E.C.

## Stolen Machines.

A 1912 B.S.A. free engine model, registered No. LE2825, engine No. 1904, with all accessories, including lamp and two generators, was stolen on Thursday evening, the 4th inst., about 10.30, from outside the "Duke of York," Potters Bar. The owner, Mr. Samuel Landy, 151, Grosvenor Road, Canonbury, N., is offering a reward of £5 for information which will lead to its recovery.

## Accident to H. Collier, Senior.

We regret to report that in the early hours of Friday morning last, a car containing Mr. H. Collier, sen., and a mechanic, overturned at the junction of the Bromley and Beckenham Roads at Southend village. Both occupants were pinned under the vehicle, and some little time after they were released Mr. Collier was found to be rather severely hurt and was taken to the Lewisham Infirmary, where he is progressing favourably. The car had to swerve to avoid a large cart, which, it is said, had no rear light.

## A.C.U. Notes.

**R.A.C. AND A.C.U. RACE MEETING.**—The annual inter-club meeting and gala day of the associated clubs will be held at Brooklands on Saturday, July 27th.

**THE A.C.U. MEMBERSHIP.**—The returns to the end of last month show that the membership is, approximately, 9,000, a very satisfactory increase from this time last year.

**SILENCER TRIALS.**—It is expected that the preliminary tests in connection with the silencer trials which the Auto Cycle Union proposed to hold will take place shortly. The experimental silencers have now been fitted to standard  $3\frac{1}{2}$  h.p. Triumph and Rudge machines respectively. These will be ridden before the judges and adjusted until they are satisfied that the noise made by the machines will be such as to cause no annoyance or inconvenience to other users of the highway. The results of the preliminary tests will be communicated to the various manufacturers and those specialising in the manufacture of silencers, and the Auto Cycle Union will then be prepared to accept entries for the open trial, which will be held in about six or eight weeks' time.

## French Hill-climb.

In the Val-Suzon (Dijon) hill-climb, held on the 7th inst., there were numerous classes for motor cycles. Cuzean (on a Terrot) won Classes B and E; Guignet (Motosacoche) Class F; Pean (Peugeot) Classes C and G; and Gabriel (Triumph) Class H. The fastest time was accomplished by Pean on a Peugeot—2m. 54s.

## Hill-climbs and the Surrey Police.

Organisers of hill-climbs would do well to obtain written permission from the police authorities before the contest takes place, as the following will show: C. W. Meredith was fined 20s. and costs for riding up Pebble Hill at an estimated speed of over 35 m.p.h. The hon. secretary stated that he had permission, but was unable to show anything in writing. W. I. Stratin was fined 30s. and costs for a similar offence after the competition was over. He seemed to be acting in a spirit of bravado.

## A Warning.

The inhabitants of Ruabon are pressing for a speed limit in consequence of the inconsiderate driving of many motor cyclists who, especially on Sundays, cause great annoyance by riding at an excessive pace through the town and with their cut-outs open. There are four churches along the main road, so it can easily be understood that noisy machines disturb many people. It is riders of this class that bring the motor cycle into disrepute.

## SPECIAL FEATURES.

### CYCLECARS.

## PREPARING FOR THE SIX DAYS' TRIALS. IRISH END-TO-END TRIAL.

## Mont Ventoux Hill-climb.

There will be four classes for motor cycles in the above hill-climb, which will take place on August 10th and 11th. Class I., 500 c.c.; Class II., 350 c.c.; Class III., 250 c.c.; Class IV., sidecars and tricars carrying two passengers. The event always attracts a big and important entry. The entrance fee for motor cycles is £2 each machine, and should be sent to reach l'Automobile Club Vauchusien, 9, Place Crillon, Avignon, France, on or before Friday, the 9th August.

## Marseilles Race Meeting.

The Marseilles Auto Cycle Club held a race meeting on the 1st inst. with the following results:

- Class I. (250 c.c.) Laurent (Alcyon).
- Class II. (300 c.c.) Sain (Alcyon).
- Class III. (twins) Arnaud (Peugeot).
- Class IV. (500 c.c.) Perrin (Peugeot).
- Class V. (650 c.c., twins) Hurstel (N.S.U.).
- Class VI. (twins over 650 c.c.) Chabaud (Peugeot).
- Class VII. (variable gears) Perrin (N.S.U.).

First prize in general classification, Perrin (Peugeot); Auto Cycle Club Cup, Arnaud (Peugeot).

ANNUAL WELSH RUN OF THE BIRMINGHAM M.C.C.  
A group of competitors at the surprise check, who arrived with sealed watches in hand.

**The Cyclecar.**

A persistent rumour was circulated last week-end that the Ford Co., of America, were about to build a large quantity of cyclecars for the British market to sell at about £60. We asked the firm if there was any truth in the report, and their reply, received by wire, was most emphatic. It read: "No! No! No!"

**Cyclecar Trial Abandoned.**

For the second time the Birmingham M.C.C. have had to cancel their open cyclecar trial. Saturday, the 20th inst., was the day fixed, but only two entries were forthcoming, so the committee decided to abandon the event. The hon. sec., Mr. Brook, gives as the reason for the scarcity of entries the severe nature of the course.

**German Motor Cyclists.**

As on previous occasions the place of meeting of the Allgemeine Deutsche Automobil Club constituted a rally for motor cyclists and light car owners. Nearly forty motor cyclists entered. The winners of the classes were as follows: Lightweights, C. Muller (1½ N.S.U.). Under 500 c.c., A. Boldt (3 N.S.U.). Over 500 c.c., K. Gassert (6 N.S.U.).

**Next Year's T.T.**

Next year's Tourist Trophy Races promise to be more interesting and instructive than ever if the recommendations of the Auto Cycle Union Competitions Committee be adopted. It is suggested that the races occupy two days, Friday, June 6th, and Monday, June 9th. On each day the junior machines would be required to cover four laps of the Snaefell course, and the Senior machines five laps. In the interval the machines would be kept under lock and key. No changes are recommended in regard to the cubical capacity limits, viz., 350 c.c. for Junior machines and 500 c.c. for Senior machines, and no handicap is suggested for the two-stroke motors.

**British Imports and Exports.**

From the following table, the value of the imports and exports of motor cycles for the periods of one and six months ended June 30th may be seen at a glance:

**IMPORTS.**

For month ended June 30th.

	1910.	1911.	1912.
Motor cycles ...	£6,389	£5,973	£3,803
Parts thereof ...	4,615	4,144	14,886
<b>Total ...</b>	<b>£11,004</b>	<b>£10,117</b>	<b>£18,689</b>

For six months ended June 30th.

Motor cycles ...	£26,974	£28,528	£24,828
Parts thereof ...	28,344	33,413	57,292
<b>Total ...</b>	<b>£55,318</b>	<b>£61,941</b>	<b>£82,120</b>

**EXPORTS.**

For month ended June 30th.

Motor cycles ...	£7,859	£13,408	£23,115
Parts thereof ...	3,569	3,731	9,878
<b>Total ...</b>	<b>£11,428</b>	<b>£17,139</b>	<b>£32,993</b>

For six months ended June 30th.

Motor cycles ...	£44,019	£95,878	£195,311
Parts thereof ...	19,006	30,393	74,187
<b>Total ...</b>	<b>£63,025</b>	<b>£126,271</b>	<b>£269,498</b>

**A.A. and M.U. Membership.**

The membership of the A.A. and M.U. now totals 48,620.

**Six Days' Record.**

Last week J. Guzwel, of Cleethorpes, riding a Rudge-Multi, claims to have regained the six days' record from W. J. Clark, of Doncaster. Guzwel reports having ridden 3,080 miles, beating Clark's performance by seventy-two miles. The route followed lay principally in the Midlands and East Anglia.

**Police Traps.**

It is reported that there is a police trap at Godstone just past the station bridge. This is worked two or three nights a week and nearly every Sunday.

What appears to be a new police trap is working in Bounds Green Road. Wood Green, N. The trap commences quite close to Jolly Butchers' Hill and extends for 220 yards.

FUTURE EVENTS	
July 18 & 20.—South Wales A.C. and Cardiff M.C. Open Hill Climb at Caerphilly.	
18.—Taunton & District M.C.C. Open Hill Climb.	
20.—B.M.C.R.C. Race Meeting.	
20.—Liverpool A.C.C. Open Speed Trials.	
27.—R.A.C. Associates' Gala Day at Brooklands.	
27.—Oxford M.C.C. Open Speed Trials.	
Aug. 2.—Bristol B.&M.C. Open 24 Hours Trial to Land's End and back.	
3.—Cumberland C.M.C.C. Open Speed Trials.	

**French Competition Notes.**

Prizes to the value of over £100 are to be awarded in the M.C.F. Grand Prix on August 25th, particulars of which were announced last week. The Circuit de Trets is the title of a 200 kilometre contest organised by Le M.C. de Marseilles to be run on August 4th. There are classes for 300 c.c. and under, 400 c.c. 500 c.c., and over 500 c.c. Entries should be sent to the Secretary, Marseilles M.C., 14, Cours Belsunce, Marseilles.

**Grand Prix de France.**

The above event, of which we gave details last week, is to take place on Sunday, August 25th, over a course of 450 kilometres. We hear of three British motor cyclists who will take part, including S. L. Bailey (Douglas) and Ivan B. Hart-Davies (Triumph).

**Snowden Climbed.**

On Saturday last, L. W. Spencer, of Uxbridge, riding a three-speed Rover, succeeded in climbing Snowden. Mr. Spencer will be remembered as the writer of the article in our Summer Number, "A Week-end Exploring Exmoor."

**A.C.U. Six Days' Trials.**

New features to be introduced into the regulations of the Six Days' Trials in the West Country are slow climbs of two test hills, in each case over a measured mile. Competitors will be expected to keep below 10 m.p.h. For every ten seconds or part of ten seconds in excess of this speed, a mark will be deducted. A special prize is offered in each class for the best performance. One of the test hills suggested is Countisbury.

Those competitors having machines capable of climbing Lynton Hill, Lynmouth, and Beggars' Roost, may receive a bonus of twenty-five marks for each ascent, though it has been decided that no competitor will have marks deducted if he be unsuccessful in the attempt.

**Roman Roads.**

A special committee of the Roads Improvement Association is now investigating the whole system of the old Roman roads in this country to decide whether, in view of the facilities now afforded by the Imperial Road Improvement Fund, any action can usefully be taken to bring any of the roads, now disused, into service again. The stability and thoroughness of construction of the old Roman roads are well known, but during the railway era a number of them became obsolete. It has frequently been suggested that, now that traffic is rapidly returning to the roads, many of the old Roman highways, which have excellent foundations, might be made up and utilised for cross-country traffic.

A newly-designed 6 h.p. Rex which is being standardised. Miss Hind took delivery of the first model a week ago, and rode it in the Irish End-to-end trial last Monday. She has also entered it for the Scottish Trials which commence on Monday next.

# THE IRISH END-TO-END TRIAL.

Forty-one Competitors in the Annual Trial for the Palmer Trophy.

**T**HIS year the entry of forty-one was a record one. About twenty-five competitors arrived at Goleen, some three miles from the start, on Saturday afternoon and evening. Frank Smith (Clyno sidecar) did not arrive till eight o'clock on Sunday evening. For the first time a lady motor cyclist in the person of Miss Muriel Hind entered for this severe test of both rider and machine. She was mounted on a new design 6 h.p. Rex. Soon after midnight on Sunday the competitors left Goleen for the starting point (which they left at one o'clock), and unlike the usual English trial all competitors were started together, some getting away at the word "go," others waiting back till the dust had somewhat abated.

Below is a complete list of starters:

J. Stewart (3½ Triumph)	W. J. O'Callaghan (3½ Zenith Gradua)
J. Lavery (3½ Ariel)	P. J. Brady (3½ Rudge)
P. Phillips (2½ Douglas)	L. Dobbin, jun. (8 Matchless)
E. Clark (2½ Douglas)	S. S. Sloane (3½ Rudge)
W. J. Chambers (3½ B.S.A.)	F. Short (3½ Humber)
F. C. North (3½ Ariel)	W. J. Towell (3½ Rudge)
J. R. Thompson (3½ B.S.A.)	R. Walshe (3½ Calthorpe)
H. Gibson (3½ Bradbury)	G. Roche (3½ Rover)
Miss Muriel Hind (6 Rex)	T. Greer (5 Rex)
R. Lord (6 Rex)	C. Kirk (3½ Triumph)
J. Clarke (3½ Rudge)	W. Parker (3½ Humber)
P. H. Hulse (3½ Rudge)	W. Dowse (3½ Zenith Gradua)
P. Beattie (3½ Rudge)	W. Kirk (5 Indian)
F. Smith (6 Clyno)	W. J. Burney (2½ Enfield)
W. F. Adams (3½ B.S.A.)	D. Gray (3½ James)
C. E. Murphy (3½ Triumph)	H. P. Mooney (—)
R. S. Russell (3½ Matchless)	T. J. Woods (3½ Ariel)
H. Greaves (2½ Enfield)	Rex Mundy (2½ Douglas)
W. Humphreys (3½ Humber)	M. Shields (3½ Humber)
S. Ruddell (3½ Bradbury)	
J. Levins (3½ Rudge)	
T. E. Greene (3½ Rudge)	

Promptly at 1 a.m. the competitors were despatched on the journey north by the chief coastguard from the coastguard station at Mizenhead. The first 28 miles of the course to Skibbereen is undoubtedly the worst portion, being extremely bumpy, twisty, and stony; This had to be traversed in the dark. The first man to experience trouble was North, who punctured some two miles from the start. Later his rear cover unfor-

W. Parker (3½ h.p. two-speed Humber) preparing to leave Dublin for the completion of the Irish End-to-end.

tunately came off six times. On reaching Dublin he bought a new cover, but found he was two and a quarter hours behind time, so he retired from the trial and enjoyed a fast ride to the finish. Near Dunmanway, 44 miles from the start, we passed Dobbin, who had collided with a stray donkey in the dark and knocked it over, of course coming down himself. Russell also hit the same donkey with his footrests without, however, falling off. The first check was held at Cork, where sandwiches and coffee could be obtained, thence the route lay to Dublin with checks at Michelstown, Cashel, Maryborough, and Dublin. At Dublin one hour was allowed for unch. Miss Hind said she was troubled with her wrists owing to vibration from the rough roads. Considering the loose state of the surface in most places very little tyre trouble was experi-

F. Short (3½ h.p. Humber) at the Dublin control.

W. J. Chambers (3½ h.p. B.S.A.) leaving the garage at Dublin

## The Irish End-to-End Trial.—

Competitors in the End-to-end trial passing over Inchicore Bridge.

enced, though we passed Lavery on two occasions with his rear tube out.

After lunch the competitors proceeded through Drogheda, Dundalk, Banbridge, Co. Antrim, and thence to the finish at Fairhead, some three miles from

## BIRMINGHAM CLUB'S TWO-DAY TRIAL.

The Birmingham Motor Cycle Club held their annual trial for the Sangster trophy last week-end over a course from Birmingham to Aberystwyth and back. A secret check was arranged both on the outward and homeward run, and many of the competitors ran very close to their twenty-mile schedule. The following checked in at the finish: A. D. Arter (3½ James and sc.), T. Pollock (3½ James), W. H. Egginton (3½ New Hudson and sc.), B. Bourke (3½ New Hudson and sc.), K. Clarke (3½ Corah), B. Ball (3½ Triumph), R. N. Corah (3½ Corah twin), S. Smith (3½ Norton), R. W. Duke (3½ Zenith), F. T. Hill (3½ Zenith), F. C. Sangster (3½ Ariel), W. H. Edwards (3½ New Hudson and sc.), H. G. Blackwell (6 Zenith), P. J. Taylor (2½ Veloce), W. E. Baylis (3½ New Hudson), S. A. Rowlandson (3½ Rudge), N. Newey (2½ Levis), V. Underhill (3½ Monarch), A. Webster (Hobart), E. T. Blumfield (3½ water-cooled Blumfield), and V. Busby (Humber).

## ANOTHER ACCIDENT DUE TO ABSENCE OF A REAR LIGHT.

We deeply regret to record a fatal accident to Cyril Bailey, hon. secretary of the Leicester and District M.C.C., and a member of the Coventry and Warwickshire M.C., which occurred on Saturday evening last. Mr. Bailey was returning from Barrow-on-Soar at about 10 p.m. on his motor cycle and sidecar, and when descending Birstall Hill, ran into the rear of an unlighted trolley car. The sidecar was overturned, pinning the unfortunate driver underneath. He sustained a fractured skull and died in a few minutes. His lady passenger luckily escaped with a shaking.

This accident again draws attention to the urgent necessity for all vehicles—and especially those of the slow moving type—to exhibit a rear light after dark. It would be difficult to say how many lives could have been saved if only this simple provision were included in all byelaws. Years ago, the Coventry Club started an active campaign to render rear warning lights compulsory on all vehicles, and thousands of signatures were obtained in its favour.

Later the Royal Automobile Club took up the campaign, but still without general success. It is shameful to think that fatal accidents are constantly occurring, due to the absence of warning lights, and yet the authorities refuse to heed continued appeals on the matter.

At the inquest, the Coroner, Mr. E. G. B. Fowler, drew attention to the subject, and we are glad to say that the jury returned a verdict of accidental death, the foreman saying "they considered rear lights to be indispensable for

Ballycastle, which the first man was due to reach at 9.42 p.m. During the latter part of the journey a very great deal of dust was encountered, which made it far from comfortable. Eight miles from Moira, Rex Mundy ran over a dog, unfortunately killing it and breaking his oil pump, he was obliged to stop every few miles and fill the crank case from an oil gun.

Hugh Gibson finished five minutes late, but explained that he had run short of petrol. The committee will consider this in company with Rex Mundy's application, the latter arriving at the finish four minutes early, being under the impression that the trial terminated at Ballycastle. C. E. Murphy rode a Triumph with three-speed Sturmey-Archer gear and Triumph decompressor.

All watches were placed in a sealed cardboard box in which a circular hole was cut for examination of the dial. Each man was therefore timed by his own watch, an idea first adopted by the Bradford Club. Great difficulty was experienced by the timekeepers at the checks, as all competitors being despatched together caused a great number, sometimes a dozen or more, to arrive at a check at the same time. We would suggest in future that the competitors be started at one minute intervals.

## IRISH TRIAL RESULTS.

The results of the above trial, subject to confirmation, are:

## GOLD MEDALS.

J. Stewart (3½ Triumph)	C. E. Murphy (3½ Triumph)
J. Lavery (3½ Ariel)	R. S. Russell (3½ Matchless)
P. Phillips (2½ Douglas)	H. Greaves (2½ Enfield)
Miss Hind (6 Rex)	T. E. Greene (3½ Rudge)
R. Lord (6 Rex)	L. Dobbin (8 Matchless)
W. F. Adams (3½ B.S.A.)	S. S. Sloane (3½ Rudge)
W. J. Chambers (3½ B.S.A.)	W. J. Towell (3½ Rudge)
E. Clark (2½ Douglas)	C. Kirk (3½ Triumph)
J. R. Thompson (3½ B.S.A.)	T. J. Woods (3½ Ariel)

## SILVER MEDALS.

W. Humphreys (3½ Humber)	G. Roche (3½ Rover)
P. J. Brady (3½ Rudge)	T. Greer (5 Rex)
F. Short (3½ Humber)	M. Shiels (3½ Humber)
R. Walshe (3½ Calthorpe)	

safe traffic, in the country perhaps more than the town. All vehicles ought to carry rear lights."

The Coroner: "I am very pleased to hear you say so."

Dan Bradbury (3½ h.p. Norton), hon. sec. of the Sheffield and Hallamshire M.C.C.

## Motor Cycle Racing at Brooklands.

**A**LTHOUGH there was only one race for motor cycles in the programme of the B.A.R.C. meeting on Saturday last, yet that one was of a particularly exciting nature from the spectators' point of view. Moreover, the weather was such as to make a pleasant afternoon under the Brooklands pines one of the most enjoyable ways of spending one's time.

There was a large entry, of which no fewer than eight were Rudges. A certain number of entrants were obviously from the amateur class, and it is to be hoped that of the many motor cyclists who are capable, a further number will realise that racing at Brooklands has much to teach an enthusiastic rider.

The authorities are to be congratulated on the erection of an additional tier on the press stand, so making the view from it one of the best to be obtained from any part of the track. The starters were as follows:

**THE TENTH SHORT MOTOR CYCLE RACE.**—Distance, about  $5\frac{1}{2}$  miles.

	Handicap, m. s.
R. L. Prince (2-cyl. Bat, 748 c.c.)	scr.
K. Yano (2 Bat, 658 c.c.)	6
P. Newbold (2 Zenith, 771 c.c.)	6
H. Jepson (1 Zenith, 488 c.c.)	18
H. Martin (1 Martin, 339 c.c.)	26
F. H. Hannis (1 J.A.P., 493 c.c.)	26
"A. E. Pontin" (1 Rudge, 499 c.c.)	36
Scott Aitken (1 Rudge, 499 c.c.)	36
S. Day Timson (1 Rudge, 499 c.c.)	36
Basil Collier (1 Rudge, 499 c.c.)	36
A. G. Walker (1 Rudge, 499 c.c.)	36
B. C. Remington (1 Rudge, 499 c.c.)	36
L. L'E. Edwards (1 Rudge, 499 c.c.)	36
A. G. Fenn (2 Humber, 359 c.c.)	36
E. B. Ware (2 Zenith, 494 c.c.)	36
J. A. Manners-Smith (1 Triumph, 499 c.c.)	36
G. E. Stanley (1 Singer, 294 c.c.)	48
C. Pressland (1 Rudge, 499 c.c.)	48
J. Cocker (1 Singer, 294 c.c.)	1 0
D. R. O'Donovan (1 Singer, 294 c.c.)	1 0
H. H. Square (1 Minerva, 258 c.c.)	2 30

Looking round the machines before the start, it was apparent that many were trying various devices in the hope of getting some additional efficiency from their engines. Pressland's Rudge had a big extra air pipe curiously contrived out of bent sheet copper and rubber tape. "Pontin's" Rudge had a large copper pipe leading from the timing case near the magneto to the extra air pipe.

presumably in order to get an injector action above the jet. A similar device, but with a rubber tube and a different general arrangement, was on Hannis's J.A.P. Basil Collier's Rudge had a Bowden wire and spring-controlled oil pump adaptation.

At the start the field bunched together well, the Minerva leading on its starting allowance, but travelling slowly. The first circuit saw the Minerva still ahead, with Stanley (Singer) hard behind and Cocker (Singer) pressing him close. Walker (Rudge) had come up to sixth place, while Timson (Rudge) was also well up.

### The Result.

At the finish Ware (Zenith) got well home an easy first and passed the post looking round and wobbling badly.

Handicap.  
SECS.

1. E. B. Ware (2-cyl. Zenith-Gradua)	36
2. A. G. Walker (1 Rudge)	36
3. S. D. Timson (1 Rudge)	36
4. C. Pressland (1 Rudge)	48
5. J. A. Manners-Smith (1 Triumph)	36

The main body came in together. Stanley's Singer did not seem up to its usual good form, and for some reason Hannis did an extra lap, so finishing some time behind the field. Taken as a whole the race was extremely well handicapped.

### B.A.R.C. AUGUST MEETING.

The Brooklands Automobile Racing Club will hold a meeting on August Bank Holiday, the 5th proximo, when the following motor cycle races will take place.

The eleventh short motor cycle handicap for all classes of motor cycles. Distance,  $5\frac{3}{4}$  miles.

The ninth long motor cycle handicap for all classes of motor bicycles. Distance,  $8\frac{1}{4}$  miles.

The first sidecar and cyclecar handicap. For all motor bicycles with sidecar, not exceeding 1,000 c.c., and carrying a male passenger weighing not less than  $9\frac{1}{2}$  stones, and for cyclecars as defined by R.A.C. and A.C.U., chassis weight unladen 6 cwt., engine not exceeding 1,100 c.c. Distance,  $5\frac{1}{4}$  miles.

In each case the entrant of the winner will receive 10 sovs. or cup at option, second 5 sovs. or cup, and third 3 sovs. or cup.

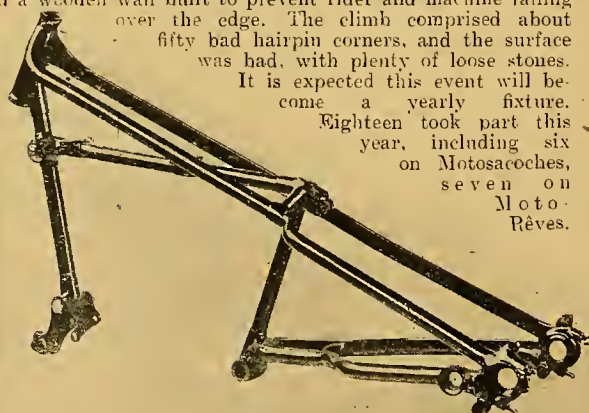

Entry fee for the first two events 10s. 6d. each, sidecar race £1. Entries close 23rd inst. to Secretary B.A.R.C., Carlton House, Regent Street, W.

## A SWISS HILL-CLIMB.

A hill-climb, which can best be described as a race up one of the famous Swiss mountain roads, was recently held in the neighbourhood of Geneva—the summit of the hill is called Treize Arbres. At one bad corner on the road a swerve would have meant a fall of about 1,600 feet, so the organisers had a wooden wall built to prevent rider and machine falling over the edge. The climb comprised about fifty bad hairpin corners, and the surface was bad, with plenty of loose stones.

It is expected this event will become a yearly fixture.

Eighteen took part this year, including six on Motosacoches, seven on Moto-Rèves.

New straight tube dropped frame of the latest 6 h.p. Rex for use by either sex.

and two on Peugeotts. The results were:

Class I. (Singles 300 c.c. Twins 350 c.c.)—1, Berlie (Moto-Rève); 2, Guignet (Motosacoche); 3, Jaquemod (Motosacoche).

Class II. (Single and Twins over 300 and 350 c.c.)—1, Lavanchy (Motor-Rève); 2, Pontis (Moto-Rève); 3, Pean (Peugeot).

Class III. (Open).—1, Ervin (Moto-Rève); 2, Lapalud (Moto-Rève); 3, De Angelis (Moto-Rève). These three also won the Amateur Class, finishing in the same order.

### SPEED TRIALS IN HEYTHROP PARK.

The open speed trials promoted by the Oxford M.C.C. are to be held in Heythrop Park, near Chipping Norton, Oxon, on Monday, the 22nd inst.

Double fees will be charged for late entries received up to 12 noon on the 20th inst., and should be sent to Mr. R. C. Davis, 12, Cornmarket Street, Oxford.

The classes have been arranged under the open competition rules of the Auto-Cycle Union, and the club regulations, as follows:

Class 1.—Junior T.T.

Class 2.—Senior T.T.

Class 3.—Standard touring singles or twins up to 350 c.c.

Class 4.—Standard touring single twins up to 750 c.c.

Class 5.—Single-cylinders (unlimited).

Class 6.—Twins (unlimited).

Class 7.—Touring sidecar combinations up to 1,000 c.c.

Class 8.—Touring cyclecars up to 1,000 c.c. R.A.C. definition.

# ENGLISH-DUTCH TRIAL.

## The Transit Arrangements for British Competitors and their Machines.

**T**HE complicated work of arranging a tour abroad has been rendered as simple as possible to the British contestants in the above trial, thanks to the help of the Touring Department of the Royal Automobile Club. Every competitor has had a type-written copy of the special transit arrangements forwarded to him. In brief the details are as follows:

On Saturday, August 3rd, the British riders will leave Liverpool Street Station (Great Eastern Railway), London, at 4.10 p.m., arriving at Parkeston Quay, Harwich, alongside the steamer at 5.45 p.m. A special truck will be attached to this train for the conveyance of motor cycles, and passengers' accommodation will be reserved on the train. The special rates are: 7s. 6d. for the transport of each motor cycle from London to the Hook of Holland (owner's risk), return fare 15s. (payable to the R.A.C. in advance).

Passengers' return fare from London to the Hook is £2 2s.; second class rail and first class on the steamer.

### Transit Arrangements from Harwich only.

Those who cannot join the party at Liverpool Street should make a point of reaching Parkeston Quay not later than 5.30 p.m. The cost of first-class return tickets between Harwich and the Hook is £1 13s. The cost for the transport of each motor cycle from Harwich to the Hook, at owner's risk, is 4s. 6d. each way, double journey 9s. The cost of the transport between Harwich and the Hook, and any passenger ticket required, should be sent in advance to the Secretary of the Royal Automobile Club (Touring Department), Pall Mall.

Motor cycles with sidecars will be charged double.

The return journey will be made on the night of Wednesday, August 7th.

It will be necessary for each member of the party, whether an actual team member or reserve, to obtain from the Royal Automobile Club before departure:

1. A special Customs card, by which the machines may be taken into the country free of duty.

2. An international pass, which gives the holder the right to travel in Holland on his ordinary British numbers.

### How to obtain the International Pass.

It is necessary for the holder of each international pass to carry a little oval plate bearing the letters "G.B." but this plate is supplied with the international pass. Before an international pass can be issued it is necessary for the owner and the machine to be examined by a duly authorised examiner, and it is necessary to write to the most conveniently situated examiner well in advance, making an appointment for the examinations to take place on a specified date. After undertaking the necessary examinations, the authorised examiner sends in a certificate to the R.A.C., who then forwards the international pass to the applicant.

It is most important that arrangements should be made well in advance, as the ordinary work of the Touring Department is excessively heavy at the present time of the year.

It is essential that the examiner should be supplied with three small photographs of each driver, measuring about 1½ in. square, head and shoulders only, unmounted.

### How to obtain the Special Customs Card.

The special Customs card, by which a motor cycle only, or a machine fitted with a sidecar, may be taken into Holland free of duty, can be obtained from the Touring Department of the R.A.C. on behalf of the A.C.U. free of charge, but it is essential that the following information concerning the machines should be supplied well in advance:

1. Owner's full name.
2. Home address.
3. Profession.
4. Make of machine.
5. Horse-power.
6. Number of cylinders.
7. Maker's number on engine.
8. Maker's number on frame (if any).

One of the small photographs is attached to the card.

Hampshire Motor Cycle Union hill-climb at East Meon. Percy Kiln (New Hudson) nearing the top of the rise. The hill, which is nearly two miles in length, appears to be an ideal one for hill-climbing purposes.

# Inter-club Hill-climb at Arms Hill.

North-west London M.C.C. v. Oxford M.C.C.

R. C. Davis (Oxford) makes a good climb with his 8 h.p. Chater-Lea sidecar.

W. A. Matthews (Triumph) of the winning team on the steepest part.

THE venue this year for what has now become an annual contest between these two clubs was Arms Hill, near Heuley-on-Thames. Each club turned up with fourteen starters, and as the performances of six only on each side were to be taken into account, it was thought that the struggle would be a very close one.

Shortly before five o'clock, Mr. F. G. Barton sent away the first man, R. A. Bishop, Oxford (6 h.p. Enfield sc.), who drove up without a falter. Following Bishop were H. F. S. Morgan, Oxford, and F. J. Wilmott, London (Morgan runabouts). Hal Hill, London (6 h.p. Zenith sc.), broke a belt; he was offered another start, but did not avail himself of it. It was unfortunate, as his failure meant a loss of 100 marks to his club. R. C. Davis, Oxford (8 h.p. Chater-Lea sc.), successfully accomplished the ascent. The passenger machines having been disposed of were followed by the solo motor cycles, each Oxford man being followed by a member of the N.W.L. The star performance of the day was undoubtedly A. C. Hardy's, Oxford (Norton), whose speed at the cannons approached 40 m.p.h.; he went up as straight as an arrow.

According to the regulations, six performances were chosen from each club to determine the winner. One of these had to be a sidecar, two had to be multi-speed solo mounts, while of the remainder not more than three must have engines over 500 c.c. The Oxford Club team proved the winners, with 560 points to 420.

The complete list of members of each club with their performances in marks are set out below:

OXFORD M.C.C.		N.W. LONDON M.C.C.	
R. A. Bishop (6 Enfield sc.)	100	F. G. Wilmott (Morgan)	100
R. C. Davis (8 Chater-Lea sc.)	100	H. Karslake (3½ Rover 3-sp.)	100
H. G. R. Slingo (5-6 Clyno 2-sp.)	100	G. E. Purchase (2¾ Douglas 2-sp.)	100
H. F. S. Morgan (Morgan)	100	E. F. Lawrence (3½ Rudge)	60
A. C. Hardy (3½ Norton)	100	King Smith (6 Bat)	60
F. Cooper (3½ Triumph)	100	H. E. Taylor (5-6 F.N. 2-sp.)	40
J. W. Tolladay (3½ B.S.A.)	100	G. H. Hollis (2¾ Douglas 2-sp.)	40
J. Lee-Evans (3½ Ivy)	100	H. Berlandina (2¾ Douglas 2-sp.)	40
H. A. Beard (3½ New Hudson 3-sp.)	60	L. Joiner (3½ Brown)	40
H. G. Hill (2½ Calcott)	60	W. King (S.I.A.M.T.)	40
H. G. Hill (3½ Bradbury)	60	Eric Rose (3½ P. and M.)	40
H. Askew (3½ Triumph)	60	H. J. Pooley (3½ Premier)	40
W. A. Matthews (3½ Triumph)	40	Claude Rose (3½ Rudge)	20
T. G. Hill (3½ James)	20	Hal Hill (6 Zenith sc.)	0
Total	1,100	Total	720

## SCOTTISH SIX DAYS' TRIALS.

The organisers of the Scottish Trials, the Edinburgh and District M.C., have been favoured with seventy entries for this important event. Below will be found a complete list.

The competition commences on Monday next, the 22nd.

R. Holloway (3½ Premier)	G. Bell (3½ New Hudson)
J. Oliphant (3½ Premier)	J. E. Chisholm (3½ James)
A. D. Scott (3½ Triumph)	Duncan Bell (5 A.J.S. sc.)
J. D. Morrison (5-6 Bat)	Charles W. Munro (2¾ Douglas)
R. S. Hood (6 Brough)	L. Newey (3½ Ariel)
A. A. Hay (4½ Quadrant)	C. T. Newsome (3½ Rover)
R. White (3½ Alldays-Matchless)	P. E. Tollfree (3½ Bat)
N. Soresby (3½ L.M.C.)	J. Steel (3½ B.S.A.)
A. J. Sproston (3½ Rover)	M. Pratt (3½ Alldays-Matchless)
F. Begley (3 Hazlewood)	A. F. Downie (3½ Ariel)
F. S. Douglas (8 Dot)	N. W. Downie (3½ James)
E. P. Macdonald (4 Norton)	A. O. R. Downie (2½ A.J.S.)
G. E. Cuffe (7 Indian)	R. G. Mundy
H. G. Dixon (3½ New Hudson)	G. T. Wood (8 G.W.K.)
H. Douglas (3½ New Hudson)	H. Baxter (3½ L.M.C.)
C. M. Keiller (8 G.W.K.)	

T. Silver (3½ Quadrant)	H. E. Wace (3½ L.M.C.)
L. E. Cass (4½ Quadrant)	W. Houghton (3½ Bradbury sc.)
Miss Muriel Hind (6 Rex)	W. Westwood (3½ Triumph)
S. J. K. Thomson (8 Bat sc.)	George Brough (6 Brough)
V. Taylor (3½ Rudge)	G. Taylor (3½ Rudge)
C. W. Meredith (3½ Bradbury)	Frank Smith (5-6 Clyno)
W. D. South (3½ Rudge)	J. R. Alexander (7 Indian)
Hugh Gibson (3½ Bradbury sc.)	W. B. Gibb (2¾ Douglas)
B. A. Hill (7 Indian)	G. L. Fletcher (2¾ Douglas)
J. S. Holroyd (2½ Moto-sacoche)	A. H. Alexander (2¾ Douglas)
H. Le Vack (2½ Motosacoche)	W. G. McMinnies (3½ Triumph)
J. H. Begg (3½ Rudge)	J. F. Morrison (2¾ Douglas)
R. Lord (6 Rex)	W. B. Little (3½ Premier)
F. C. North (3½ Ariel)	F. G. Edmond (3½ Humber)
P. W. Bischoff (3½ Triumph)	Bert Yates (3½ Humber)
E. B. Keiller (3½ Rudge)	A. G. Fenn (2¾ Humber)
W. Pratt (3½ P. and M.)	W. Creyton (2¾ Humber)
G. T. Gray (3½ Rudge)	F. J. Hutchison (5-6 Rex-Jap sc.)
G. E. Whitehouse (3½ Rover)	A. J. Dixon (3½ Singer)
J. Cocker (2½ Singer)	

### A Further Development.

YET another field of military utility has been found for the motor cyclist, who is gradually coming into his own (everything is gradual in this country where military matters are concerned). A new and somewhat romantic corps is in process of formation in which motor cyclists will be asked to volunteer their services. The new corps is termed the "War Kite Squadron," with headquarters at 11, Adam Street, Adelphi, Strand. It is a very high-flying corps both in actuality and metaphorically speaking, for it cares not a snap of the fingers for the War Office or the Royal Flying Corps—in fact, it is rather inclined to fancy itself a cut above both those institutions. The War Kite Squadron aims at producing on a voluntary basis an ideal intelligence service for our armies in time of war. Its man-lifting kites can go up even in a gale of wind to carry observers up into the air; the observer is linked to *terra firma* by a telephone wire, and next door to him a wireless kite is flying to speed all the information gathered across the waves of ether. The squadron has not sought, nor does it propose to seek, the approval of the military authorities—it is quite content to bide its time as a volunteer institution until the War Office itself makes the first advances. Already the London squadron has completed its skilled aeronautic ratings with willing recruits, and it has invited the Legion of Motor Cyclists to provide the men for the motor cycle section. Each squadron requires to enrol the services of one motor cyclist officer and ten N.C.O.s and men on motor bicycles. Their chief duty will be to carry messages telephoned down to them from the kite-lifted observer to army headquarters and to subordinate generals in the vicinity. Incidentally, also, the motor cyclists will be taught how to lay a telephone line when travelling at a high speed and also how to pick it up again at at least twenty miles an hour.

### A Uniform for the Legion.

It will be seen from the official notices in the Legion Magazine that a uniform has been designed and sanctioned for those corps of the Legion who decide to adopt it. The design is extremely ingenious, for it enables the jacket to be used both for civilian and military purposes by the simple expedient of turning up the collar and buttoning up the revers and adding the authorised belt and cap.

The material is of greyish waterproof fabric, the knickers are cut like riding breeches and laced below the knee, which gives a very smart appearance. When the collar is turned up it shows a band of scarlet round the neck, but when turned down it presents the appearance of an ordinary lounge jacket with outside breast pockets. The buttons are of leather. Messrs.

Alfred Dunhill, Ltd., are the contractors, and the whole outfit can be obtained for thirty-five shillings if ordered through organising officers.

### Army Manœuvres.

The Legion of Motor Cyclists has been invited to furnish motor cyclist despatch carriers for the army manœuvres in September this year, and this invitation may be considered as the first olive branch towards official recognition. Full details will be published in *The Motor Cycle* as soon as they are divulged. This is an extremely enjoyable way of taking one's holiday, and economical withal, since the pay and allowance will amply cover all expenses of the individual and of his machine.

### The Third Mobilisation.

It is greatly to be regretted that urgent affairs prevented Capt. Trapmann from being present at Nottingham on this occasion, and it is feared that owing to his absence several motor cyclists who wished to join the test failed to get their postcards returned to them in time. Owing to the holidays and manœuvres no further tests will be held until the autumn, and it is to be hoped by then that the military authorities will have been so favourably impressed with the value of the motor cycle that they will not require any more tests to prove to them that which is so obvious.

### The Legion of Motor Cyclists.

I am asked to say that all members of the Legion who have not yet provided themselves with the Legion badge should do so at once. This can be obtained from the Hon. Sec., at 128, Jermyn Street, price 1s. 4d. post free.

Mr. and Mrs. Barnes, of Surbiton, who are enthusiastic users of a 3½ h.p. Premier and sidecar. The hood and screen on the sidecar are worthy of note.

## CLUB NEWS.

**North Birmingham A.C.**

A hill-climb will be held at Weatheroak on the 27th inst.

**Mersey M.C.**

The team trial to Uttoxeter and back was held on the 14th inst. The winning team consisted of Baxter (6 Rex), P. Syvrett (6 Rex sidette), and A. J. Mason (3½ Rudge).

**Evesham M.C.**

On the 11th inst. a speed-judging competition was held. The numbers in brackets are the miles per hour the competitors drew. G. W. Whitehouse (Rudge-Multi) (16), 16½ miles per hour; R. D. Hodgkinson (6 Enfield and sc.) (20), 19½ miles per hour; E. Holloway (3½ Triumph two-speed and sc.) (9), 9½ miles per hour.

**Western District M.C. (London).**

The reliability trial for the Winter Cup was run off on the 14th inst., and proved most exciting. The course was 16½ miles round, starting from Gerrard's Cross, and had to be traversed eight times. The total distance amounted to 132 miles. Each circuit was timed. The results, subject to confirmation, were: 1, H. J. M. Hughes (6 N.S.U.), error (fast or slow in seconds) 73.9s.; 2, W. F. Ritchie (3½ Bradbury), 82.9s.; 3, R. F. Addey (3½ Triumph), 188.5s.

The next run is to Boulter's Lock, Maidenhead, on the 21st inst.

The petrol consumption trial fixed for the 27th inst. has been postponed until September, as the R.A.C. Associates' Meeting at Brooklands Motor Track takes place on that day.

**Brecon and Radnor M.C.C.**

The above club held its first reliability trial on Wednesday, July 3rd, over a course of 140 miles, *via* Builth to Aberystwyth, hence to Lampeter, Llandovery, and Brecon.

The following qualified for first-class medals: C. Nott (3½ Humber), F. Morgan (3½ New Hudson), J. G. Morris (3½ Bradbury), H. Jones (3½ New Hudson), J. Beynon (3½ Rudge), D. Fryer (3½ Premier), E. J. Allen (3½ Lincoln-Elk), R. S. Powell (3½ Bradbury), G. F. Jones (3½ Rudge), T. Cooper (3½ Rudge), G. Childs (3½ N.S.U.), L. Harpur (3½ Triumph), F. Phillips (3½ Rudge), P. Albutt (3½ Bradbury), and W. Evans (3½ Humber).

The special prizes for those running nearest to their schedule time were gained as follows: 1st, Hubert Jones (3½ New Hudson); equal 2nd, G. F. Jones and J. Beynon (3½ Ridges); equal 3rd, C. W. Nott (3½ Humber), F. Morgan (3½ New Hudson and sc.), and D. Fryer (3½ Premier).

**Grosvenor M.C. (Manchester).**

On July 7th this club carried out a very successful hill-climbing competition at the famous hill at Heyden Bridge on the borders of Cheshire and Yorkshire. The full course of two miles was taken. There were two classes, bicycles and three wheelers or cyclecars, of which there are several in the club. Results: Bicycles, H. V. Prescott (3½ Ivy-Precision); cyclecars, E. E. Crisp (4½ Eagle Runabout). (This machine, it is interesting to note, is twelve years old and the first made.)

**Lincolnshire A.C.**

Speed trials will be held at Thorrock Park, near Gainsborough (by permission of Sir Hickman Bacon) on the 20th inst. There will be three classes, No. 1 up to 350 c.c., No. 2 up to 500 c.c., No. 3 over 500 c.c. The formula  $C \times \sqrt{V}$  will be used.

**Rotherham and District M.C.C.**

A reliability run to Bridlington and back was held on the 7th inst. Owing to the rain in the morning only a poor number turned out. The results were:

Solo Mounts.—1, R. H. Gilling (P. and M.); 2, E. Cross (Triumph).

Sidecars.—1, W. Davis (James); 2, H. Page (Premier).

**Merionethshire M.C.C.**

The above club held a hill-climb on Bwlch-y-Groes on the 11th inst., starting from Bala, the distance being five and a quarter miles. Results: E. Wynne Hughes (3½ Triumph), 11m. 50s.; Arthur Williams (3½ Triumph), 12m. 49s.; O. P. Hughes (3½ three-speed Arno), 15m. 11s.; Dr. E. Williams (3½ Triumph), 18m. 48s. Enion Pierce, on his Rudge, failed at his first ascent, but afterwards was successful.

**Bristol M.C.C.**

The trial to the top of Porlock Hill and back was re-run on Saturday last, and a fine entry was obtained, with the result of a splendid competition and the conquest of Porlock Hill (despite its present very bad condition) by a large majority of the competitors.

The trial was a go as you please to Alcombe, 58½ miles from Bristol, then a non-stop to the top of Porlock Hill at 20 m.p.h., and then home again, checking at headquarters; total, 136 miles. One mark penalty for every second early or late. All over five minutes early or late declared out of competition. Results: 1, J. B. Kellar (B.S.A.), total error 8s.; 2, H. Wasley (Douglas), 21s.; 3, E. Kickham (Douglas), 25s.; 4, P. Grout (Quadrant), 74s.; 5, H. Moxley (Rover), 97s.

**Glasgow M.C.C.**

This club held their annual twelve hours' reliability trial on July 6th, and secured a record entry of twenty-six. There were twenty starters, and of these fifteen finished the severe course of 205 miles. In addition to the ordinary checks there were secret controls on certain twenty mile stretches, and the winners were those whose times were nearest to the schedule at all checks, both open and secret.

The following riders completed the course without loss of marks, and hence qualify for gold medals: W. Hood (Rudge), H. J. Macial (Rudge), W. Deans (Rudge), A. Pow (Triumph), A. Fraser (Rudge), G. W. Orr (Ariel), D. Reid (Rudge), G. Thomson (James), and J. Garner (Triumph).

The president's prize for the best performance was won by W. Deans, and the special prize, offered by Messrs. Stich and Roberts, for the best sidecar performance, went to Duncan Beel (5 A.J.S.). Lindsay (3½ Rover and sc.) was awarded a gold medal for his excellent performance.

Grosvenor M.C.C. hill-climb at Heyden Bridge. A group of competitors at the foot of the hill.

## Club News.—

**Redditch and District M.C.C.**

The result of the speed-judging contest was as follows: 1, E. Webb; 2, E. White; 3, L. Hadley.

**Oxford M.C.C.**

The second social run, to meet members of the Reading Motor Cycling Club, took place on the 26th ult., to the George Hotel, Wallingford.

**Ipswich and District M.C.C.**

The team trial arranged for the 29th ult. had to be postponed on account of heavy storms, until the 20th inst., the occasion of the run to Southwold.

**North Middlesex M.C.C.**

The Devonshire tour will start on August 3rd. at 3 p.m. On August 10th there will be an open reliability trial for ladies only.

**Hunslet M.C.C.**

There was a muster of over forty for the first invitation run. The route was *via* Otley, Ilkley, Wharfedale, Newbiggin, Masham, Ripon, and Harrogate.

**Blackpool and Fylde M.C.C.**

On the 7th inst. there was a reliability run to Harrogate and back, 155 miles, *via* Longridge, Clitheroe, and Skipton. Result: 1, S. O. Taylor (8 Rex-Jap); 2, R. G. Parker (2½ Douglas); 3, H. B. Bailey (3½ Triumph).

**Surrey M.C.C.**

A reliability competition from Guildford to Lyme Regis will take place on the 20th inst. The controls will be as follows: Alton, Romsey, Ringwood, Dorchester, to Lyme Regis. Every section must be covered without a stop.

**Middlesbrough and District M.C.C.**

The fuel consumption trial was held on Saturday, 6th inst. Result:

Competitor and machine.	Fuel.	m.p.g.	ton-m.p.g.
Gilchrist (3½ Zenith) ...	benzol	162	27.7
Liddle (3½ Triumph sc.) ...	"	92.3	24.8
Challons (3½ Premier) ...	petrol	133	21.1
Deuchars (3½ Roc-Jap) ...	"	115	18.8
Bowers (3½ Roc) ...	"	104	16.3
Jefferson (3½ Triumph) ...	"	88.8	12.7

J. W. F. Tranmer (2½ h.p. three-speed Humber), hon. sec. of the Scarborough and District M.C.C.

**Speedwell B.C.**

The Speedwell Bicycle Club, which was founded in 1876, has formed a motor cycle section, to be run on touring and sociable lines. Anyone interested can obtain information and entrance forms from Mr. W. V. Pinfield, 1, St. Alban's Road, Moseley, Birmingham.

**South Birmingham M.C.C.**

On the 20th inst. the club will hold a sporting competition, run, and hill-climb on an unknown hill.

The committee have decided that the Allday cup be awarded as a perpetual trophy to the member making the best performance in club competition during the season, and the Lyett cup be won outright by the amateur in a similar manner.

**NOTICE.**

Owing to the great increase in the number of clubs in the country and the general desire expressed for notices respecting club doings to appear in the club news pages, secretaries are requested to be as brief as possible.

**THE MOST NORTHERLY MOTOR CYCLE CLUB.**

The most recently formed and the most northerly motor cycle club on the mainland is called the John-o'-Groat's M.C.C. It is open to the County of Caithness with headquarters at Thurso. The opening run consisted of a tour of sixty miles by John-o'-Groat's and Wick. The run was not

officially observed, and the stops for tyre and thirst troubles were not recorded against the riders. The home journey was broken at Wick, where the club had tea. The club is to arrange for a speed trial and a hill-climb during the summer.

The newly formed John-o'-Groat's Motor Cycle Club—the most northerly club in Great Britain.

Members gathered at John-o'-Groat's on the occasion of the opening run.

## A NEW LONGUEMARE CARBURETTER.

Years ago the Longuemare was the best known and most generally used carburetter on motor cycles. That was in the days of tank lever control. Longuemare Frères have now introduced a new automatic carburetter suitable for motor cycles, embodying interesting departures, the action of which may be easily seen from the appended drawing.

The float chamber is on the usual lines, except that the float needle is very short and is held up by a small spring ball valve. The float itself is guided by a pin attached to the lid. A neat filter of good proportions is fitted at the petrol intake. The jet is a single one and

The latest Longuemare motor cycle carburetter.

rather long, and is surrounded by a brass piston throttle. The part shown black in the drawing is stationary, but the other part may be raised by means of a lever and Bowden wire attachment. All the air is taken in from the base of the carburetter and passes directly past the jet. It will be noticed that owing to the contour of the piston valve, the air opening around the jet is gradually increased as the throttle is opened. This action gives the effect of a choke tube, variable with the throttle opening. The mechanism is easily accessible, and the float chamber may be swung to any position.

A handle-bar controlled piston throttle is a new departure for this firm, and enthusiastic users of Longuemare carburetters in the old days will no doubt try the latest design with interest. The agents are E. J. Hardy and Co., Queen Victoria Road, Coventry.

## A NOVEL ELECTRIC LAMP.

A lamp which we referred to as being seen on one of the competitors' machines in the London to Edinburgh run was the Nups, sold by J. A. Husbands, 14a, Leicester Street, Leicester Square, W. The lamp is an electric one, and has the bulb placed centrally in the internal reflector, and in front of this is a powerful dioptic lens; consequently, a very fine and powerful beam of light is projected. As far as possible the lamp is

devoid of all exterior excrescences, and is, consequently, very easy to keep clean. The particular lamp shown, which is of a peculiarly pleasing appearance, is designed specially for sidecar work, and has internal sockets for the fork bracket. Mr. Husbands informs us that he is about to get out a smaller type for motor bicycle

use, and will endeavour to light it by means of dry batteries. This lamp will be a replica in miniature of the one we illustrate, and, as is the case with the latter, will be provided with a neat telescopic focussing arrangement for the bulb.

## A SIMPLE SPRING IMPROVEMENT.

Many cars are now fitted with spring devices interposed between the shackles of the springs on which the chassis is suspended. These springs absorb all the minor road shocks which the larger leaf springs are too stiff to take up. This excellent system has now been adopted for sidecars, and the accompanying illustration shows a set supplied by Mr. H. Taylor, of Store Street, Tottenham Court Road, W.C.

## A NEW BELT PUNCH.

The Dunlop Tyre Co. seldom do things by halves, and, having been most successful with the round topped Dunlop belt, they have now introduced a belt punch which has been specially designed to take this pattern of belt in any size from

5 in. up to 1 in. It pierces a clean hole in the centre of the belt, and, although primarily intended for round topped belts, is equally suitable for the flat pattern.

## A RECIPROCATING VALVE GRINDER.

The Warrow reciprocating valve grinder is an ingenious tool placed on the market by Brown Bros., Ltd., 15, Newman Street, Oxford Street, W.

It will be seen on reference to the sketch that the grinder somewhat resembles an ordinary geared brace, but the rotary motion of the handle, instead of producing a continuous motion of the spindle, causes the latter to move round half a revolution and return once to every revolution of the handle. The reciprocating motion is produced simply by the aid of a bevel gear wheel on

the handle from which more than half the teeth are missing, so that when the teeth on the wheel are engaged with the top bevel on the shaft it drives the shaft in one direction, and when they engage with the bottom bevel the spindle is driven the other way.

Another new fitting, by the same firm, takes the form of a sidecar lamp bracket. It is substantially made and drilled so as to be fixed on to the spring by the existing U clip, a special clip being supplied if necessary.

### Trial Lessons Free.

The London School of Motoring, 19a, Tottenham Court Road, W.C., inform us that they have decided to give a trial lesson free to anyone who is contemplating the purchase of a motor cycle.

### In Case of Need.

Telephone services are being organised on main roads by the A.A. and M.U. Patrol sentry boxes are being erected at intervals along main roads, and in each will be installed a telephone connected to the nearest exchange. Members will be able to use these telephones free of charge except in the case of trunk calls, when the usual fees will be charged.

### Peugeot Motor Cycles in England.

One of the most successful motor bicycles made in France is the Peugeot, and during the recent revival of the motor cycle industry in that country, in nearly every competition in which it has taken part, it has emerged with flying colours. These machines will in future be sold by Messrs. Peugeot (England) Ltd., 10, Brompton Road, S.W. The types marketed are the 2½ h.p. light weight singles, and the 5 h.p. and the 7 h.p. twin-cylinder models. These machines are fitted with Truffault spring forks, which are exceedingly comfortable.

# PARSONS RAPID REPAIR KIT

## Punctures lose their terror

In the old patch and solution days, punctures were serious things. But since the introduction of the Parsons Rapid Repair Kit punctures have lost their terror. With a Parsons Rapid Repair Kit in your toolbag or pocket, the permanent mending of a puncture is only a matter of three or four minutes' easy work. You locate the puncture, take out about a foot of tube, punch the hole clean, insert a plug, and compress same with the special pliers supplied. That completes the job. And a puncture mended in this way is permanent—it can never leak, neither can the plug creep.

Write for  
descriptive  
booklet.

Complete Kit, which measures 7" x 4", and weighs 1 lb., contains piercing tool, stretcher, closing pliers, and 12 plugs. The cost is

The Bluemel Mascot plug will stand up to the severest work it is possible to give it—and all the time. It will get the last ounce out of your Engine.

A Triumph rider does 14,000 miles with one Bluemel-Mascot plug.

Dear Sirs, Rose Eden, STAINES. April 15th, 1912.

I am taking this opportunity of thanking you for the plug you sent, and saying what I think of the last one I had.

I ran it over 14,000 miles on a Triumph machine and during the whole of that time it was never even cleaned, in fact it gave no trouble whatever. Yours truly,  
(Signed) H. Parkinson

# CORONET SIDE CARS

You take no risk if you purchase a **CORONET**. Satisfaction is assured. They are scientifically constructed; weight is correctly distributed, consequently "side-drag" is imperceptible. Write for descriptive list post free.

CAN BE OBTAINED FROM ALL DEALERS.

Model 1. High-class Canoe-iron Body, Cranked Axle, and other improvements, £6 6 0.

Model 4. Ornamental Cane Body, as illustration, or Close Reed Cane Body, £8 8s.

**CORONET DETACHABLE JOINTS** enable our side-cars to be detached in one minute.

We illustrate herewith the "Coronet" Quick-detachable joints, which are fitted to all our models. To detach is simply a matter of unscrewing nut about five threads. When attached, and nut screwed tight, the joint is solid and perfectly rigid, and does not rattle like some patent joints held in position by springs and pins that are liable to shake loose.

**MAGNETOS. MAGNETOS. MAGNETOS.**

We have a large stock of the best makes from 59/6. Your old coil and acc. taken in exchange.

**25/- ALLOWED**

for your B. & B. or Amac Carburetter if fitted with H.B. control in exchange for a new 1912 **SENSPRAY** or **BINKS**.

**BOOTH'S MOTORIES,**  
KEIGHLEY MILLS, BEDFORD ST. NORTH  
(off Pellon Lane), HALIFAX. Tel. 1062.

Read what users say: 14, Warwick Road, New Southgate, N.

Dear Sirs,—Some time since I purchased from you a shop-soiled sidecar, and after running same for about 3,000 miles felt I should like to let you know how very satisfactorily it has been running. The chassis is now as true all over as on the day it was delivered to me, and that in spite of being run on many occasions with two passengers and under the worst of conditions.

After seeing the sorry turn-outs some of my friends have paid three times as much for, after barely 1,000 miles' running, I feel it only due to you to send this appreciation with the usual disclaimer.

You are at liberty to use this letter as you please, and to give my name and address to any enquirer. Personally I have, and shall, always recommend a "Portland" to anyone who wants a practical and thoroughly efficient sidecar.

Yours faithfully,  
(Signed) W. E. BAKER.

A New Hudson rider says:

Ilfley Road, Oxf.-rd.  
... I think this is good evidence of the strength and reliability of your machines.

The way we go up hills is simply marvellous. The machine simply advertises itself wherever it goes, and causes a lot of attention with one of Maude's "Dutch Clog" sidecars attached.

I have driven both motor cycles and cars for over five years, and have never had a turn-out give such satisfaction.

You can use this letter if you like, but I expect you have any number of such letters.

(Signed) G. S.

**1907** Genuine Minerva, 3 h.p., m.o.v., new B. and B. h.b.c., carburettor, also accumulator, footboards, powerful and perfect; £10 only.—514, High Rd., Leyton. [2649]

**VINDEC** Special, 3 1/2 h.p., 2-speed, and sidecar, new Michelin Trident on back wheel, 1912 Amac, Bosch mag., lamps, etc.; £22.—Chatwin and Hartley, King St., Richmond. [2547]

**PREMIER**, 1912, 3 1/2 h.p., Armstrong 3-speed gear, head lamp, horn, extra belt (Whittle), 2 tool-bags, etc., run 2,000 miles, perfect order; 45 gns.—Read, Sheerness. [2631]

**MR. GWYNNE'S** 1911 T.T. Special Triumph, very fast, and complete with max. hand speedometer and watch; bargain at £38.—Apply, Pond, 349, West End Lane, London. [X6769]

**TRIUMPH**, 1906, all bearings as new, var. pulley, very fast and powerful, guaranteed in perfect order; £16/10, bargain; stamp, reply.—Mullis, The Grange, Staplecross, Sussex. [2435]

**3 1/2** h.p. Chater-Pafnir, watertight Bosch, B. and B., 32 F.R.S. head light, new belt and tubes, Chinchers, tools and spares; bargain, £16/10.—14, Sheringham Rd., Barnsbury, N. [2682]

**3 1/2** h.p. Zedith-Gradna; £34; late 1910, excellent condition throughout, fine engine, 1912 B. and B., Quick Grip lever, horn, tools.—110, Snareshill Rd., Streatham (after 6 p.m.). [2550]

**DOUGLAS** Standard Model, new October, 1911, very little used, tools, spare inner tube, new Lyso belt, new Lucas lamp; £31/10, bargain.—Bridges, 53, Bridge Rd., Uxbridge. [2643]

**T.T. Rudge**, with Brooklands exhaust pipe, and 3-speed Singers, in stock, and ready for your summer holidays; exchanges.—Crow Bros., Motor Cyclists' Garage, 190, High St., Guildford. [2702]

**MOTOR CYCLE**, 3 1/2 h.p. Stevens, very powerful, tries nearly new, extra band, in splendid running order; first offer of £12, wrong double.—Apply, Down View, Dyke Rd. Av., Brighton. [2427]

**ANGLO-SAXON**—West End agents for the celebrated Sun 3 1/2 h.p. Precision 3-speed, the ideal sidecar machine; trial runs by appointment; £53/11 cash, exchange, or instalments.

**ANGLO-SAXON**—West End agents for the celebrated Kynoch-Jap 4 h.p. 3-speed; cash, exchange, or instalments.

**ANGLO-SAXON**—J.A.P. Twin mag., Chater-Lea fittings, Whittle belt, splendid order; any trial or examination; £27/10; cash, exchange, or instalments.

**ANGLO-SAXON**—Several 2nd-hand machines from £10; any reasonable offer accepted; most clear; cash or instalments.

**ANGLO-SAXON** Motor Co.—Note our address: 100, Bolsover St., Gt. Portland St., W. Phone: 4044 Mayfair. [2708]

**BAT-J.A.P.**, 6 h.p., Show finish, only ridden 200 miles, tyres unpunctured, with lamp, horn, spares, two spare inn. Dunlop; £54, or best offer.—Burnett, 29, Herbert Rd., East Dulwich. [2608]

**BAT-J.A.P.**, practically new, 8 h.p., free engine, Cewey speedometer, large Lucas horn and lamp, Pillion seat; any trial; £62/10. Phone: 8179 Central.—Atkins, 14, Bartholomew Close, E.C. [X6636]

**MINERVA**, 3 h.p., 1912, B. and B., free engine, Whittle, Continentals, low, fast, with 6in. sidecar, thoroughly overhauled, new condition; £25 lot.—45, Bismarck Rd., Highgate Hill, N. [2447]

**DOUGLAS**, just completely overhauled, splendid condition; any examination, owner bought higher-powered machine; seen any time.—Heath, Ophir Laundry, Park Lane, Tottenham, N. [2092]

**TRIUMPH**, 3 1/2 h.p., 1909, little used, excellent order throughout, new belt, head lamp, horn, spare belt, valves, tools, etc., buying sidecar machine; £30.—18, Onseley Rd., Wandsworth Common. [2673]

**6** h.p. Twin Sarcles, nearly new, Chater-Lea frame and fittings, adjustable pulley, new B. and B. carburettor, in splendid condition; any trial; £22.—D., 8, Upper Cedars Mews, Cedars Rd., Clapham, S.W. [2411]

### Designs of the Future.

**U**NTIL this year the history of the T.T. race has led the public to imagine that there was some tangible reason for allowing multi-cylinder machines a larger cubical capacity than singles; 1912 has proved that 500 c.c. twins are as fast and as good climbers as singles of equal volume. This being so, we venture to suggest that it might be advantageous for manufacturers who have up to now devoted all their experience and energy to perfecting the single to turn their attention to the advantages to be derived from two-cylinder engines.

The single scores greatly on the question of simplicity, and also from a manufacturing point in cheapness of production, but those who have had experience of both types will agree that the best singles are not so comfortable to ride as the most perfect twins. A twin-cylinder engine provides an evenness of running that is most fascinating, and gives one the impression of being towed along as compared with the propelling effort of the single.

If the twin had had the same attention bestowed upon it as the single, it would be an even more perfect article to-day, but in the opinion of many engineers the multi-cylinder is the motor cycle engine of the future.

When designs for 1913 are under consideration it might also be worth while to ask whether we are not rather too prone to accept the conventional type of frame as final in motor cycle construction. Departures from recognised and successful designs require the most careful deliberation, but past events have proved that it is possible to be unconventional and at the same time successful.

### Youthful Drivers and Recklessness.

**T**HE question of the reckless driving of motor cars and motor cycles by a certain section is creating a great amount of publicity at the present time. It is hardly possible to pick up a paper which includes a column of cycling notes without observing some bitter complaint of the recklessness of some motorist. The push cyclist is perhaps the best person to judge in these matters, although his opinion of motorists is likely to be somewhat biased, as there is a growing feeling abroad that cyclists are gradually being driven off the roads by the number and speed of cars and motor cycles and by the dust they create. We do not attempt to deny the fact that there are unfortunately a lot of careless motor drivers on the roads, just as there are casual and thoughtless push cyclists who apparently do not know the common rules of the road. As we have often pointed out, the reckless driver endangers not only himself, but also those with whom he may collide.

Whilst on this subject, we may draw attention to a recent decision of the National Cyclists' Union in discussing this matter. Believing that the youthful motor cyclist is the worst offender, the N.C.U. has resolved to make an attempt to have the law amended which permits boys of fourteen years of age to ride a motor cycle. An important point also discussed by the same body is that a juvenile driver may in the case of an action for damages caused by a collision successfully plead infancy. In this connection the N.C.U. will endeavour to get legislation altered to make parents or guardians responsible for damage caused by minors when driving motor vehicles.

## CYCLECARS: THEIR ADVANTAGES AND DISADVANTAGES.

WILL THE CYCLECAR DISPLACE THE  
SIDECAR?

**U**NDoubtedly the cyclecar has arrived, and it will most assuredly stay, but what final form will it take, and will it oust the popular sidecar? These questions are not answered so easily as might be expected, for at the present moment, though cyclecars are by no means new, and puzzled designers years and years ago, the miniature four-wheeler is in the chrysalis stage, and cannot be expected to hatch into its final perfect shape until the many and various forms at present under construction have undergone long and strenuous tests. There are even now several very clever designs of cyclecars to be bought which run extremely well, and a few which have already competed successfully in long-distance events. The general run of cyclecar is, however, not anything like so satisfactory as the modern motor cycle, and there is no hiding the fact, but this is hardly to be wondered at as it is a comparatively recent development. Certain light four-wheelers known as quads existed in the very early days, but most of them were given up on account of the difficulties experienced from vibration.

### Vibration Trouble.

This trouble is, unfortunately, not yet extinct, and it is from vibration that the cyclecar designer still has most to fear. I have come into contact with several cyclecars and more cyclecar owners, and nearly all have, after the first few weeks, grumbled to a greater or less extent about their machines falling to pieces. Sometimes it has been a strained and twisted frame, but more often it has been mudguards rattling and the stays breaking, or nuts and bolts falling off and fittings coming loose, belts slipping, or rear wheels lying down on corners, etc. All this does not necessarily imply discredit to the manufacturers, for the public

demanded cyclecars before the majority of manufacturers were ready, and it is really wonderful that good machines have been evolved in the time. The idea of a miniature motor car sounds so simple that few anticipate any more trouble than with a car.

### Light Cars.

At the present moment there is a decided reaction against the ultra light motor cycle engined, belt-driven runabout, and one or two large factories are considering, or even actually constructing, machines with four-cylinder water-cooled engines, three-speed and reverse gear boxes, and shaft drive to a live axle. Here, however, other difficulties begin to crop up. The weight becomes excessive, and the machine develops into a small car instead of a cyclecar, and the price necessarily increases, which must not be the case if the cyclecar is to become a popular means of locomotion. I believe it is quite possible to make and sell a machine on these lines at £125 if manufacturers will refrain from slavishly following car design, but great care will have to be exercised to prevent the machine becoming nasty as well as cheap.

There is no doubt that a smooth-running four-cylinder engine would increase the life of nearly all parts, especially tyres, etc., and be far more comfortable to drive, but it is a debatable question whether it would not be better to build a sound two-cylinder engine and put the money saved into first-class fittings all round. Too many people imagine that a good engine makes a good machine, but this is by no means the case, as a weak frame or badly designed transmission more than counteracts the advantage given by the best engine ever built.

So far cyclecar trials have been few and far between, and have been very badly supported by most

THE MEDINGER LIGHT RACING CAR.

This machine, which was built by M. Medinger, one of the winning Sunbeam drivers in the Grand Prix car race, might reasonably be classed as a cyclecar. The motive power is a single cylinder engine and the driving axle has no differential gear. The pointed torpedo front and extremely narrow radiator will be noted.

**Cyclecars : Their Advantages and Disadvantages.—**

manufacturers at that, consequently the public have had very little chance of deciding on the merits and demerits of the new type of machine. Now comes the manufacturers' opportunity. The Auto Cycle Union Six Days' Reliability Trials are to be held next month, and if cyclecars can prove their worth and utility in this event it will have a more lasting effect on the public than meteoric flights round Brooklands or even a good performance in a one day trial. I have been given to understand that at least one cyclecar will be entered in the A.C.U. Six Days' Trials, and its performance, together with those of other cyclecar entrants, will be closely watched by a large section of the public, who only want to be convinced that the cyclecar is reliable to place their orders at once.

**Cyclecars v. Sidecars.**

So far I have striven to point out the disadvantages under which manufacturers are working, for there is a very general opinion among the motor cycle public that the cyclecar is not yet as good as it looks on paper. As to its utility, who can doubt that in a short time cyclecars in some form or another will be common everywhere? To some degree they will replace sidecars, which, comfortable and popular though they be, are at the best a makeshift, and a particularly unmechanical makeshift as well. They will be used by country doctors and all those who

have to cover a large area in a short time and wish for more comfort and cleanliness than a motor cycle provides. They will be used by owner-drivers of large and moderate-sized cars for short trips, thus avoiding the necessary cleaning of the big machine; and they are bound to become extremely popular for light delivery work.

Now to answer the question of the final form. There are sure to be two distinct classes of cyclecars. (1) A machine which will cost not more than a motor cycle and sidecar, *i.e.*, £75 (I do not mean the most expensive motor cycle with the best possible sidecar, but a sound touring mount), for the keen motorist of limited means. This will necessarily be a little crude, but provided it is well designed and built should give every satisfaction. (2) A more luxurious article which must have at least three speeds and reverse on account of its weight, and which must also have a positive drive to the rear wheels. Probably the motor cycle engine pure and simple will be fitted to the first mentioned type, and a water-cooled engine or specially designed air-cooled engine to the second. Whether three or four wheels are to become the fashion is a subject on which we have already heard much, and are likely to hear more. The writer favours four wheels, though there is much to be said on both sides.

Finally, let us hope that the new branch of the industry is not to be handicapped by heavy taxes, for the cyclecar is essentially the vehicle for the man of limited means.

UBIQUE.

The ubiquity of the motor cycle is demonstrated in the above picture, which shows a group of Motoracche riders stranded at the Pyramids.

## OCCASIONAL COMMENTS.

By "IXION."

**Oil Carriers for Three-speed Hubs.**

I have failed to find in the accessory factors' lists any suitable container for reserve supplies of hub oil on long tours, but I have satisfactorily solved the question by purchasing one of the little leather cases designed to hold a half-pound tin of carbide. The tin is oiltight, and serves the purpose admirably.

**The Carriage of Spare Belts.**

After trying every device on the market, I have come to the conclusion that a belt case is the best way of carrying a single spare. As belt cases are subjected to considerable vibration, I fasten mine with two or three steel plates, bolts, and nuts, used by some makers for attaching toolbags to the carrier. If the pins are burred over these cannot vibrate loose.

If I am starting on a long tour, or using a sidecar—circumstances which render the carrying of one or two spare belts advisable—the leather belt goes into the case, as it requires protection from wet and dust; and I fasten the spare rubber belt to the carrier by a couple of straps.

**Belts and Pulleys.**

Fierce competition now exists in the motor cycle world, and will in time force the bulk of the demand into channels where belt-life is longest, and where the liability to belt slip is smallest.

Put into practical terms, this tendency is bound to enforce one of two alternatives upon makers. Either they will have to fit ugly belt shields, protecting their drive against slip, or they will have to fit combined belt and chain drive.

That a combined drive must prolong belt life and reduce belt slip is obvious from the following considerations. A maker desires to adopt  $4\frac{1}{2}$  to 1 as his standard roadster gear. If he drive direct from a small engine pulley to a rear belt drum, his belt will have about twelve square inches of contact surface on the front pulley; if he employ the combined drive, effecting half the reduction by chain and sprocket gear, he can use an 8in. counter-shaft pulley, on which his belt will have twenty-four square inches of contact area. *Verb. sap.*

**Other Views**

The writer of the motor cycle notes in the *R.A.C. Journal* takes the view that the Junior T.T. Race points rather to an ultimate conquest by the chain, and to the urgent need of more weather guarding. I am, however, almost convinced that the present alternative is between belt shields and combined drive. I have often used belt shields, and they can certainly be made efficient. But they are always ugly in aspect, they obstruct access to the belt and pulleys, they do not prolong the life of the belt, and they are very easily damaged. Moreover, the Junior T.T. threw no light whatever on their merits, while it afforded a convincing demonstration of the merits of the combined drive. Consequently I am sure the race will give a healthy impetus to combined drive.

The sole drawback to combined drive is an extremely minute and fractional decrease in efficiency, due to the nominal friction of a ball bearing shaft, chain, and chain wheels, and this is trivial compared to the firm grip and increased wear of the belt.

**Automatic Carburettors.**

I am "a prood man the day." For several years past I have been urging the value of automatic carburettors as a selling point with amateur customers who possess little technical skill. I have not previously seen the fruit of my labours. Many accessory firms have patented automatic and semi-automatic carburettors, but the motor cycle manufacturers have not been eager to adopt them as standard, and have continued to fit two-lever types.

At the present moment I am testing a single lever carburettor, produced by one of our most famous motor cycle factories with an eye to its 1913 models. It is early days to say whether the device will be standardised or not, but the preliminary tests point to its excellence. With the original two-lever carburettor it was difficult to start the engine by pulling up the back wheel; with the one-lever vaporiser it starts first pull, thereby showing that the mixture provided is of the correct proportions.

Either on the stand or the road the carburettor gives even and smooth acceleration, without lag or choke, from the first notch to the last, whether the throttle be banged or glided open. I have fitted an extra air intake, but cannot induce the engine to take more air at any speed than the automatic device supplies. I have closed some of the fixed air inlets in running, without obtaining any improvement in results. A revolution counter shows that the maximum efficiency is, if anything, a shade better than the original two-lever device procured, while the fuel consumption remains unaltered. The carburettor is, therefore, extremely promising.

It is useless for correspondents to write and ask who are the makers of the device, as I am pledged to secrecy for the present. I merely give this brief description of my experience in the hope that other leading manufacturers will seriously consider automatic and semi-automatic carburettors for next year's models.

The North-west London v. Oxford M.C.C. hill-climb at Arms Hill. A competitor making use of his feet to reach the top.

## Cape Peninsula M.C.C. Speed Trials

ON June 22nd the C.P.M.C.C. held a speed trial over a course approximately  $1\frac{1}{4}$  miles long on the road from Durbanville to Malmesbury. The results were as follows: T. C. L. Smith ( $2\frac{3}{4}$  Torpedo), first on formula; J. P. Faucis ( $3\frac{1}{2}$  Rudge), second on formula; N. S. Olive (7 Indian), fastest time. The road surface was in excellent condition, except for a dried-up watercourse about 200 yards from the finish. This caused rather a severe bump, so an official was posted at the spot to warn competitors. There was a good representative entry, and some fast speeds were attained.

T. C. L. Smith had to stop on his first attempt, owing to some horses wandering about the course. However, after they had been driven off, he succeeded in making very good time. Many of the best known British machines were included in the entry list.

Cape Peninsula M.C.C. Speed Trial at Harting Point. T. R. Butler (Zenith), the president of the club, is seen gathering speed in the flying start event.

The event was run off under ideal conditions, and was consequently a great success.

## Another West-country Hill Conquered.

TRISCOMBE Hill between Bagborough and Crowcombe, and about ten miles west of Taunton, has at last been successfully scaled by motor cycles. The rise commences at the old Blue Ball Inn, and runs direct up the face of the Quantocks to the well known Triscombe Stone, celebrated as a meeting place for followers of the red deer. The gradient is about 1,000 yards in length, and rises 450 feet in this distance, with a gradient in places steeper than 1 in 6. The difficulty in ascending is to keep down to a low enough speed and dodge the boulders. On Tuesday last week W. Pratt, R. M. Marians, and W. Drake, accom-

panied by W. G. Potter, H. E. Potter, and Goldsworthy Crump, of the Taunton and District M.C.C., inspected the hill, and then Pratt mounted and made a perfectly clean ascent. He was immediately followed by R. M. Marians, who did likewise. W. Drake came up fast and well considering the surface. Later, he made a second climb at reduced speed with equal success. W. G. Potter also made an excellent ascent. As if this were not enough, Pratt came down to the steepest and loosest place, started up, and got away on the clutch in splendid style. The four machines used were 1912 standard P. and M's. T.G.C.

1. W. Pratt (3½ h.p. P. and M.), who made the first ascent.
2. The four P. and M. riders at Triscombe Stone.
3. W. Drake making an ascent. The rough state of the road will be noticed.

# MILITARY MOTOR CYCLING NOTES

BY "CELESTIER"

## Autumn Army Manœuvres.

**T**HIS year the Autumn Manœuvres are to be on a larger scale than ever, for in addition to the fifty thousand regular troops taking part, there will be some seven thousand Territorials, half of whom will be cyclists. In order to provide the necessary staff of generals' orderlies and umpires' messengers no fewer than sixty civilian motor cyclists will be required. Of these twenty are to be found by the A.C.U., and the remaining forty will be selected from members of the Legion of Motor Cyclists.

The period for which the services of the majority of these will be required is from September 14th to the 21st, and each motor cyclist will receive six and sixpence per day petrol allowance in addition to his board and lodgings.

Already many applications have been sent in by motor cyclists anxious to enjoy this novel way of spending a holiday, but there are still several vacancies for suitable men, preferably those who have attended previous manœuvres or who have had some military training. Preference will, of course, be given to men who are already members of the Legion of Motor Cyclists. Those who have not yet registered themselves as members should do so at once, and send in their application to the Hon. Secretary of the Legion, 128, Jermyn Street, London, W., together with a stamped addressed envelope, 1s. 4d. for the Legion badge, and a penny stamp.

In due course full details will be posted to the selected candidates, and next week I hope to be able to give an advance copy of these.

## What Army Manœuvres Mean.

For the benefit of those who have not hitherto been lucky enough to enjoy the experience of going out on army manœuvres, I will sketch a brief outline of what their duties will be. They will be asked to rendezvous at some hotel in East Anglia on the appointed day, and there to report to the general to whose service they have been told off. That night there will be no work required of them, and until the following afternoon they will probably be free.

Then at a moment's notice a motor cyclist messenger will be called up by a staff officer and handed a despatch to deliver to a general commanding perhaps twenty miles away, and the motor cyclist must, of course, move as fast as his engine will take him.

For this one glorious week he need have no thought for police traps nor speed limits—the faster he goes the better everybody will be pleased.

When the message is delivered the rider is either instructed to return with a reply or allowed to make the best arrangements he can for the night. Sometimes this will mean shaking down with the nearest body of troops, but usually the motor cyclist will be told to look for dinner and a bed for himself and to charge the account to the authorities.

So on, day after day, the motor cyclist's time will be occupied in alternating hours of complete idleness, watching long columns of troops defile past him, and in occasional exhilarating bursts of speed, dashing off on some errand of importance.

## A Few Hints.

It must be remembered that quite half of the despatch riding is done after sunset, and therefore an efficient lamp is very essential.

It is advisable to provide oneself with a loud whistle (the "Thunderer," to be had at any ironmonger's, is recommended), for troops on the march pay not the least attention to the hooting of a motor horn or siren, be it ever so loud, but discipline teaches every man to look round when he hears a whistle—it is, in fact, the only way of clearing a path for oneself along a road congested with troops.

Another point worthy of attention in passing infantry is to try to make as little dust as possible. These poor fellows have a pretty rough time of it on manœuvres after marching their thirty odd miles a day, and they have to swallow an appalling amount of dust raised by their own feet without taking into account motor dust. A little consideration in this matter will win the motorist deep, though perhaps unvoiced, thanks, whilst consistent neglect of this will tend to unpopularity—to use a mild term.

There is one part of an army on the move against which motor cyclists should be warned—it is the cable and air line telegraph companies of the Royal Engineers when engaged in paying out or picking up a line. Their movements cannot be depended upon, they do not keep to the left of the road, and they are liable to stop dead or turn round at any given moment.

Three lightweight riders who survived the Coventry and Warwickshire M.C. severe one day trial of 182 miles. The riders are G. Smith (2½ h.p. Humber), Sam Wright (2½ h.p. Humber), and Alec Walsgrove (2½ h.p. Hazlewood). On the right is Ambrose Elson, the trials hon. sec.

"MY most exciting ride took place at Pontypridd in 1903," said Bert Yates, who has been riding Humber machines since the very earliest days of motor cycle racing. "The race was a five miles handicap, and I remember that I had to give the limit man  $3\frac{1}{2}$  minutes start. The track was well banked for those days, but not sufficiently so for the speed we reached that day. The top of the banking was guarded by board fencing, supported at intervals by stout posts. I had all my work cut out to pick up my handicap, and soon found myself at the top of the banking. Next I was touching the boards, and finally I actually found myself riding on the fence itself, as the speed was so high that it was impossible to keep on the track."

#### A Lucky Win.

"Well, I won the race, but only because my opponent's belt came off in the last lap. Even then he would

probably have won if he had not pulled up to put it on again, as he had a good lead and the impetus would have carried him over the line.

"I was riding a  $2\frac{3}{4}$  h.p. chain-driven Humber, and just before the race noticed that the rear tyre cover was worn through, but managed a temporary repair by binding the worst place with a silk handkerchief."

#### Speed in the Early Days.

Not many riders can have had a much more exciting ride than this, but Bert Yates told us several more anecdotes of races of almost as exciting a nature.

The speed accomplished in those early days by Bert Yates and certain other expert riders on the old  $2\frac{3}{4}$  h.p. chain-driven Humbers was little short of marvellous, and in some cases they put up records which would be hard to beat, owing to the fact that the tracks could not stand a higher speed.

### A NEW SIDECAR BODY.

A novel method of constructing bodies for sidecars and cyclecars was brought to our notice recently by Mr. H. S. Harvey, of the Light Car Body and Fittings Co., Coventry. Any shape can be made, and when the body is finished it has the appearance of having been shaped from a solid piece, as there are no visible constructional details or joints. The method of building is the invention of Mr. Harvey, and it results in a very strong body, at the same time it is lighter than the usual coach-built type, and the appearance is very good. The only framework used is that for fixing the door, and a light strip along the top where the upholstery is attached. The model which we illustrate has a detachable front and a seat for a child. The door fastener is strong, simple, and conveniently placed.

A sidecar body constructed in this way has much the same appearance as if it were made of shaped metal, to make which special and costly appliances are required; and unless a very large number of bodies were made of precisely the same shape, these appliances would make the cost prohibitive. Another advantage which a wooden body has over metal is the absence of clanging and rattle.

Mr. Harvey showed us a small model which was made some time ago and had been subjected to any amount of knocking about, but it had withstood the rough treatment perfectly, and when we examined it all its joints were quite firm.

Sidecar body of novel construction made by Light Car Body and Fittings Co. This method of building admits of any shape being made, and no framework is required.

### A Practical Suit of Overalls.

F. C. Noar and Co., 19, Watling Street, Shudehill, Manchester, have lately introduced a thoroughly practicable and quite nice looking suit of motor cycle overalls. It is made of good wearing material, and amongst the chief points may be mentioned the double protection for the shoulders, double-breasted front, and bishop's sleeves, which form a most excellent type of wind cuff. Loops are provided on the sides for a belt to prevent the coat from bellying out in a wind. The material is, we understand, absolutely stormproof. The leg portion of the suit has been carefully designed, and the portions which wear out so quickly—the straps underneath the foot—are made of double thickness. The fastenings are spring buttons.

The "Deluge" overall suit.

### Light Sidecar Jack.

A neat and very light sidecar jack is being marketed by Brown Bros., Ltd., 15, Newman St., Oxford St., W., which takes the form of a fork mounted on a telescopic tube. The fork may be raised to the necessary height, where it is locked by a simple jamming action, and may be released by pressing a spring-controlled trigger. When the stand has been set to the correct height, the sidecar axle may be lifted on to it or rolled into position. The substantial square base is turned down at the corners so as to grip the road surface and prevent rolling. This jack is absolutely firm when set in position, light in weight, and convenient in size.

Brown Bros. telescopic sidecar jack.

### A New Terminal.

The Rotax Motor Accessories Company, 43-45, Great Eastern Street, E.C., have introduced a new and simple terminal for electric cables. It is stamped in two halves, round one of which the stranded high tension wire is looped. The other half is then bent over and clipped down with the aid of pliers, making a safe and satisfactory job.

### A Handy Patch Press.

The Chemico patch press is a handy little contrivance which, when placed over a tyre patch, grips both patch and tube and dispenses with the necessity for holding the patch down with thumb and finger until the solution is dry. With the Chemico patch press an even pressure is distributed over the whole surface of the patch and tube, which pressure can be regulated to a nicety, and the appliance can then be clamped to ensure perfect adhesion.

In the case of one or more punctures requiring to be repaired, a patch can be placed in position and fixed with this press and a fresh repair can be prepared at the same time, as the hands are free for other work.

### Simple Spring Footrest.

A very simple and neat form of spring footrest has been invented by Mr. S. J. Heany, and will shortly be put on the

Heany's spring footrest.

market. It consists of a tubular hanger which may be fixed to the usual footrest bar at any angle. On the outside of this hanger, slides a case carrying a leather-covered footrest on a tubular extension.

The hanger is slotted, and a bolt passes through the sliding member from side to side, thus serving the double purpose of keeping the footrest in the correct position, and of forming a take off for two springs enclosed in the hanger. The lower spring takes the weight of the rider's foot and the upper acts as a recoil spring. Both are easily accessible. Spring footrests should have a good sale as many riders complain of hot feet, the result of vibration.

### New Kick Starter.

Wait and Co., Ltd., of Belgrave Gate, Leicester, are marketing a kick starter which can be adapted to almost any make of machine. A small pinion mounted on a free-wheel is fixed to an extension of the crankshaft on the timing gear side, and meshing with it

Wait & Co.'s "Clyde" kick-starting device.

is a large sector which can be rotated by a sharp kick on the pedal attached to it. Arrangements are being made to fit a free-engine clutch in conjunction with the device so that even out-of-date machines may be converted.

Five organisers of the Australian Workers' Union who travel throughout Australia on their L.M.C. motor cycles. These riders visit remote parts of the Commonwealth carrying their "swag" (about 150 lbs.) with them.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

### Bevel Gear Transmission.

Sir,—One of the arguments urged against the positive bevel drive, as exemplified on the four-cylinder F.N., is the danger in case of a seizure in the engine. I have experienced such a seizure (due to some screws of a big end coming adrift) when travelling at a speed of 35 m.p.h. by Cowey indicator. The back wheel skidded for 25 yards before the machine came to rest. The tyre was a 26 x 2½ Kempshall. The shock did not throw me over the handle-bars, the steering being somewhat affected, and was similar to travelling through sand.

My brother had a similar experience when travelling at 20 m.p.h., and he also experienced no difficulty in staying on the road, and kept his seat in the saddle. In both cases we were able to complete our journey (100 miles in one case and 40 in the other) by taking out the piston and connecting rod of the refractory cylinder. The roads had good firm surfaces.

It speaks very highly for the strength of the teeth on the bevel wheels that they can withstand shocks of this description. The bevel drive only requires very occasional attention, whereas belts when used in sandy districts require anything but occasional attention.

A. VALLMED.

### Bowden Wire Lubricator.

Sir,—I enclose sketch showing a little device for lubricating the flexible wires used for controlling brakes, throttles, etc. Being in the motor trade, I have noticed that a large number of flexible wires break owing to rust and unnecessary friction in the outer casings of these wires.

Of course the device would be placed at the highest point of the wire so that the oil would work down the wire.

It is easy to fit, as it is only necessary to cut a piece out of outer casing to allow room for the lubricator and slide lubricator on and replace the rest of casing.

ALFRED J. KETTLE.

### The Race for the Albert Brown Trophy.

Sir,—May I call your attention to an inaccuracy in the account given in your paper of the race for the Albert Brown trophy (July 11th, 1912, page 789), where it is stated that "C. Gordon Watson's F.N. looked like a winner, but something went wrong in the first lap, which put him out of the race." It was at the end of the seventh lap that something went wrong. I had, at that time, maintained my initial lead on the scratch cars and had passed the cars which started in front of me.

C. GORDON WATSON.

### Automatic Carburetters.

Sir,—I have been very much interested in the letters and articles on the above subject which have lately appeared in your columns, but I have been disappointed to find no reference to the behaviour of automatic carburetters when used on twin engines (especially lightweight twins). I understand that the problem of carburation is much simpler on a single, and that, while it is now well-known that the Binks, C.A.P., Lukin, Stewart-Precision, and others (to place them in alphabetical order) give excellent results on the standard 3½ h.p. 500 c.c. machine, it is not so certain that they would be equally satisfactory on a twin engine of 350 c.c.; at all events information on this subject is somewhat lacking.

The fact that the C.A.P. was fitted to the Forward, which was third in the Junior T.T., hardly applies to the case, for

the circumstances of this ride are very different from ordinary riding conditions. Personally, I consider the following points desirable: (1.) Slow steady running without missing both on the level and on hills. (2.) Quick pick-up without knock or jerk after slowing down for traffic. (3.) Good hill-climbing power and fair pace when required. (4.) Satisfactory petrol consumption and a cool engine. I shall be glad to hear if any of the carburetters mentioned can be relied on to give these desiderata.

SOCRATES.

Sir,—As an interested watcher of the tardy improvement of our motor cycle carburetters, may I add a few words of criticism on the letters that have appeared.

I think that every rider of a single-gear motor will agree that the extremes of engine speed of the cycle are far greater in every ride that one takes than they are once in a blue moon in a car engine. That the car engine with its four cylinders can turn round at a crawl no one doubts, but it does not do so as a rule in actual driving, and has not to do so per force. For speed, in goes the top gear; for starting and for hills, the engine speed is pretty constant on the lower gears.

I have read the correspondence on the subject of multiple jet carburetters, and am now quite convinced that at starting, and perhaps when the second jet has just come into action, the correct mixture may have been obtained, and that at every other position of the throttle the mixture must be much too rich.

Let us have some consumption tests of automatic carburetters quoted by the satisfied users. 100 miles per gallon for a 3½ h.p. is none too good, the average should be well over that to be an improvement on older types.

The use of the word "suction" is, I think, confusing, and there is no need to confuse the average motor cyclist, if one may judge of his knowledge by the letters that are published.

I should like to know why we should have the complication of inlet valves with variable lifts, when the throttle can, and does, exactly the same.

The rush of air into the cylinder is dependent on three things only: The vacuum in the cylinder, the atmospheric pressure, and the opening of the throttle. The petrol taken in depends on the rush of air past the jet (and, of course, size of jet, petrol level, and size of the choke tube), but these are secondary. It is the rush of air caused by the pressure of the atmosphere that carries up the petrol, and the opening of the extra air lets in air that does not carry up petrol and reduces the strength of the mixture, and also reduces the rush of air past the jet, thus reducing the strength in two ways; and it is this double reduction of the strength of the mixture that makes it necessary to close the extra air when speed is reduced. A simple experiment made me quite sure that nearly all carburetters are wrongly made to obtain what is wanted, viz., a spray. With a few bits of glass tubing and a cork and a glass of water one can see that a solid column of water is taken up by blowing past a jet of the ordinary form, and that by blowing water with two tubes at an acute angle, like a scent spray, the finest spray is obtained. I am quite sure that in future we shall either have some gas-making plant, that is not thought of now, or we shall have the petrol atomised by currents of air across the jet, in addition to some air from below as at present. I have greatly improved the running of my Triumph by soldering up the extra air holes and making one large hole in their place, which has a pipe soldered on parallel with the inlet to the cylinder, the pipe having a dust excluding gauze at the end. Warm air is taken in with less dust and the blow-back petrol is trapped.

ACORN.

### Oily Engines.

Sir,—I have been an interested reader of your paper for several years and also an enthusiastic motor cyclist.

I have just bought my 1912 mount with a popular make of engine, and I cannot let this opportunity go without complaining bitterly about the "oil slinging" propensities of this particular make, and, I believe, others. They are acknowledged by the makers to be, as they termed it, "oily engines." They have had it back, but it is still no better. This is a state of things which ought to be altered, as it is impossible to ride the machine without overalls. Felt washers have been put on the mainshaft behind the pulley, but the flow of oil never ceased. I should like to hear other riders' experiences on this subject, as it strikes me as being a very important point.

"Ixon" in his notes remarked about manufacturers fitting covers over the enclosed waterproof magnetos, and held the manufacturers up to ridicule for doing so. I had occasion to be riding when it was raining very heavily, and my machine started misfiring and stopped, and when I took it to the nearest garage, we found that there was water on the magneto. I thought that this might have been a misadventure, but two of my friends have also had the same trouble with their 1912 instruments, so it seems that covers are still necessary. I might say that the washers between the end covers and magnets were intact when they were taken off.

GROWLER.

### "The Motor Cycle" Formula in South Africa.

Sir,—Enclosed you will find a cutting from a local sporting paper, which, I think, will prove a source of amusement to you, in particular the interpretation by the writer-expert (?) of *The Motor Cycle* hill-climbing formula.

I would like to suggest that next time you publish a formula, instead of using letters only, you print the words in full, so that there can be no danger of our experts interpreting

D to mean distance.

S to mean sideslip.

T to mean tractive resistance.

W to mean wheelbase.

You will see that three versions of your formula are given in the same issue of the paper in question.

$$1. \quad \frac{D^2 \times T^2 \times S}{W}$$

D = distance.

S = speed.

T = cubic capacity.

W = total weight.

$$2. \quad \frac{D^2 \times T \times C \cdot C^2}{W}$$

D = distance.

T = time of ascent.

C.C = cubic capacity.

W = total weight.

And 3, the correct formula:

$$\frac{D^2 \times S \times T^2}{W}$$

D = diameter of cylinder.

S = stroke.

T = time.

W = total weight.

This last was given by a dissatisfied sidecar competitor, who looked up the back numbers of *The Motor Cycle*.

Johannesburg.

THERMOS FLASK.

### Two-stroke Engines.

Sir,—I have read, with interest, your remarks on two-stroke engines, and, having studied and experimented with them, I think the time is ripe for good two-cycle engines. You state that the system enables very light reciprocating parts to be used, but in this I think you are not quite correct, though I admit it is in no way detrimental to the two-cycle engine. If you consider a two-cycle engine, and that it should, for any reason, misfire, the next explosion is of an exceptionally full charge and the pressure is very considerable indeed—in fact, it may considerably exceed that of four-cycle engines. Petrol engines, though so common, are by no means well understood, and the two-cycle engine, being more simple, will probably be found more reliable in the users' hands. So many four-cycle engines are

B4

ruined by "grinding in the valves" and mounting up the internal flywheels out of alignment—even  $\frac{1}{1000}$ th of an inch is serious in this case.

It is in the best interests of the popular motor press, I think, to decrease the cost of motoring and motor cycling, and it will be found that two-cycle engines are not only more reliable, but are cheaper to produce power for power. It is power not piston displacement, much less "bore," which is wanted, the power to turn the wheel round.

A. E. PARNACOTT.

### Combined Chain and Belt Transmission.

Sir,—With regard to "Ixon's" remarks in issue of 11th inst. regarding combined chain and belt transmission, I am afraid I must contradict him.

I do not see how Messrs. Douglas can be credited with "the solution of the transmission problem," as I have a twin sidecar machine, built by W. W. Fenn, now running in its fifth season, which has a Fafnir counter-shaft, two-speed gear and free engine driven by chain from engine and geared 2 to 1, and then by belt from a 9in. pulley to back wheel; I agree that the large pulley does away with belt trouble.

The Fafnir gear is absolutely foolproof and ran without a single adjustment for four years, and was only taken down this year for two new brakes.

SATISFIED.

### A Roadside Repair.

Sir,—I thought the following might interest some of your readers as a tip for a roadside repair. After finishing an eight days' tour round North Wales, I had arrived within seven miles from home, when the petrol tap on my friend's Clyno began to leak, and in tightening it up I turned it clean out of the tank, causing a dangerous stream of petrol to pour out over the hot engine. I used my finger as a plug, after which I procured a good cork, tapered it down, pushed a hole through the middle, got a clay pipe, broke off the stem, and inserted it in the cork. Then I cut off three inches of the gas lamp tubing, and slipped it on the pipe stem and over the feed pipe.

R. RYMAN.

### Modernising an Old Pattern Mount.

Sir,—I am sending you a photograph of a 1906 chain-driven Humber which I have just modernised. As an amateur, at such an undertaking, I am very pleased with the results. I have, of course, added new magneto and carburetter. The magneto is a Simms, and the carburetter

The 2½ h.p. modernised Humber motor cycle referred to.

a B. and B.; being able to vary the jet ensures one getting in all weathers the very best results from the engine. I meet with no hills that I cannot climb; I do not get badly left by any of the modern 3½ h.p. motor cycles, consumption is about 100 m.p.g., and I hope to do better. The idea of such extensive alteration would not have suggested itself, but for the fact that the engine is still, after years of constant running, in perfect order and good for another six years.

C. W. WILLIAMS.

## OPEN HILL CLIMB AT CAERPHILLY.

A. B. Wade (6 h.p. Zenith and sidecar) rounding the top bend in the hill-climb at Caerphilly, in true racing style.

**I**DEAL weather favoured the hill-climbing tests organised jointly by the South Wales Automobile Club and the Cardiff Motor Club, and held on Thursday, the 18th inst.

Few better spots in Wales could have been found than the mountain road leading from Caerphilly to Cardiff. The course was over a route of 3,582 feet, the total rise being 387 feet, the average gradient 1 in 9.2, and the steepest part 1 in 6.2. Mr. A. V. Ebbelwhite, of the Royal Automobile Club, filled the capacity of starter.

There were some rather dangerous bends in the road, but these were negotiated with great skill, and the proceedings were unmarred by any serious mishaps, despite the fact that very much faster times were recorded than in last year's events.

The start was made soon after eleven o'clock, the first event being for touring machines, with cylinder capacity not exceeding 350 c.c.

J. F. Crundall (Humber) went off in fine style, the healthy bark of his 2½ h.p. engine attracting no little comment from the spectators. F. W. Barnes (Zenith) won this event on formula, taking 1m. 58½s. H. C. Newman (Ivy-Precision) found second place in 1m. 26s.

In the second class for Tourist Trophy machines, H. Britton (Douglas) finished first in 1m. 20½s. In the single-cylinder racing machine section, G. Clarke (Rudge) suffered bad luck in sustaining a dry skid, and falling off his machine when almost at the top of the hill.

The event looked forward to with most interest was the open contest for all comers, with unlimited capacity. This class was full of surprises. R. M. Lewis (¾ Premier) finished first in the exceedingly short time of 1m. 11½s., beating Barnes by ½s. This was a particularly wonderful performance, as Lewis, who is practically a novice, was riding a stock machine, only received from the works two days before the tests.

Barnes would have undoubtedly won the sidecar class had he not suffered ill luck at the last bend, bursting a tyre, but riding to the top of the hill on the rim, he gained third place.

The twin-cylinder, capacity not exceeding 1,000 c.c. competition, for members only, was won by W. Phillips (5 Kerry-Abingdon), who accomplished the climb in 1m. 24½s. A peculiarity of this event was that the two Kerry-Abingdons entered completed the course in precisely the same time, gaining first and second places on formula.

CLASS I.—Touring cycles not exceeding 350 c.c. (open).  
Determined on formula.

	Time.
1. F. W. Barnes (2½ Zenith) ...	1m. 58½s.
2. H. C. Newman (2½ Ivy) ...	1m. 26s.
3. J. J. Mathias (2½ Humber) ...	1m. 26½s.

CLASS II.—T.T. machines not exceeding 350 c.c. (open).  
Determined on time.

1. J. Parsons (2¾ Douglas) ...	1m. 20½s.
2. F. W. Barnes (2½ Zenith) ...	1m. 27½s.
3. H. C. Newman (2½ Ivy) ...	1m. 29½s.

CLASS III.—Touring standard cycles not exceeding 600 c.c. (open).  
Determined on formula.

1. V. Taylor (¾ Rudge) ...	1m. 13½s.
2. C. T. Newsome (¾ Rover) ...	1m. 11s.
3. W. D. South (¾ Rudge) ...	1m. 15½s.

CLASS IV.—Racing single-cylinder machines not exceeding 500 c.c. (open).  
Determined on time.

1. C. T. Newsome (¾ Rover) ...	1m. 11s.
2. H. Wessendorf (¾ Premier) ...	1m. 12½s.
3. W. G. McMinnies (¾ Triumph) ...	1m. 14½s.

CLASS V.—Racing twin-cylinder machines not exceeding 500 c.c. (open).  
Determined on time.

1. H. Britton (3 Pioneer) ...	1m. 15½s.
2. J. J. Mathias (2¾ Humber) ...	1m. 28½s.
3. C. R. M. Peatty (2¾ Douglas) ...	1m. 33½s.

CLASS VI.—Touring twin-cylinder machines not exceeding 480 c.c. (open).  
Determined on formula.

1. A. V. Shirley (7 Indian) ...	1m. 15½s.
2. E. Chapman (6 Zenith) ...	1m. 26s.

CLASS VII.—Unlimited capacity (open).  
On time.

1. R. M. Lewis (¾ Premier) ...	1m. 11½s.
2. F. W. Barnes (8 Zenith) ...	1m. 12s.
3. W. G. McMinnies (¾ Triumph) ...	1m. 12½s.

CLASS VIII.—With sidecar and adult passenger (open).  
Capacity unlimited. Determined on formula.

1. — Burrelli (6 Zenith) ...	1m. 23½s.
2. E. Chapman (5-6 Zenith) ...	1m. 31½s.
3. F. W. Barnes (8 Zenith) ...	1m. 24½s.

CLASS IX.—Standard touring machines not exceeding 560 c.c. (Members' class.)  
Determined on formula.

1. J. J. Mathias (2¾ Humber) ...	1m. 41½s.
2. R. W. Jones (¾ Rudge) ...	1m. 34½s.
3. C. Hinton (¾ Scott) ...	1m. 24½s.

CLASS X.—T.T. machines (members only) not exceeding 500 c.c. Determined on time.

1. H. Wessendorff (¾ Premier) ...	1m. 15½s.
2. J. C. Moore (¾ Rudge) ...	1m. 15½s.
3. F. J. Tanner (¾ Triumph) ...	1m. 16½s.

CLASS XI.—Two-cylinder machines not exceeding 1,000 c.c. (Members only).  
Determined on formula.

1. W. Phillips (5 Kerry-Abingdon) ...	1m. 24½s.
2. T. C. Owen (5 Kerry-Abingdon) ...	1m. 24½s.
3. E. Chapman (5-6 Zenith) ...	1m. 20½s.

Group of competitors in the Lincolnshire M.C.C. Speed Trials at Thonock Park. Sir Hickman Bacon is standing in the centre.

# Climbing Snowdon by Motor Cycle.

INCIDENTS OF THE REMARKABLE ASCENT OF SNOWDON ON A MOTOR CYCLE.

- (1) A comparatively easy section.
- (2) L. W. Spencer and his Rover with some of the witnesses.
- (3) Passing through a gap in the wall near the summit.
- (4) The fast few yards.
- (5) Just before reaching the fourth gate.
- (6) Nearing the summit. Notice the precipice on the left; the hotel at the summit is seen in the background.
- (7) Lifting the machine over a rocky barrier.

THE ascent of Snowdon has been accomplished successfully, as mentioned in our last issue, by L. W. Spencer, of Uxbridge, in spite of the many and great difficulties encountered. The start was made from Llanberis at 8 a.m. on the 13th inst. At first the surface of the road was good, and although very steep, it was surmounted without difficulty. However, after passing through three gates, Spencer and his friend Gilbert Brooking found that the road had practically disappeared, and they found themselves on a steep path of fair width covered with stones. Soon the path became worse, but Spencer mounted it steadily, and after a couple of bad turns stopped to wait for his friend who had gone back for a second attempt. When he presently arrived they started on the clutch, and gradually worked their way upwards over a loose rock-strewn track, covered here and there with sodden grass and pools of water. The driving wheels were unable to obtain a proper grip, but progress was made slowly. Then came a mass of rocks over which the machines had to be lifted. The track was now actually a river bed, the water being in places as much as six inches deep, and patches of wet clay added to the difficulties of the riders; in addition, the belts began to slip.

After the half-way house was passed the going was better for about a mile. Here a stop was made for lunch, and gears were lowered as far as possible, giving a 13 to 1 ratio on the lowest speed. The engine now had power in reserve, but the clutch began to slip, and it was a case of pushing behind by Brooking and Wade (the photographer) until a rocky barrier was reached where the machine had again to be carried.

The track now passed under a railway bridge, and for a few yards had a 2,000 feet precipice on one side with the railway rising abruptly on the other.

A little later the machine was dragged on to the railway

track, and though the gradient was still very steep, the machine made light work of the ascent, as the surface was better, and the summit was reached at 3 p.m. Owing to lack of time Brooking regretfully decided to abandon the attempt to get his machine up as well.

Spencer's machine was a new drop frame  $3\frac{1}{2}$  h.p. Rover, fitted with a Sturmey-Archer three-speed gear, Pedley  $2\frac{1}{2}$  in. tyres, a Pedley belt, and extra heavy spokes. Brooking rode a standard  $3\frac{1}{2}$  h.p. Rover with Armstrong gear.

Essex M.C. and Walthamstow M.C. Gymkhana. The start of the Car and Sidecar Flower Race. The machines are a G.W.K., Indian, and Scott

### The Wall Four Wheeler.

## TWO NEW CYCLECARS.

**L**AST week we had the opportunity of examining a neat four-wheeled cyclecar, which will be built and marketed by Wall Cars, Ltd., of Tyseley, Birmingham. The new company is being formed so that the manufacture of this cyclecar may not interfere with the work in hand at the present factory of A. W. Wall, Ltd. Two models are being built, a 6 h.p. twin and a  $4\frac{1}{2}$  h.p. single, both fitted with Precision engines. The twin has a two-speed and reverse gear box, the changes being made by means of pedals. From the gear box, the drive is transmitted to a live rear axle through a universal joint and a propeller-shaft which is enclosed in a stout torque tube. The chassis is particularly simple, and consists of straight-channel members suspended from the axles by curved leaf springs. Radius rods prevent the front axles from moving out of line. Steering is direct, and operated by a large wheel. A band brake is fitted to each rear wheel, and the foot brake acts on the gear drums. The body is suspended from the chassis on long leaf springs extending the full length of the coachwork, and is of comfortable proportions. Everything is made weather-proof and accessible, and engine adjustments can be made by merely swinging back the hinged dummy radiator. A novel feature is the method employed for starting. At present we are limited to saying that the device fitted enables the engine to be started from the driver's seat with the minimum of effort. The magneto is gear driven and placed in front of the engine, and an Amac carburettor supplies the gas.  $26 \times 2\frac{1}{2}$  in. tyres are fitted throughout. The gear ratio is 5 to 1 on top, with a 50% reduction for both low speed and reverse. The gear box is a particularly neat piece of work, following the well-known Roc epicyclic design, and is geared down from the engine, the whole gearing being enclosed in an aluminium box. Substantial mudguards combined with a running board, though not shown in the illustrations, add considerably to the pleasing appearance of the vehicle. The price is to be below £100, but realising that many people would be content with less speed, at a small cost, a single-cylinder type will be marketed, and we inspected one of the smaller machines in the course of erection. The engine and gear unit are the same as that used in the Wall three-wheeler (as already described in this journal), no reverse being fitted, and it is fitted in a channel steel frame suspended on four

The new Wall cyclecar, with its designer, Mr. A. W. Wall, at the wheel.

quarter elliptic springs; the body is not sprung from the chassis, but in other respects the smaller machine closely follows the lines of the twin. The top speed gives a ratio of  $5\frac{1}{2}$  to 1. The design struck us as being very practical, and there should be a good future for such a sound machine at such a moderate price. Correspondence regarding these vehicles should be addressed to Mr. A. W. Wall, The Laurels, Lynden End, Sheldon, near Birmingham.

Springing of twin Wall cyclecar, showing radius rod for front axle.

### The P.D.A. Cyclecar.

Messrs. Pickering, Darby, and Allday, of the Belgrave Garage, Bristol Street, Birmingham, have constructed a very neat and ingenious cyclecar, which in its preliminary tests has given excellent results. The motive power is a twin Blumfield engine of  $80 \times 95$  mm. bore and stroke, fitted with a large auxiliary outside flywheel, which also serves as the outer clutch member.

The patented suspension of this machine is rather unusual, as it may be said that the engine, rear axle, and gear box are rigidly connected. On the rear live axle is mounted a two-speed and reverse gear box with gears of the sliding type; and leading from the front of the gear box is a stout torque tube, which encloses the propeller-shaft. The front end of this tube is rigidly attached to a sub-frame carrying the engine, and this frame is slung in front from a circular cross member of the main frame; thus a straight drive is ensured, and universal joints are dispensed with. The whole engine moves when a road bump is met, but so slightly that no ill effects arise, the actual movement being equal to 1.64 in. when the road wheels rise 3 in.

A light T-section frame is used to carry the body, and is suspended on a single cross spring in front and two elliptic springs at the rear. The gear box is fitted with Timken roller bearings, and the road wheels with Hoffmann

Side view of the 6 h.p. twin-cylinder Wall cyclecar showing method of springing.

### Two New Cyclecars.—

ball bearings. The gears are beautifully cut, and run very silently, the ratios obtainable being 4.7 to 1 and 9.7 to 1, while the reverse gives 11 to 1.

The clutch is of the leather-to-metal type, and when it is withdrawn a further movement of the pedal applies expanding brakes in the rear wheels; a similar pair of brakes, also in the rear wheels, can be applied by a hand lever.

A light metal body is fitted with tanks to contain three gallons of petrol and three quarts of oil. A Best and Lloyd drip feed lubricator, placed under the scuttle dash, is employed to lubricate the engine. A Simms magneto is fitted, and probably a Lukin automatic carburettor will be standard.

Steering is direct, actuated by a wheel, and the steering column may be set to any angle to suit the driver's convenience.

The design is unusual, but good, and the workmanship excellent in all important parts. We hear that the P.D.A. cyclecar may shortly be seen at Brooklands in connection with an important event.

Three-quarter front view of the P.D.A. cyclecar.

## ENGLISH-DUTCH TRIAL.

ONCE again we would urge the British teams to apply to the R.A.C. for their international passes and tickets at once, otherwise there will be difficulty in reserving the necessary accommodation on the train and boats. As little would be gained by making up a Midland party, it has been decided that all meet at Liverpool Street Station, London, in time to catch the 4.10 p.m. boat train, to which a special van or vans will be attached for the competitors' motor cycles.

Competitors are requested to note the following points: Price's oil will be provided for English riders at Amsterdam, but they are requested to leave oil in their tanks when embarking at Harwich, so that they may have a supply with which to ride to that place.

Riders are expected to arrive in Holland with English flags on their machines. The Dutch national colours will be presented to them on arrival.

Competitors will be entertained at dinner, lunch, etc., as the guests of the Nederlandshe Motorwielrijders Vereening, but passengers will be expected to pay for meals.

The Hare Hotel is in Dutch Hotel Net Haasje:

It is impossible to divide kilometres exactly into miles, but the error on the cards when present will be very small, and there is a time allowance of fifteen minutes.

### Points concerning the International Trial.

In connection with the trial itself, the arrangements for its control will follow closely English ideas. The route cards giving distances with spaces for times at the different

controls and checkers' signatures, will be printed on stiff linen. Competitors also sign their names on the checkers' sheet. The route will be shown in detail on stiff cardboard, and an illustration of the different international warning signs also appears for reference purposes.

Dangerous places on the route are marked O before the name, and the Dutch M.C.C. have further engaged several men who will show, by means of the Dutch flag (red, white and blue), the right way to take. In the district where the wrong road might possibly be taken, viz., between Opeldoorn and de Steeg, the route will be arrowed.

The Dutch officials are wise enough to realise that constant reference to the route card might lead to an accident, seeing that the rule of the road is "keep to the right," so the main instructions will be clear if each competitor keeps his eyes on the road. Further, the whole route is marked by name and distance signposts of the Touring Club of Holland.

Corners in Holland are usually sharp and consequently dangerous, but no mistake can occur if caution be exercised. Special care should be taken in riding through towns, as motor trials are infrequent in Holland, and it is desirable to create a good impression.

The times will be taken at the actual checking stations, which will always be clearly marked by notices and the display of the national colours. Several competitors have asked if it is really necessary to take over evening dress for the official dinner, seeing that luggage is such a nuisance on tours of any kind. We approached Mr. Citroen on the matter, and he considerably replies that the competitors may please themselves entirely. The council and the N.M.V. and the other officials will be in evening dress, but it will not be considered a breach of etiquette if the teams appear in morning dress. The actual teams are now definitely fixed, and their names will be published in the next issue of this journal.

The P.D.A. cyclecar engine, showing method of suspension, etc.

### LINCOLNSHIRE M.C.C. SPEED TRIALS.

The results of the Thonock speed trials, held on Saturday last, by kind permission of Sir Hickman Bacon, were:

#### CLASS 2.

		Time.	Formula.
1.	W. J. S. Bament (3½ Rudge) ...	34½s.	... 60
2.	J. H. Brookes (3½ Rudge) ...	37½s.	... 77
3.	J. E. Harston (3½ Champion) ...	40½s.	... 80

#### CLASS 3.

1.	L. Wachter (6 Zenith) ...	34½s.	... 74
2.	L. W. Forington (7 Indian) ...	32½s.	... 90
3.	B. Rhodes (6 Zenith) ...	36s.	... 91

L. W. Forington (7 Indian) made fastest time of the day. The course was 1,000 yards in length, with a good surface. Sir Hickman Bacon very kindly entertained the members to tea.

# What we H

## Mr. Harry Long completes his ride round

# SINGER

## with sidecar

*The route covered by Mr. Long, 5,128 miles.*

Mr. Harry Long, riding a 4 h.p. Two-speed SINGER with sidecar and passenger and full touring outfit (the whole weighing about 780 lbs.), has completed his great coast ride, having now covered 13,563 of the 20,000 he has determined to do within six months, without a single involuntary stop or the slightest mechanical trouble.

During his ride Mr. Long has found it necessary to climb some of the worst hills, and traverse some of the most badly-made roads in Great Britain.

The ease with which Mr. Long has accomplished his most severe task fully justifies the faith he placed in the SINGER, and proves once again what a truly wonderful machine it is.

The SINGER 4 h.p. model with the reliable Two-speed gear is a machine worthy of your confidence. Would you like to know more about it before deciding on your new mount?

**Let us send you our Catalogue.**

# Scottish Six Days Reliability Trials

Edinburgh, Saturday, July 20th.

**O**WING to the large number of entries (seventy-five) two alterations have been made in the route, the selected hotels being unable to accommodate so large a crowd. John-o'-Groat's will not be visited, the inland cross road to Thurso being preferred, and Amulree Hill has, unfortunately, been deleted, owing to hotel troubles. This famous ascent will, however, be tackled from the Kenmore side next year.

The 3 h.p. twin-cylinder J.A.P. engined three-speed Hazlewood, which is being ridden by F. Begley.

## Entries for Team Prize.

The following are the entries for the team prize:  
 L.M.C.—N. Soresby, H. Bevir, and H. E. Wace.  
 Bat.—J. D. Morrison, P. E. Toliree, and S. J. K. Thomson.  
 Humber.—A. G. Fenn, W. Creyton, F. G. Edmond, and B. Yates (nominated from).

Rover.—G. E. Whitehouse, A. J. Sproston, and C. T. Newsome.

Douglas.—W. B. Gibb, G. L. Fletcher, and A. H. Alexander.  
 Bradbury.—W. Houghton, H. Gibson, and C. W. Meredith.  
 Rudge.—G. T. Gray, V. Taylor, J. H. Begg, and G. Taylor (nominated from).

Quadrant.—A. A. Hay, T. Silver, and L. E. Cass.  
 Indian.—J. R. Alexander, G. E. Cuffe, and B. A. Hill.  
 New Hudson.—G. Bell, H. G. Dixon, and H. Berwick.  
 Premier.—W. B. Little, R. Holloway, and J. Oliphant.  
 Ariel.—F. C. North, L. Newey, and A. F. Downie.

There are no marks or timings for the hill-climbs, the ascents being so formidable that a man is held to have performed with credit if he reach the next control in schedule time, but performances on the following climbs will be "observed," and taken into account in the awards for all the special prizes.

## Observed Hills.

First Day.—Rest and be Thankful.

Second Day.—The Devil's Elbow (up to Cairnwell Summit, the highest main road in Great Britain). Rinloan (a piece of very bad going, with an awkward start). Cockbridge (a combination of hairpins and gradient, perhaps the stiffest ascent in the trial). Bridge of Brown.

Third Day.—Eriboll (a new hill to trials competitors, with excellent surface, terrific gradient, and three acute bends). Hill near Hope (a quarter of a mile dead straight, so steep that a racing 7 h.p., with flying start, can barely top the crest). Appagill (covered with loose stones a foot deep; the hill on which Fred Dover failed eighteen times on his coast ride, his machine being hauled up by a donkey).

Fourth Day.—Berriedale (the south side, not previously ascended in any trial; long and steep).

Fifth Day.—Little Gruinard (loose and bad turn at top). Poolewe (not very difficult). Glendoe (long, steep climb).

The competitors check at the summit of Eriboll, and then return down the hill, as attempts to arrange for ferrying on the far side have broken down. There is likely to be some confusion here, with seventy-five competitors ascending and descending a very twisty hill; as the day's ride amounts to 211 miles, it may not be feasible to arrange an hour's wait at the summit.

FIRST APPEARANCE OF THE 1913 MODEL THREE-SPEED CLYNO.

- 1) Rear view showing the two detachable and interchangeable wheels shod with 3in. Pamer tyres.
- 2) Front view showing new design coach-built body. Frank Smith is driving the machine in the Scottish Trials.

### The Scottish Trials.—

The road reports are not very encouraging. Roads near Drumnadrochit, Rinloan, and Laing are announced to be in process of repair, and almost impassable. Yesterday a large car shed its engine attachment bolts in trying to negotiate a two-mile stretch near Laing. Altogether, some of the English trade entrants are likely to receive eye-openers both in respect of bad going and of gradient.

Sunday, July 21st.

Hanover Street, outside the rooms of the Edinburgh and District M.C., presented a remarkably busy scene this afternoon, when most of the competitors presented their machines for labelling.

The trials are run in a very free and easy fashion, and the machines are not sealed in any way, the remote and desolate character of the places visited rendering substitutions impossible. Most of the entrants presented themselves, and some of the machines were of exceptional interest. A centre of attraction was Frank Smith's 1913 Clyno sidecar, shod with 3in. tyres on all wheels, both cycle wheels and the sidecar wheel being detachable in half a minute and interchangeable. The Clyno is further fitted with an experimental gear box, affording three speeds by a sliding key.

Talking of gears, there were probably more Armstrong hubs to be seen in Hanover Street than have ever been collected together before outside one maker's stores. W. Creyton appeared with his Junior T.T. Humber. If he earn a gold medal, who shall dare to say that the Manx machines are not roadsters? At least two riders hope to get through on single gears. P. E. Tolfree has transferred his overhead valve J.A.P. engine from a Matchless to a Bat frame to complete the Bat team. His lowest possible gear ratio is 5 to 1, but he

has one of the new Morrison pilot jets fitted, with the aid of which he says the machine can lug itself up any gradient. This device, which we illustrate, is fitted midway between the engine and the carburetter, and consists of a small brass

By-pass jet fitted to P. E. Tolfree's Bat-Jap.

A. Inlet pipe. B. Adjuster. C. Lock nut. D. To cylinder.  
E. Jet. H. Holes opening into inlet pipe. F. To carburetter.

tube which vertically bisects the inlet pipe. This small tube is open to the air at its lower end, and closed at the top end by a conical ended adjuster screw. It communicates with the inlet pipe by two holes drilled through its centre.

### INCIDENTS OF THE IRISH END-TO-END TRIAL (described in our last issue.)

- (1) A bird's eye view of the competitors at the Dublin Control.
- (2) Hugh Gibson (Bradbury) at the Dublin Control. He did very well in the trial, but ran short of petrol when in sight of the end. He had given the contents of his spare tin to a stranded competitor.

- (2) Early arrivals at the Control at Cork.

- (4) Miss Hind leaving Cork on her 6 h.p. twin Rex.

A. J. Sproston astride the  $3\frac{1}{2}$  h.p. three-speed Rover which he is riding in the trials.

capable of being partially covered by the aforesaid adjuster screw. The pilot jet is centrally mounted inside this tube, and receives its petrol *via* a small separate pipe from the main carburettor float chamber.

Several of the competitors have belt shields fitted in view of the Highland rainstorms. Those on W. D. South's Rudge look particularly effective. Two of the sidecarists are essaying extremely herculean tasks. P. W. Bischoff is taking round the only lady motor cyclist winner on Brooklands, Miss Beatrice Langston, and in practice they found that the ratios of their three-speed Triumph were a shade too high for the worst hills, so they wired for a Sturmev-Archer Triumph, which arrived late last night, and have spent the interval fitting the old engine in the new frame, Miss Langston proving herself quite an expert as mechanic and chauffeur. Miss M. Hind brought up her new twin Rex fresh from its Irish victory in the End-to-end trial.

#### A Start in Bad Weather.

Monday, July 22nd.

The weather was unpromising at the start this morning, for a sea soaker in drizzle came up the Forth at daybreak. Several competitors sustained heavy falls on the greasy tramlines in their two-mile ride out to Murrayfield car terminus, where the trial actually began. The non-starters were H. Bevir (L.M.C.), H. E. Ware (L.M.C.), Chas. Fraser (Campion-Precision), J. R. M. Larnach ( $3\frac{1}{2}$  Kerry-Abingdon), making seventy-one starters. The L.M.C. team thus fell through. N. Soresby's machine had a new gear designed by Mr. Lloyd with belt for high ratio and chain for the low. Hutchison (Rex-Jap and sc.), withdrew as his machine was delayed on the railway from Coventry.

P. W. Bischoff was nearly late at the start. He finished transferring his old engine to the new frame late on Sunday evening, and en route to Murrayfield for the official start: he was several times delayed, his magneto timing wheel shifted, and a plug sooted.

Rain fell steadily throughout the preliminary preparations and at eight o'clock precisely the first quartette departed on their arduous task. The entry was effectively strung out by starting in fours at two-minute intervals. As a foil to the forthcoming scenery and precipices, the Scottish trial always starts with ugly level districts, and everybody was glad when Stirling, the first check, was reached. A competitor said that if Scotland is the land of cakes she got them for her pot-holes. Worse was to come. The valley road striking west towards Loch Lomond was like corrugated iron and the lakeside road was much rougher. There was no question of leaning in or leaning out on corners, for the trouble was to keep the machines on the road at all. Leaving Loch Lomond, we cut across the neck of a narrow peninsula and lunched at Arrochar, on the shore of Loch Long. The men were all well up to time, and a few punctures were the only troubles reported. The afternoon route rounded the

head of Loch Long, crossed over Rest and be Thankful to Loch Fyne, passing Inveraray Castle, then hugged the loch side to Lochgilphead and along the sea coast into Oban. There is no finer scenery in the kingdom. We were glugged with continuous panoramas of lake and peak and forest, whenever the pot-holes and innumerable blind corners suffered us to glance off the road. On one stretch there were actually twenty hidden hairpins in a single mile.

However, motor cycling interest centres on the climbing of Rest and be Thankful. It is an unusual hill. The real climb consists of 100 yards of 10% gradient, an easy bend and a bad bend, but the preface of the hill includes seven miles of gentle collarwork, and many riders tackle this on full throttle so that engines are plum colour ere the bad bit is reached. Thanks to variable gears, only three or four men were short of engine power, the contrast with previous years being strongly marked.

#### The Ascent of Rest and be Thankful.

The conditions were ideal, a gentle cooling wind blowing across the road and light sunshine, the rain having been left behind in Stirling. The road surface was simply magnificent up to the bad bend, and was smooth round the corners for anybody who swung wide, but the inside of the hairpin was a mass of 4in. granite chunks. Clean ascents were few and far between, being largely confined to the men who had competed in previous years. The others took the corner close in, where the stones lay deep on a 1 in 3 grade, and they mostly paid the penalty. Owing to the miserable numbers provided it was very difficult to identify the riders, especially if they arrived in clumps. The first man up was Angus Macmillan, who purred round in clean style on his Scott. Thompson, mindful of his sidecar breakage on this corner in 1910, swung round gently. McMinnies (Triumph) stopped far below. Viewed through the telescope, he appeared to be lowering his single gear. Finally, he came up well. Pratt (P. and M.), was good; Sproston (Rover) seemed to have 3 h.p. in hand; Creyton ( $2\frac{1}{2}$  h.p. Humber) stuck in the stones; Steel (B.S.A.) fell twice, each time baulking one rider, first Holroyd (Motosacoche) and then Alexander (Indian); C. T. Newsome (Rover), Fenn (Humber), J. Morrison (Bat), and Chisholm (James) were all good; Hugh Gibson roared up on his Bradbury sidecar as if he were on the test hill at Brooklands. When he cut in the stones threw his gearing out, and his frightened passenger forgetting to lean out, he nearly took the ditch, but just cleared it, and scraped up by clutch manipulation. Returning, he laughed to see how simple the corner is when you have seen it. Munro (Douglas), fell and Keiller's Rudge was brought over by the recumbent machine.

At Keiller's second attempt, White (Alldays) played him a similar trick, but he got up next time with the aid of

Mrs. H. J. Woodgate, who is the latest convert in Leicester. She rides a  $2\frac{1}{2}$  h.p. two-speed Douglas.

### The Scottish Trials.—

much legging. F. S. Douglas (Dot) fell and balked Alan Hill (Indian); the Clyno negotiated things well; Soresby (Rudge) was helped by a lucky skid; Vernon Taylor (Rudge) good; Brough performed an absolutely circular skid, went down and lowered his single gear, and came up again easily; Alexander (Douglas), Pratt (Aldays), Westwood (Triumph), Morrison (Bat), Lord (Rex), W. Downie (James), Mundy (Macbeth), Little (Premier), Downie (Ariel), Meredith (Bradbury), Gray (Rudge), all creditable. Holloway (Premier) made perhaps the best climb of any stranger to the hill. W. Gibb (Douglas) performed a cakewalk in the stones, so baulking Silver and Cass (Quadrants), who were hard on his heels. H. Berwick (New Hudson), Graham Dixon (New Hudson), Newey (Ariel), Fletcher (Douglas), Cocker (Singer), and Begg (Rudge), all found it advisable to push with their feet. Allan Hay (Quadrant), the sexagenarian humorist, lost his steering in the stones, charged the far bank with his engine roaring, popped neatly over the handle-bar, and got up laughing. Donaldson (New Hudson) dismounted further down and then came up well; Miss Hind's wrists were not powerful enough to curb her plunging Rex, when she got among the boulders, but she restarted on the clutch with a little help; North (Ariel) skidded heavily on his first attempt, but ran down a few yards, turned on the clutch, and shot up. Cuffe (Indian) made an admirable climb; the twin Hazlewood's engine was full of ginger, but the rider dangled his legs for fear of skids. Dixon (Singer) was baulked by cries of "Wide" when he had begun to cut in. Macdonald (Norton) fell heavily; Bell (New Hudson) stopped, Wood (Brough) stuck, Houghton (Bradbury), after a long wait down below, arrived minus his passenger. Oliphant (Premier) stopped but restarted on the clutch. The two G.W.K. cyclecars came round magnificently, Keiller, the faster, requiring a tremendous hand at the wheel to avoid the ditch; Wood slower but neater. Bischoff, who knew the hill, made a well nigh perfect climb, his Triumph's slow speed being eloquent of power, while Miss Langston weathered it in professional style. Le Vack (Motosacoche), who had stopped down below, stuck deep in the rut, while the telescope revealed Whitehouse (Rover) manfully pushing in the distance.

### A Clever Makeshift Repair.

P. E. Tolfree accomplished a very clever roadside repair. As he oiled up for Rest and be Thankful, the glass of his oil pump burst, so he fastened the pieces in position with court plaster, failing to obtain a new glass. In Oban he bought a thin glass lamp chimney, filed it to its proper length, padded it to correct thickness with wrappings of diachylon plaster, and cut a hole in the plaster for sight feed. White ran off the road at one corner, and buckled his wheel. He finished, but the tyre was badly worn on one side.

The remainder of the run would have been child's play but for the blind corners and rough going. A practical rider can guess its nature, if I say my  $3\frac{1}{2}$  h.p. did it all on a  $3\frac{3}{4}$  gear, but that I steered two-handed. There is ample accommodation of a comfortable nature in Oban, and we are

all looking forward to a continuance of sunshine to-morrow. To-day should effect a general improvement in the cornering, which is urgently needed. The fact is that English methods do not pay here, as a string of potholes just round a bend throws the front-wheel out wide in six inch bounces.

The alleged stiffest section of the route comes after lunch on Tuesday, with severe and twisty climbs at Devil's Elbow and Coedyridge.

### Marks Lost First Day.

The following list of marks lost were announced on Tuesday morning:

Mundy, Lord, Duncan, Bell, J. Bell, Miss Hind, 1 each.  
U. Downie, 3.  
Keiller (Rudge), 9.  
Douglas (Dot), 18.  
A. D. Scott, 60.  
W. F. Croyton card incomplete.

### Pitlochry, Tuesday afternoon.

"More circus riding" was the curt comment of one rider a few miles from the start this morning, and it was fortunate that the bright sunshine continued, for the roads were quite trying enough without the grease. The route ran along the shore of Loch Etive for a few miles, and then crossed the glorious pass of Brander, over to Dalmally once again. Bumps and corners cruelly blinded us to most of the scenery. One wag remarked that the road reminded him of an inebriated corkscrew spinning on a lathe. Near Dalmally the surface got worse.

A humorous side light on Scotch roads is provided by the following incident: An official car and several competitors rode for half a mile down a turning when the road suddenly petered out, and it proved that they were on the rough foundation of an unmade road, but it had felt just like the ordinary highway. Near Crianlarich the surface improved, and sometimes straight stretches nearly 100 yards in length were encountered. We saw no riders stopped, except one or two men whose tyres were gashed through by sharp stones, and all the early starters had made good time up to the first check at Killin.

When we passed through Killin and on to the luncheon stop at Pitlochry the road was familiar to many, but its surface is not so good as in 1911, and wherever the surface was really good, for a mile or two, the police were obtrusively busy. There was no hill-climbing this morning, and our one excitement has consisted in trying to acquire a permanent squint so as to watch the gorgeous scenery with one eye and the road surface with the other.

## FRENCH INTERNATIONAL CUP RACE.

Organised by the A.C. de Sarthe and the French paper *L'Auto*, an important race entitled La Coupe Internationale des Motocyclistes will be held on September 8th. The course will be guarded by military, as in the important car races, and will be a circuit of twenty-five kilometres to be covered either eight or ten times—248 or 310 miles.

## CLUB COMPETITION RESULTS.

The results of the Hampshire Motor Cycle Union hill-climb, held on Wednesday last week, at Hayden Wood Hill, East Meon, are as follow. The hill is threequarters of a mile long, and there are no bends. There were nearly fifty entries, and just over 130 sat down to tea at the George Hotel:

Class I.—F. J. Burt ( $2\frac{3}{4}$  New Hudson); 2, Percy Kirk ( $2\frac{3}{4}$  Enfield); 3, F. Evers ( $2\frac{3}{4}$  Hobart).

Class II.—1, R. C. Pearson ( $3\frac{1}{2}$  Premier); 2, F. J. Burt ( $2\frac{3}{4}$  New Hudson); 3, Percy Kirk ( $2\frac{3}{4}$  Enfield).

Class IV.—1, Frank Tappenden ( $3\frac{1}{2}$  Premier); 2, R. C. Pearson ( $3\frac{1}{2}$  Premier); 3, Rafe Barclay (T.T. Rudge).

Class V., Sidecars.—1, Frank Tappenden ( $3\frac{1}{2}$  Premier); 2, P. Kiln ( $3\frac{1}{2}$  Hudson); 3, R. C. Pearson ( $3\frac{1}{2}$  Premier).

J. G. Kimber (6 Matchless) made the fastest time of the day, and is the winner of a special gold medal. A Wood-Milne tyre was given for the fastest time in Class II., which was won by R. C. Pearson ( $3\frac{1}{2}$  Premier).

### A Consumption Test.

A petrol consumption test, held by the Haverstock M.C.C. on the 21st inst., resulted as follow: 1, W. Brown ( $3\frac{1}{2}$  Zenith sc.); 2, F. Richards ( $3\frac{1}{2}$  Centaur sc.); 3, H. Moliver (Rudge Multi sc.); 4, A. Lunnion ( $3\frac{1}{2}$  Zenith sc.). The winner's consumption worked out at 135 m.p.g.

Front view of the Wall cyclecar, showing dummy radiator swung back, rendering the engine accessible (see page 841).

## RIMS AND TYRES.

### Rim Width, Resilience, and Side-slip.

THE suggestion made in *The Motor Cycle* some months ago that tyre manufacturers should send out metal templates for testing rims is an excellent one, and it is to be hoped that it will be acted on. Everything appertaining to tyres and rims is of such prime importance, not only to the user but to the entire trade, that the Manufacturers' Union might well keep the subject always before its members—at least until something has been done to reduce the present amount of loss, annoyance, and, at times, danger due to lack of standardisation in tyre and rim sizes and certain other matters. If the manufacturer could be induced to regard the tyres as equal in importance to the engine, users would soon observe an improvement in them, with a proportionate reduction of expense and enforced stoppages.

### Countersunk Rims.

There is a point in connection with rims whereon we might with advantage copy the Americans. This is in countersinking the rim to receive the nipple head and washer. The only objection I have ever heard raised to this practice is that the smooth surface of the hub side of the rim would be spoilt, but this is quite negligible. It is surely better to have the "hob nails" on the exterior of the rim than to have a similar or rather rougher pattern inside. The accompanying sketch shows a section of an American motor cycle rim with punched spoke hole and recess for the rivet head, as sent out by the makers. English rim makers send out the bulk of their rims drilled and plated or enamelled, and if they could be induced to countersink them also there would be no extra trouble involved in wheel building—in fact, a rim with the spoke holes punched at the correct distances and properly "staggered" saves the wheel builder considerable time and results in a better wheel.

### Damage to Tubes.

Nipples, washers, and spoke ends (which latter are not always filed flush as they should be) are responsible for much tyre trouble; they give a wavy seating for the beads of a tyre, and if these are of the kind intended to meet in the rim bed instead of overlapping, the nipples will often cause a series of gaps through which the inner tube blows into blisters and either nips or bursts. Moreover, even when completely covered by a flap or a tape the nipples seem in many cases to have the unpleasant knack of reproducing themselves on the tube in the shape of small blisters—"babies' heads" as they are called by repairers—and if these do not burst, the unequal strain frequently causes the tube to perish and crack at these places, causing an otherwise sound tube to be scrapped. With wired-on covers the washers and nipple heads make the work of attaching and detaching far more difficult; let anyone who doubts this try putting a wired-edge cover on a rim before it is built up and without a tape in the bed, and afterwards try it when the wheel is built up and a tape fitted over the nipple heads. Were the rims countersunk, after the wheel was built the depression could be filled up with some substance that would set hard—shellac, for instance—and the result would be a perfectly smooth interior surface which if desired could be covered with a very thin adhesive tape. This

### The Neglected Wired-on Cover.

would make easier the work of attaching and detaching beaded-edge tyres, while it would practically remove all objections to the wired-on tyre, which at present is rather troublesome to those who have not acquired the very simple knack of manipulating it.

### Rim Widths and Tyre Sizes.

Just now, when many firms are selling  $2\frac{1}{2}$  in. tyres to fit existing  $2\frac{1}{4}$  in. rims, and 3 in. tyres for  $2\frac{1}{2}$  in. rims, it may be well to mention that such tyres need to be kept well inflated on a solo mount, otherwise there is a tendency to roll at corners, and also a greater disposition to sideslip. Rim width has a very great influence, both on resilience and skidding—the narrower the rim in proportion to the tyre upon it, the livelier or more resilient will be the tyre, and correspondingly increased will be the tendency to roll or skid. If the width of a beaded edge rim be reduced beyond a certain amount, the tyre would pull off at corners, and, of course, the greater the speed and load the more readily would this happen. *Apropos* of this, it may be mentioned that the special Kempshall tyre fitted for sidecar work on the P. and M. machines has a specially wide rim.

### The Wired-on Cover.

This is the "Cinderella" of the motor cycle tyre world, but it is gradually gaining ground. Personally, I favour the wired-on cover because it is cheapest, both in first cost and in use; it cannot cut or burst at the beads, and no retreader can alter the size and fit on the rim unless he wraps something round the

wires. Again, the shape of a wired-on rim seems to prevent it getting kinked as much as beaded edge rims—some of the latter having very wide spreading flat beads—and, further, a kinked rim does not mean a cut cover or affect the security of the cover upon the rim. The tendency to creep when deflated is one of the objections raised to the wired tyre, but it will not creep if pumped to a pressure of 15 or 20 lbs. to the square inch, which is too low for riding any motor cycle tyre.

Owing to the difficulty of obtaining studded wired-on covers, many riders with a preference for this tread have put their inclinations aside and used beaded covers. Many manufacturers still decline to make wired covers with really efficient non-skidding treads, but it is now possible to obtain rubber studded wired covers in various sizes and weights from Messrs. W. and A. Bates, the Leicester Rubber Co., and other firms. The Michelin Tyre Co. make a steel studded wired cover in 26 in. x 2 in. and larger sizes, and the Rom Tyre Co. have a heavy tyre with combined rubber bars and steel studs, which is stout enough for sidecar work.

Experience induces the opinion that a  $2\frac{1}{4}$  in. wired tyre will stand sidecar work better than a beaded tyre of the same size, though a larger size is at all times preferable for a passenger combination. PRECENTAUR.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

July 25th	...	8.58 p.m.
" 27th	...	8.55 "
" 29th	...	8.52 "
" 31st	...	8.49 "

## Cyclecars.

At the end of next month two new cyclecars, the product of large Midland firms, are expected to be made public.

## Detachable Wheels for Sidecars.

The latest fitment on sidecars is a detachable and interchangeable wheel. The 1913 model Clyno has this feature, the makers having purchased the patent from J. M. Lamb, whose quick acting device was illustrated in *The Motor Cycle* of February 15th, page 180.

## Rear Lights on Vehicles

The byelaw made by the Kent County Council on May 15th, making it compulsory for all vehicles to show a red rear light at night, will come into force on August 1st next. The following counties now have byelaws rendering rear lights compulsory on all vehicles: Warwickshire, Hampshire, Buckingham, and Kent. It is sincerely to be hoped that all counties in the kingdom will follow suit, as the number of fatal accidents due to unlighted vehicles on country roads, is on the increase. It is little short of criminal neglect to fail to carry these necessary warnings, which, in the case of reflectors, are so cheaply obtained, and entail no cost or worry to maintain in a state of efficiency.

W. T. Wartnaby (3½ h.p. W. & D.), a successful competitor in the Coventry and Warwickshire M.C. Manville Trophy Trial. He climbed all hills on a single gear.

## Speed Trials in the North.

The Cumberland M.C.C. has received permission to hold open speed trials on August 5th. This club asked the A.C.U. to appoint a judge, and Mr. T. W. Loughborough will act in that capacity.

## Kick Starters.

There is no doubt that engine foot-starting devices will be more in evidence on 1913 models than ever before. Already we have seen three experimental models for 1913 with such a fitment under test.

## Bad Surface on Honister.

On Sunday, July 14th, a party of the Westmorland M.C.C. had a run to Honister. Two members attempted the climb from Buttermere, E. Jefferys (7 h.p. Indian) and B. Jefferys (5-6 h.p.

## AUGUST BANK HOLIDAY.

Owing to the above Holiday, the issue of "The Motor Cycle" for August 8th will be closed for press earlier than usual. All copy and instructions for paragraph advertisements in this issue must therefore be in our hands not later than first post on Thursday, August 1st.

Bat-Jap). The surface of the road was atrocious, the left-hand side being impossible to ride on, owing to the skids on coach wheels having torn it up about a foot deep. B. Jefferys's first attempt nearly landed him into the stream. His second attempt was successful, and, as an exhibition of nerve and skilful driving, would be hard to beat. The gear used on the Bat was a 4½ to 1. The foreman of the slate quarries at the top of the pass said that it would be impossible for any motor bicycle to climb it, as the road was so much worse than when Collier and Smith climbed the pass.

## Open Exhausts.

Fines are being imposed in America on motor cyclists who ride about with open exhausts. Arrests have been fairly numerous of late, and five motor cyclists were recently fined \$3 each. The judge made it clear, however, that unless the nuisance be stopped soon a penalty of a more serious nature will be imposed.

## Motor Bicycles with Silent Knight Engines.

We are given to understand that Mr. J. S. Gibson, manager of the Mechanical Department of the Canada Motor and Cycle Co., West Toronto, will shortly bring out a motor cycle fitted with a Knight engine. There have been several rumours in this country of motor cycles fitted with this engine, but up to the present time we have not heard of one behaving satisfactorily on the road.

## SPECIAL FEATURES.

### THE SCOTTISH TRIALS (Illustrated.)

### TWO NEW CYCLECARS.

### WEEK-END COMPETITIONS IN ALL PARTS

Described and Illustrated.

## A Comprehensive Issue.

This issue contains illustrated reports—in most cases exclusive—of important club competitions held in all parts of the country. *The Motor Cycle* is the only journal which regularly covers every important motor cycle event, no matter whether in the north, south, east, or west.

The first two days of the Scottish trials are also described, and illustrations of the new models in that important event included.

## Mont Ventoux Climbed in 29 Minutes.

A touring test, including the ascent of Mont Ventoux, was held by the Marseilles M.C. on the 14th with the following result: Class I. (300 c.c.), riders of Terrot machines were 1, 2, and 3. Class II. (400 c.c.), Motosacoches 1 and 2. Class III. (500 c.c.), 1 Moto-Rève, 2 Peugeot. Berlie (Moto-Rève) gained most points, winning a silver shield. The fastest ascent in the hill-test was made by the rider of a René-Gillet in 29m.

Showing the outward appearance of the new handlebar-controlled Longuemare automatic motor cycle carburettor.

**A Good Sidecar Load.**

The accompanying photograph depicts a standard single-gear clutch model Triumph with a load of ten passengers and driver (about 116 stones in all). With this load the driver, Mr. A.

A. Spurgeon with his Triumph sidecar combination and ten passengers.

Spurgeon, of Coventry, claims to have ascended a hill near that city a quarter of a mile in length, the gradient of which is 1 in 23. The machine, which had previously covered 6,000 miles, was geared 6 to 1, and, we are told, was started from a standstill by means of the clutch, accomplishing the test without a hitch.

**The Junior T.T. Winner Better.**

W. Harry Bashall, who has lately had a week in bed with a poisoned throat, is out and about again, we are glad to say.

**Motorists' Insurance.**

A certain town clerk is credited with the rather absurd statement that motorists being insured did not have to pay their own fines, consequently it was of little use imposing a penalty of that sort upon them. He suggested imprisonment as an alternative.

**Record Breaking in Canada.**

The first annual championships of the recently organised Canadian Motor Cyclists' Association were held at Hamilton, Ontario, on Dominion Day, the 1st inst., when 4,500 persons saw all existing Canadian records badly smashed. Although many good racing men from the United States took part in the meet, including the renowned Don Klark, an Indian rider of Detroit, the new Dominion champion turned up in Joe Baribeau, a real Canadian of Winnipeg, who also rides an Indian machine. Baribeau took three out of the four trade rider events. His greatest triumph was in the twenty-five mile race, which he won in 27m. 10s., or three minutes better than the distance has ever been covered before in that country. Klark won an invitation ten mile race in 8m. 55s., which was also a record. A British machine took first place in the only event on the programme in which overseas machines were entered, N. Newport, of Toronto, on a Triumph, walking away with the prize in the five mile belt drive race. Several American makes were beaten in this contest.

**Open Speed Trials.**

There is a big entry for the speed trials of the Oxford M.C.C., to be held in Heythrop Park, near Chipping Norton, on Saturday next.

**Police Traps.**

A trap is being worked between St. Albans and Redbourne, and it is said the trappers are secreted in cottages which border the road. Motor cyclists are warned to be very careful on this section of the London-Birmingham Road.

Care should also be exercised in Long Preston (Yorks).

**Motor Cycle for Sewerage Inspector.**

At the last meeting of the West Kent Sewerage Board, held at Bromley, the Subcommittee reported that an order had been placed with Humber, Ltd., for a 3½ h.p. two-speed Humber with extra strong tyres; also a sidecar to carry a workman and the necessary tools. The machine is for the use of the assistant engineer of the West Kent Division.

**Rear Lights in Kent.**

On August 1st a new byelaw comes into force in Kent compelling all vehicles to carry a rear red light "visible at a reasonable distance." Reflectors will be allowed. The byelaw excludes cycles, traction engines, or vehicles drawn by hand.

**Important Rudge Developments.**

We are authorised to state that the management of Rudge-Whitworth, Ltd., have decided to manufacture two new models for 1913. One is a four-wheeled cyclecar, in which will be embodied several new features, and the other is a sidecar, which will be specially designed to suit the Rudge-multi. Details of the new patterns will be made public in the late autumn of this year.

**First Propeller-driven Vehicle.**

The daily press last week described a French motor car fitted with an aeroplane propeller as a novelty. The first vehicle to be driven in this manner was constructed some years ago by Anzani. It was a motor cycle with the propeller in front, and was used by Professor Archdeacon for determining the angles of aeroplane propeller blades; it attained a speed of fifty miles an hour on the road.

**Phenomenal Petrol Consumption.**

The performance of H. S. Askew in the consumption trial, held on May 11th by the Oxford M.C.C., and duly reported in *The Motor Cycle*, was so remarkable that few would credit it. We suggested that Mr. Askew repeat the performance under similar conditions, which he attempted to do. The total weight was 5 cwt. 2 qrs. 14 lbs., and the petrol allowance 31 ozs. 6 drs., the same as before. The distance covered was 26.4 miles, which gives 135.6 miles per gallon. This is a very fine performance, and deservedly gains first prize in the passenger class.

FUTURE EVENTS

THE WELSH OPEN HILL-CLIMB AT CAERPHILLY.

J. C. Moore (Rudge) negotiating the abrupt bend in the Cardiff M.C. hill-climb.

# B.M.C.R.C. FIFTH MONTHLY MEETING.

**T**HE fifth monthly meeting of the British Motor Cycle Racing Club must be in every way written down a thorough success. As the following results show, some excellent performances were put up, including new figures for the flying mile in two classes. The programme opened with the Third 1912 Time Trials, over a measured kilometre and a measured mile, flying starts. The good figures made are perhaps in a degree due to the absence of wind. Results:

## CLASS A.—275 C.C.

			Kilometre.		Mile.
		secs.	m.p.h.	secs.	m.p.h.
H. Martin (1 Martin)	76	×59.5	35.2 = 63.5	57.4	= 62.72

## CLASS B.—350 C.C.

H. Martin (1 Martin)	85.5	×59.5	32.9 = 67.9	*53.06 = 67.85
S. Bailey (2 Douglas)	61	×60	35 = 63.91	56.4 = 63.83
W. Hodgkinson (1 Caeco)	85	×60	45 = 49.7	74.8 = 48.13
S. Axford (1 Martin)	70	×90	48 = 46.6	75.0 = 48
W. Hodgkinson (1 Caeco)	85	×60	47.6 = 46.9	76.6 = 47

\*New figures for the flying mile Class B, the previous best being also Martin's, 65.97 m.p.h., made August, 1910. Martin's kilometre record, made at the same time, still stands at 68.28 m.p.h.

## CLASS C.—500 C.C.

P. Brewster (1 Norton)	79	×100	30.25 = 73.95	*48.93 = 73.57
G. Stanley (1 Singer)	85	×88	31.8 = 70.34	51.0 = 70.59
S. D. Timson (1 Rudge)	85	×88	35.2 = 63.35	56.8 = 63.38
S. Axford (2 Martin)	76	×58	35 = 63.9	57.4 = 62.72

\*New record, just beating G. E. Stanley's previous Singer figures of 73.2 m.p.h. Singularly enough, Stanley's figures for the kilometre, viz., 75.43 m.p.h., made at the same time, May, 1912, still stand as record.

## CLASS D.—750 C.C.

R. Printz (2 Bat-Jap)	85.5	×65	35.8 = 62.48	56.2 = 54
-----------------------	------	-----	--------------	-----------

## CLASS E.—1,000 C.C.

E. Baragwanath (2 Winit)	90	×77.5	30.4 = 73.58	49 = 73.47
--------------------------	----	-------	--------------	------------

## CLASS E.—1,000 C.C. WITH SIDECAR.

G. Hunter (2 Zenith)	90	×77.5	35.6 = 62.84	56.6 = 63.6
----------------------	----	-------	--------------	-------------

## Junior Scratch Race.

The Junior Five Lap Scratch Race for machines up to 350 c.c. brought out six starters. The distance was 13 miles 1,035 yards.

Bailey (Douglas) got away in wonderful style, and had already established a lead of twenty or thirty yards at the entrance of the railway straight. This was evidently too

The start of the five lap Scratch Race. S. L. Bailey (Douglas), put up a good race, but was eventually beaten by Stanley (Singer).

much for Harry Martin, who set out at once to pick up the Douglas, which he did behind the aeroplane sheds in very fine style. The first lap finished in the following order: Martin (Martin-Jap); Bailey (Douglas), 3 yards; Stanley (Singer), 100 yards; and Woodman (Humber), 100 yards.

On completing a lap, Slatter (Alecyon) turned in apparently with valve trouble. The same order was maintained for the second lap. On passing the fork Martin's long exhaust pipe came loose, and this rider pulled up, letting Bailey into first place.

On the third lap Bailey led Stanley by about 150 yards, Woodman being about a mile behind the latter. It was quite obvious, however, that the Douglas was being steadily overhauled by the Singer, and no one was therefore surprised to see only 50 yards separating Bailey and Stanley on the completion of the fourth lap.

The Singer showed no signs of slackening, and, thanks largely to Stanley's splendid riding, caught the humming Douglas on the Byfleet banking, and obtained a narrow win by only three-fifths of a second, or about 15 yards. Stanley's time from a standing start was 13m. 49½s., or at the rate of 59.4 m.p.h. Result:

1. G. E. Stanley (1 Singer)	...	...	69×80	299 c.c.
2. S. L. Bailey (2 Douglas)	...	...	61×60	350 c.c.
3. A. E. Woodman (2 Humber)	...	...	60×60	340 c.c.

## Senior Five-lap Scratch Race.

This event was for any type not exceeding 500 c.c. Distance, 13 miles 1,035 yards. Six starters.

After his splendid riding in the time trials, Brewster (Norton) naturally started a warm favourite. The first lap was completed with Stanley (Singer) leading by about 10 yards from Brewster, and Timson about 100 yards behind, Garrett and Mills (Regal-Precisions) and Axford (Martin-Jap) forming a bunch in the rear. Another circuit brought Stanley forward considerably, so that he was now leading by a couple of hundred yards. The third lap only served to make the differences more distinct, as the next man behind Stanley was a good half-mile away. Brewster's magneto was now giving him trouble, and he therefore yielded second place to Garrett, who was being closely followed by Axford, Timson, and Mills in this order.

Except for the fact that Axford had to retire through sooted plugs in the next round, no change took place except the lengthening of the gaps between the riders. Stanley was never challenged, and steadily increased his lead, finally crossing the finishing line fully a mile in front of Garrett, while Timson was third, and Mills fourth. Result:

1. G. E. Stanley (1 Singer)	...	...	85×88	499 c.c.
2. S. F. Garrett (1 Regal-Precision)	...	...	85×88	499 c.c.
3. S. D. Timson (1 Rudge)	...	...	85×88	499 c.c.
4. H. C. Mills (1 Regal-Precision)	...	...	85×88	499 c.c.

S. L. Bailey (Douglas).

P. Brewster (Norton), who set up a new mile record.

**B.M.C.R.C. Fifth Monthly Meeting —****All Comers' Handicap.**

This was for motor cycles with or without sidecars up to 1,000 c.c., and for cyclecars up to 1,100 c.c. Eleven starters. The Carter cyclecar made its debut in this event, and was the centre of a curious crowd. It is a three-wheeler with a steel frame attached to the front axle by a transverse laminated spring arranged like the Sizaire-Naudin. Two straight leaf springs are used in the rear, the radius rods being pressed steel members of U section. The engine is an enormous air-cooled twin— $101\frac{1}{2} \times 130$  mm. = 2,102 c.c.—with cylinders arranged at  $90^\circ$ . For the purposes of the race, however, one of the cylinders had been removed, and the hole in the crank chamber covered with a cap. The inlet valve, situated immediately over the exhaust, is automatically operated. Between the cylinders is arranged a four-bladed centrifugal fan of large diameter, driven by a friction roller from the edge of a very large flywheel, which enabled the engine, even as a single-cylinder, to run quite slowly and steadily. Transmission is direct from the crankshaft to the back wheel by means of a leather V belt running over an expandable pulley, this providing the only clutch and change speed gear. Steering is by rack and pinion. A quite smart torpedo body is used with a petrol tank in the extreme "nose" thereof.

Bailey (Douglas) from the very first assumed a lead that he managed with little difficulty to hold all the way through, thanks principally to the fact that Baragwanath (Winit-Jap), who was on scratch, dropped out at the end of the second lap for some unexplained reason. He and his large engined machine (998 c.c.) were travelling at a terrific speed, and there was every indication that he would certainly overhaul the whole field quite easily up till the time that he disappeared.

The progress of the race will be apparent from the following table, which represents the positions of the riders at the end of each lap.

Lap 1.—Bailey (Douglas), Woodman (Humber), Hunter (Zenith sc.), Carter (Carter cyclecar), Garrett (Regal-Precision), Holzapfel (Holzapfel-Jap), Mills (Regal-Precision),

Printz (Bat), Baragwanath (Winit-Jap). Brewster (Norton) retired through magneto trouble.

Lap 2.—Bailey, Garrett, Woodman, Mills, Holzapfel, Baragwanath, Printz, Carter. Hunter retired at the end of this lap.

Lap 3.—Bailey, Garrett, Mills, Printz, Holzapfel, Woodman. Timson retired.

Lap 4.—Bailey, Garrett, Printz, Mills (missing fire and dropping behind), Woodman.

Result :

	mm.	c.c.	m. s.
1. S. L. Bailey (2 Douglas) ... ..	61×60	350	2 5
2. S. F. Garrett (1 Regal-Precision) ... ..	85×88	499	1 20
3. H. G. Mills (1 Regal Precision) ... ..	85×88	499	1 20

**Test Hill-climb.**

The afternoon's sport concluded with the Brooklands Test Hill-climb, for which eight entries had been received, though only three riders actually made ascents. Competitors were started on the level about 50 yards from the foot of the hill.

CLASS B.—350 c.c.

S. L. Bailey (Douglas) ... .. 33.36 m.p.h.

CLASS C.—500 c.c.

S. D. Timson (Rudge) ... .. 28.59 m.p.h.

CLASS E.—1,000 c.c.

G. F. Hunter (Zenith-Gradua) ... .. 32.46 m.p.h.

Bailey's ascent was marvellous, and its finish amongst the most sensational that has been seen at Brooklands. At the summit of the hill the ground becomes suddenly flat, and Bailey came up at such a speed that his machine completely left the ground a dozen feet before returning to terra-firma again, which it did with its rider quite unconcerned.

South's machine was geared very low indeed, but its speed was sufficient to give a very well pronounced Ballig Bridge leap.

Hunter was evidently no novice at test hill work, or, at any rate, he had no wish to go flying, for he cut out practically as soon as he reached the 1 in 4 portion. Considering this, his speed was excellent.

## Irish End-to-end Reliability Run.—Results.

The committee of the Motor Cycle Union of Ireland, Ulster Centre, having verified the timekeepers' checking sheets at the various controls, it has been found that nineteen riders qualified for gold medals with a maximum of 120 marks, and nine riders qualified for silver. F. Ruddell (Bradbury) and F. C. North (Ariel) finished 22 mins. and 20 mins. respectively before schedule, thus

exceeding the 10 mins. margin allowed, and being in consequence disqualified. Whilst sympathising with Rex Mundy, who thought the finish was situate beyond Ballycastle, and lost three marks by being early, and with Hugh Gibson, who gave away his stock of petrol to another competitor, and left himself with an empty tank, losing as a consequence five marks for being late, the committee regretted their inability to depart from the placings arrived at in accordance with the conditions.

To ascertain the winner of the Palmer Trophy, it was necessary to utilise the times at the secret check, and the placings are: 1, C. E. Murphy, Cootehill ( $3\frac{1}{2}$  h.p. Triumph), total variation from schedule 35s.; 2, J. Stewart, Belfast ( $3\frac{1}{2}$  h.p. Triumph), 1m.; 3, J. Lavery, Belfast ( $3\frac{1}{2}$  h.p. Ariel), 1m. 45s.

The following riders were successful, in addition to those mentioned in last week's unconfirmed list (page 321): Gold medal, W. Kirk (5 h.p. Indian); silver medals, R. Mundy ( $2\frac{3}{4}$  h.p. Douglas), H. Gibson ( $3\frac{1}{2}$  h.p. Bradbury), H. P. Mooney, and D. Gray ( $3\frac{1}{2}$  h.p. James).

Special prize for best lightweight performance.—E. Clark ( $2\frac{3}{4}$  h.p. Douglas).

Special prize for best sidecar performance.—H. Gibson ( $3\frac{1}{2}$  h.p. Bradbury).

Special medal, presented by Dublin District Club.—C. E. Murphy ( $3\frac{1}{2}$  Triumph).

**BIRMINGHAM M.C.C. SANGSTER TROPHY TRIAL.**

The Sangster Trophy trial results are as follows: A. D. Arter ( $3\frac{1}{2}$  James and sidecar) and W. H. Egginton ( $3\frac{1}{2}$  New Hudson and sidecar) lost no marks, bracketed first. Each is awarded a gold medal, and will hold the trophy for six months. T. Pollock ( $3\frac{1}{2}$  James) last 30 secs.; and S. Smith ( $3\frac{1}{2}$  Norton) lost 1 minute.

On Saturday next, 27th inst., a club reunion will be held at Stratford-on-Avon. Members will start from King's Heath tram terminus, and ride to Stratford *via* Alcester.

Streatham and District and Woolwich, Plumstead, and District M.C.C.'s Inter-team Trial. The competitors' machines paraded by the road side during the luncheon stop. Capt. Nicholl, the judge, is seen in the foreground.

# Sutton Coldfield A.C. Members' Hill-climb.

H. C. Newman (Ivy-Precision) with W. Creyton as passenger in an extraordinary position.

Hints Hill, near Tamworth, was this year's venue of the Sutton Coldfield annual climb. Coalport Hill being at present in a quite impossible condition, the search for a suitable test ended in the choice of a hill without the usual bend, but with a stiff gradient. The well tuned up machines of the "crack" riders, of course, made some very fast times, and it was pleasant to go through an afternoon's good sport without the slightest mishap to mar the enjoyment. In Class II. H. C. Newman (34 $\frac{1}{2}$ s.) (3 $\frac{1}{2}$  Ivy Precision) really made fastest time, but was disqualified owing to his machine not quite conforming to regulations—though of the standard "Ivy" model. Class VI. was won by F. Shakespeare (8 Rex-Jap) in the fastest time of the day. He also made fastest time in the sidecar class. This rider had never before ridden in a motor cycle competition.

Results (subject to confirmation):

## CLASS I.—LIGHTWEIGHTS.

	Time.	Formula.
P. W. Owen (37 $\frac{3}{8}$ s.) (2 $\frac{1}{2}$ Zenith) ...	1	1
F. S. Whitworth (2 $\frac{3}{4}$ Douglas) ...	2	3
V. Busby (2 $\frac{3}{4}$ Humber) ...	3	2

W. Creyton (2 $\frac{1}{2}$  h.p. Humber) crossing the finishing line.

## CLASS II.—SINGLES UNDER 520 C.C.

J. Woodhouse (3 $\frac{1}{2}$ Regal-Precision) ...	1	1
H. G. Dixon (3 $\frac{1}{2}$ New Hudson) ...	2	4
L. A. Bees (3 $\frac{1}{2}$ L.M.C.) ...	3	2

## CLASS III.—MULTI-CYLINDERS UNDER 750 C.C.

F. S. Whitworth (37 $\frac{3}{8}$ s.) (4 Matchless) ...	1	1
J. St. John (6 F.N.) ...	2	2

## CLASS V.—T.T. UNDER 500 C.C.

K. Clark (34s.) (3 $\frac{1}{2}$ Corah) ...	1	2
H. C. Newman (3 $\frac{1}{2}$ Ivy-Precision) ...	2	5
J. Woodhouse (3 $\frac{1}{2}$ Regal-Precision) ...	3	1

## CLASS VI.—SINGLES OR TWINS OVER 520 C.C.

F. Shakespeare (34s.) (8 Rex-Jap) ...	1	2
H. Kenway (8 Matchless) ...	2	6
T. Pollock (3 $\frac{1}{2}$ James) ...	3	1

## CLASS VIII.—SINGLES AND SIDECARS.

H. C. Newman (45 $\frac{3}{8}$ s.) (Ivy-Precision) ...	1	1
T. Pollock (3 $\frac{1}{2}$ James) ...	2	3
J. Woodhouse (3 $\frac{1}{2}$ Regal-Precision) ...	5	2

## CLASS IX.—UNLIMITED AND SIDECARS.

F. Shakespeare (41 $\frac{3}{8}$ s.) (8 Rex-Jap) ...	1	3
H. C. Newman (3 $\frac{1}{2}$ Ivy-Precision) ...	2	1
T. Pollock (3 $\frac{1}{2}$ James) ...	3	2

R. H. Edwards (Triumph) nearing the summit. The photograph conveys a good idea of the nature of the hill.

## FRAMED ADDRESS TO MR. F. STRAIGHT.

The framed address which F. Dover and other readers suggested should be presented to F. Straight (late secretary of the A.C.U.) was forwarded to the recipient this week. The address reads as follows: "We, the undersigned, desire to express our appreciation of the valuable services rendered by you to the motor cycle pastime and industry during the ten years you acted as secretary to the Auto Cycle Union, and we request your acceptance of this address as a slight mark of our esteem."

## SPEED TRIALS AT PORTHCAWL.

Competitors for the All-comers' Handicap at Porthcawl lined up for the start. Observe the starting planks to prevent the wheels sinking into the wet sand.

Owing to the wetness of the sand and the protest of the competitors, a start could not be made in the motor cycle events until 6 p.m. on the 20th inst. Some very good times were made considering the heavy state of the track. The distance was one mile. Before the competition could be finished the sea came up again, and the last race was won in about 9in. of water. In the Sidecar Class two riders stuck in the soft sand. Newsome was the most successful rider, annexing two firsts. His speed was upwards of 50 m.p.h. Results:

CLASS I.—Machines with Cylinder Capacity not exceeding 350 c.c.

Rider and machine.	Time.
1. Kickham (2½ Douglas) ... ..	1m. 15½s.
2. Weatherilt (2½ Zenith) ... ..	1m. 20½s.
3. Britton (2½ Douglas) ... ..	1m. 27½s.

CLASS II.—Machines not exceeding 560 c.c.

1. Newsome (3½ Triumph) ... ..	1m. 11s.
2. Lewis (3½ Premier) ... ..	1m. 14½s.
3. Kickham (2½ Douglas) ... ..	1m. 15½s.

CLASS III.—For Machines with Cylinder Capacity not exceeding 1,000 c.c.

1. Newsome (3½ Triumph) ... ..	1m. 14s.
2. Barnes (8 Zenith) ... ..	1m. 17½s.
3. Kickham (2½ Douglas) ... ..	1m. 24½s.

CLASS VI.—Machines with Cylinder Capacity not exceeding 350 c.c.

1. J. J. Mathias (2½ Humber) ... ..	walked over.
-------------------------------------	--------------

CLASS VII.—Machines with Cylinder Capacity not exceeding 560 c.c.

1. R. M. Lewis (3½ Premier) ... ..	1m. 16½s.
2. J. C. Moore (3½ Rudge) ... ..	1m. 17½s.
3. J. J. Mathias (2½ Humber) ... ..	1m. 27½s.

CLASS IV.—Machines with Cylinder Capacity not exceeding 1,000 c.c. with Sidecar Attachment.

1. E. Chapman (5-6 Zenith) ... ..	2m. 37½s.
-----------------------------------	-----------

Barnes and Wade stuck in the sand.

CLASS VIII.—Machines with Cylinder Capacity not exceeding 1,000 c.c.

1. J. C. Moore (3½ Rudge) ... ..	1m. 17½s.
2. E. Chapman (5-6 Zenith) ... ..	1m. 30½s.

## CLUB NEWS.

## Mersey M.C.

An open hill-climb will be held at Pen-y-ball, Holywell, on August 3rd at 3 p.m. There will be classes for motor cycles and cyclecars. The hill is straight, the average gradient 1 in 7, and the steepest 1 in 4. The surface will be in good order. Entries must reach the hon. secretary, Mr. S. W. Carty, 5, Redcross Street, Liverpool, not later than the 30th inst.

## Dublin and District M.C.C.

An open reliability trial will be held on August 5th and 5th. Routes: First day—Dublin, Fermoy, Mallow, Killarney, Kenmare, Glengariffe (229 miles). Second day—Glengariffe, Inchgeela, Cork, Cashel, Dublin (214 miles). Competitors must assemble each day at 5.30 a.m. An average speed of 20 m.p.h. must be observed. There will be several valuable prizes. Entries close on the 31st inst. Application should be made to Mr. F. J. Walker, hon. secretary, 9, Grafton Street, Dublin.

## The Motor Cycling Club.

A standard reliability hill-climbing and brake testing trial will be held on August 3rd and 5th. The route will be Hungerford, Marlborough, Trowbridge, Wells, Bridgwater, Porlock, Lynmouth, Lynton, Parracombe, and Barnstaple. Competitors will be expected to make clean ascents of both Porlock and Countisbury Hills, and stop not more than three times on the test descent.

Lincolnshire M.C.C. Speed Trials. L. W. Forington (Indian) passing the finishing post. He made fastest time and gained second place on formula.

## Club News.—

Streatham and District, and Woolwich, Plumstead and District M.C.C.'s inter-team trial. H. A. Collier is seen in a new role, starting the competitors.

## Evesham M.C.

On the 17th inst. a petrol consumption trial was held over a route of thirteen miles. The results were obtained by the A.C.U. formula, and the figures given are simply figures of merit:

1. F. Sharpe (3½ B.S.A.)	...	...	43.72
2. E. Holloway (3½ Triumph)	...	...	41.13
3. A. White (3½ Triumph)	...	...	38.36

## Stratford-on-Avon and District M.C.C.

Result of the hill-climb held at Ilmington Hill on the 13th inst:

Touring Singles.—1, H. W. Wynn (Rudge), 24½s.; 2, W. Ball (Rudge), 27½s.; 3, F. Drew (Rudge), 31s.

T.T. Singles.—1, F. Guyver (Triumph), 22½s.; 2, Heiss (Rudge), 24½s.; 3, R. Holyoake (Triumph), 26½s.

Open.—1, H. W. Wynn (Rudge), 24s.; 2, Heiss (Rudge), 24½s.; 3, F. Drew (Rudge), 24½s.

## Westmorland M.C.C.

Speed trials were held last week in Lowther Park, Penrith, by kind permission of the Earl of Lonsdale. Results:

Lightweight Class.—1, S. W. Phillpott (2½ Humber); 2, N. H. Brown (2½ Hazlewood); 3, R. M. Chaplow (2½ Humber).

Single-cylinder Class.—1, L. Pierce (3½ Corah); 2, W. B. Little (Rudge); 3, V. Harsmann (Singer).

Twin-cylinder Class.—1, L. S. Parker (Scott); 2, B. Jeffery (Bat); 3, J. W. Nelson (Scott).

Sidecar Class.—1, F. Rees (Rudge); 2, E. Burras (Zenith).

Old Crocks' Class.—1, J. Braithwaite (3½ Braithwaite).

## Torbay and District M.C.C.

A club hill-climb was held on the 20th inst. The following are the results on time:

## 500 C.C. OR OVER.

	m.	s.
1. R. Broadbear (3½ Premier) ...	0	56½
2. E. Hancock (3½ Premier) ...	1	2½
3. F. Edwards (8 Matchless) ...	1	3½

## UNDER 350 C.C.

1. A. Powell (2½ Enfield) ...	1	9½
2. W. P. Harding (2½ Douglas) ...	1	13½

## PASSENGER CLASS.

1. F. Edwards (8 Matchless sc.) ...	1	49½
2. — (6 Zenith sc.) ...	2	2½
3. — Williams (3½ Premier sc.) ...	2	53½

In the passenger class Edwards carried Mr. Davey, the heaviest member, who weighs about sixteen stones.

Miss Arden made a fast ascent.

R. Broadbear made a brilliant dash on his Premier and easily made fastest time of the day.

PII

## Doncaster and District M.C.C.

A flying kilometre handicap was held at Stapleton Park, near Pontefract, by the kind permission of Mr. J. Hope Barton, of Stapleton Park. The winner was the competitor who made the best increase on his previous time up to and including two and a half per cent. Results: 1, W. Wagstaffe (3½ h.p. Premier); 2, L. Baker (3½ h.p. Rex); 3, R. Eddell (5 h.p. Matchless). A special prize for the fastest time of the day was won by J. H. Wilkinson (5 h.p. T.T. Matchless), his time being 32½s.

## Essex M.C.

A joint gymkhana was held at King's Oak, High Beech, Essex, on the 20th inst., in conjunction with the Walthamstow M.C. Results:

Potato picking.—F. A. Applebee (3½ T.T. Scott).  
Tilting at the rings, lemon cutting, and Turk's head cutting.—F. W. Applebee (2½ Centaur).  
Musical chairs.—C. Pearson (2½ Douglas).  
Belt changing.—C. Pearson (2½ Douglas).  
Target pegging.—J. A. Campbell (3½ Rudge and sc.).  
Apple hobbing.—G. F. Gray (3½ Rudge).

## Inter-club Team Trial.

The following clubs sent teams to compete in the inter-club reliability trial held on a fifty-eight mile course in West Kent: Woolwich and District, Purley and District, Streatham and District, Putney and District, Brookdale and South-East London. The result was a win for the Brookdale Club, seven riders out of nine negotiating the whole course within schedule time. F. Cox (A.C.), J. Holt (3½ Pratt), E. M. Oliver (3½ Triumph), H. A. Cooper (3½ Bradbury), R. Croucher (3½ Kerry-Abingdon), C. Cakebread (3½ Triumph), J. Southgate (3½ Matchless), W. Guiver (3½ Rudge), and F. Bowes (3½ B.S.A.) represented the club.

## Sheffield and Hallamshire M.C.C.

A flexibility hill-climb was held at Stanington on Saturday last. Results:

	Diff. between fast and slow climbs.
1. J. Haslam (6 Zenith) ...	3m. 45s.
2. F. Donovan (6 Zenith) ...	3m. 44½s.
3. S. Sawyer (3½ Premier) ...	3m. 12s.
4. J. Carter (2½ A.J.S.) ...	2m. 5½s.

The official results of the Sheffield-Holyhead-Sheffield reliability trial are:

	Lost marks.
1. { D. Bradbury (3½ Norton) ...	0
1. { J. Haslam (6 Zenith) ...	0
1. { T. Durant (3½ Norton) ...	0
4. F. Dover (3½ Premier) ...	1
5. R. Garnett (6 Matchless) ...	2

North Middlesex M.C.C. Open Trial. A general view of the start at the Old Gatehouse, Highgate.

## Club News.—

**Cumberland County M.C.C.**

The reliability trial to Harrogate will take place on the 28th inst. instead of August 4th as previously arranged.

**Northamptonshire M.C.C.**

The annual non-stop reliability trial was held on the 13th inst. over a circular course in the vicinity of Cogenhoe. The prizewinners were: 1, C. T. Underwood (3½ h.p. Bradbury). Wren silver challenge trophy and gold medal; 2, A. J. Osborne (3½ h.p. Triumph); 3, R. P. Seal (3½ h.p. Triumph).

**Wolverhampton M.C.C.**

A reliability trial for the Corke Challenge Cup will be held on the 28th inst. The course will be by way of Bewdley, Ludlow, Knighton, Bishops Castle, Church Stretton (one and a half hour's stop for lunch), Dorrington, Shrewsbury, Ironbridge, Wellington, Market Drayton (stop for tea, one hour), Newport, to tram terminus, Tettenhall. Competitors will be timed at the rate of 20 m.p.h.

**Nottingham and District M.C.C.**

The results of the 100 miles reliability trial for the Dennis Bayley Challenge Cup were as follow: 1, Geo. Brough (Brough), time error, 10m. 59s., Challenge Cup and gold medal; 2, N. O. Soresby (Rudge), 30m. 3s., gold medal; 3, J. Richards, 36m. 7s., Wood-Milne tyre. Only seven finished out of twenty-two starters, the course being over the worst of the Derbyshire hills.

**Manchester M.C.**

An open twelve hours' reliability trial will be held on 3rd August. The course will be one of about 200 miles in length, but the actual route will not be announced until the morning of the trial. The maximum running time for the journey will be at the rate of eighteen miles per hour and the minimum twenty miles per hour. Drivers must proceed cautiously through towns and villages and show consideration to other users of the road, or they will render themselves liable to disqualification. Entries must be sent direct to the trials hon. secretary, Mr. C. E. Kettle, c/o Lookers, Ltd., Hardman Street, Deansgate, Manchester, not later than Saturday, 27th inst.

**Purley and District M.C.C.**

A novel contest was run off for passenger machines only on the 13th inst., over a course of about sixty miles, including six test hills—Marlpit Lane, Coulsdon; Wray Lane, Reigate; Pebblecombe Hill, Bletchworth; Coast Hill, Dorking; White Down Hill, Abinger; and Box Hill. The only clean non-stop run was made by L. F. Ebbutt (5-6 A.C. Sociable) who thus wins the captain's gold medal, a silver one presented by the secretary falling to C. Mason, and W. Leigh being third.

**Crossgates and District M.C.C.**

A reliability trial was run off on the 13th inst. The course was to Otley, Blubberhouses, Pateley Bridge, Ripon, Knaresborough, Wetherby, back to Whitkirk, the total distance being about eighty miles. The results were:

		Error fast or slow.
1.	H. Whitfield (3½ Triumph) ...	1m. 10s.
2.	J. Stuart White (2½ A.J.S.) ...	1m. 24s.
3.	H. and E. Haswell (3½ Bradbury sc.) ...	1m. 42s.
4.	F. Crosthwaite (6 Matchless sc.) ...	4m. 27s.
5.	T. Wilkinson (6 Matchless) ...	4m. 55s.
6.	J. Tattersall (3½ Bradbury sc.) ...	8m. 45s.

**Taunton and District M.C.C.**

The annual members' hill-climb was held on Buncombe Hill on Thursday, the 11th inst. The hill is 1,380 yards long, and has one bad corner, where the gradient is 1 in 5, otherwise the average is about 1 in 8. The timing was done by aid of the telephone, and was highly satisfactory. There were five classes, for which seventy-five entries were received. Results:

**CLASS I.—LIGHTWEIGHTS UP TO 360 C.C.**

	Rider and machine.	M. S.
1.	A. H. Knight (2½ Humber) ...	1 42½
2.	T. Marks (2½ Motosacoche) ...	2 9½
3.	R. C. Westlake (2½ Enfield) ...	2 18

**CLASS II.—MACHINES ABOVE 360 C.C.**

1.	W. E. Phillips (3½ Triumph) ...	1 19
2.	G. Wright (3½ Triumph) ...	1 24½
3.	T. H. Birdsall (3½ Premier) ...	1 28½

**CLASS III., SECTION I.—LIGHTWEIGHTS UP TO 360 C.C.**

1.	E. R. Norton (2½ Enfield) ...	1 50½
2.	H. F. Potter (2½ Enfield) ...	1 54½
3.	T. Hood (2½ Douglas) ...	2 22½

**CLASS III., SECTION II.—MACHINES OVER 360 C.C.**

1.	E. J. Hancock (3½ T.T. Premier) ...	1 16½
2.	W. E. Phillips (3½ Triumph) ...	1 20½
3.	W. F. Stone (7 Peugeot) ...	1 23½

**CLASS IV.—FLEXIBILITY (Fast and Slow Climbs on same Gear) Difference.**

1.	W. G. Potter (3½ P. and M.) ...	5 30½
2.	A. G. Bermingham (3½ P. and M.) ...	5 4½
3.	T. H. Birdsall (3½ Premier) ...	3 38½

**CLASS V.—SIDECARS.**

1.	W. E. Phillips (3½ Triumph) ...	1 49½
2.	W. H. Maunder (5 Clyno) ...	2 19
3.	F. Copplestone (5 Rex) ...	2 45

**Harrogate and District M.C.C.**

The annual reliability trial was held recently over a very difficult course of approximately 300 miles. The following well-known hills had to be climbed: Greenhow Hill, Kidstone Pass both sides, Kirkstone Pass from Ambleside, Yorkes Folly, and Norwood Edge. Thirteen started, but only seven completed the course. The competition was run for the £25 trophy which had been presented to the club by Messrs. Muratti. The result was as follows: T. C. Atkinson (3½ h.p. T.T. Triumph), W. Fawcett (2½ h.p. A.J.S. two-speed), and H. W. Fortune (3½ h.p. Brown two-speed), lost no marks and tied for first place; G. Hill (3½ h.p. Scott two speed), failed at Kidstone second day and late at checks, lost 26 marks; E. R. Davies (6 h.p. Matchless), continuous tyre troubles, lost over 100 marks; S. Clay (3½ h.p. Triumph), failed on Kirkstone and Kidstone Pass and late at checks lost 57 marks; J. E. Brooke (3½ h.p. Triumph three-speed) gear troubles, lost over 100 marks.

A group of members of the Haverstock M.C.C.

## QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Auxiliary Motor.

**?** I am trying to obtain information regarding auxiliary motors. Can you oblige me by answering the following questions: (1.) Can you recommend an auxiliary motor to fit on to a push cycle with fly nuts? If so, please state price (about), where obtainable, and power. (2.) Can you describe the method of transmission? (3.) Have you any knowledge of its speed and hill-climbing power?—G.H.

and 2.) We emphatically do not recommend an engine attached to a pedal bicycle. A pedal bicycle is not meant to be mechanically propelled, and would be most uncomfortable under these conditions. In preference to any attachment of the description mentioned, we should advise the purchase of one of the well-known lightweight motor cycles, of which there are several examples on the market.

### Engine Won't Run Slowly.

**?** (1.) I have a 2½ h.p. machine about five years old, and I cannot get it to run slowly. The slowest speed I am able to go without misfiring is about 18 m.p.h. I have tried stopping up some of the air holes of the B and B. carburetter (old pattern, converted to h.b.c.), but this has little effect other than heating the engine more rapidly. The extra air lever I keep shut off all the time. (2.) Would fitting a smaller jet have the same effect on the running of the engine as closing the throttle? (3.) The engine overheats very quickly in spite of the fact that I drive on as little throttle opening as possible and take in as much air as I can, but, as mentioned above, this latter is not possible to any extent unless I am going fast on account of misfiring.—A.B.

(1.) The engine mentioned is of small size with light flywheels, and it is always difficult to make these small engines run slowly. You should, however, be able to run slower than 18 m.p.h. Probably the latest B. and B. hand-controlled carburetter would improve matters. (2.) No; fitting a smaller jet would reduce consumption and power of the engine, but would not have the same effect as closing the throttle. It would, however, enable you to run more slowly. (3.) The overheating may be due to many causes, but probably the timing gear is worn as it is an old engine, and the exhaust valve lift is insufficient.

### Woolwich to Weymouth.

**?** Will you please give me the best route from Woolwich to Weymouth? As I am bad at following routes, please make it as explicit as possible.—T.H.

Your best route would be as follows: Woolwich, Blackheath, Catford Bridge, straight along the Bromley Road till you find the turning to Beckenham Hill, pass close by Beckenham Station, straight on to East Croydon. Just before reaching East Croydon Station turn left and go as far due south as you can. At the end of this road turn right and follow the road, which will lead you eventually into the main Brighton Road, close to Purley. Go straight on down the Brighton Road till you reach Redhill, here turn right and go through Reigate, Dorking, Gomshall, Shalford, Guildford, and over the Hog's Back to Farnham, Alton, Winchester, Ringwood, Wimborne, Dorchester, to Weymouth. For full and exact details of this route we should recommend you to become a

5s. touring member of the Auto Cycle Union, 89, Pall Mall, S.W., and apply to their Touring Department.

### Liners in Tyres.

**?** Would you be good enough to say: (1.) What the advantages and disadvantages are of fitting "liners" (in between the inner tube and outer cover, I understand) to motor cycle tyres? (2.) Do they really minimise the risk of puncture to any great extent? (3.) Do they ever cause the outer cover to "creep"? (4.) Are they really worth the time and expense of fitting?—H.G.S.

(1.) Advantages: Liners prevent puncturing. Disadvantages: They slightly slow machine owing to extra thickness of tread, and cause a certain amount of heat. (2.) Undoubtedly, if properly fitted and made of the right material. (3.) No, they cannot cause cover to creep. (4.) Yes, we think they are worth the time and expense of fitting, particularly if the machine be ridden in districts where the road surface is of a flinty nature.

ON THE SHORES OF DERWENTWATER.

Three Burnley motor cyclists on the return journey after a thousand miles holiday ride to John-o'-Groat's. The machines are two Douglas, 2½ h.p. 1910 pattern, and one 3½ h.p. Rex. Even the rugged pass and storm-swept roads of Glencoe were successfully negotiated, the return being made by Fort William and the coast route.

## Lubrication.

**?** I should be most grateful for your advice regarding the lubrication of my 6 h.p. twin J.A.P. engine. Would you kindly tell me: (1.) Whether you consider thirty spots a minute sufficient, as this is a hilly country? The engine appears to get enough, as it sometimes smokes, and on taking off cylinders I found plenty of carbon deposit on them and on heads of pistons. On the other hand I am not troubled with sooted plugs. (2.) I am inclined to attribute the overheating to defective carburation, it being impossible to give enough extra air with the type of carburetter with which it is fitted. Would this have the effect of causing the crank case to get so hot after a few miles that one can often barely hold one's hand upon it, and cause the engine to slow on quite ordinary hills?—R.W.C.

(1.) It is very difficult to give any fixed rule with regard to lubrication. You must be guided entirely by the behaviour of the engine. If you set the lubricator to give thirty drops per minute, and the engine smokes occasionally, probably the amount is too great. (2.) It is quite possible that the overheating might be due to imperfect carburation as you suggest. The crank case gets hot through conduction.

## A Model Specification.

**?** (1.) Among the many advertisements and illustrations of motor cycles, I do not remember seeing one of a three-speed chain-driven model. If there is any inherent objection to the type I shall be glad to know. I am considering the question of a motor bicycle, and for my purposes I need one that would require the minimum of attention and be ready for use in all weathers. (2.) The specification I have thought of includes 3½ h.p. Precision engine, Sturmey-Archer gear, Roman rims and spokes, Druid forks, Renold chain-drive in some form of cover. Is this a design from which one may expect hard work and plenty of wear, a light sidecar and eight stone passenger being carried? (My weight is eleven stone.) (3.) The by-roads of East Dorset are, in winter time, disgraceful. Would it be better to fit 2½ in. instead of the usual 2¼ in. tyres, or would the former slow the machine too much? (4.) From point of view of economy in petrol, how does an automatic carburetter compare with an adjustable one?—E.H.G.B.

(1.) There is no three-speed chain-driven model on the market except the No. 7 Chater-Lea. This machine is more especially for sidecar use. There is, however, no possible objection to this type. (2.) Your specification is a very practical one, and should be quite capable of taking a light passenger and sidecar. The three-speed gear mentioned is not made for chain transmission, and it would not be advisable to use a chain drive with this gear. (3.) By all means fit 2½ in. tyres if there is sufficient clearance. These will not slow the machine to any great extent. (4.) As regards petrol consumption there is little to choose between the automatic and hand controlled carburetter.

## Machine for Commercial Work.

**?** (1.) What horse-power would be advisable for travelling (commercially) in all parts of Devon and Somerset? (2.) Would a single-cylinder be preferable to a twin? (3.) Would it be possible to carry samples (weight about 20 lbs.) on carrier without their getting a lot of shaking? (4.) What make or makes would you advise? (5.) About what would be the cost of running and depreciation of machine, cycling about 200 miles a week?—W.S.P.L.

(1.) A 3½ h.p. with a change-speed gear would do what you require. (2.) Whether you have a twin or a single-cylinder is a matter really of taste. (3.) There will undoubtedly be a certain amount of shaking on the carrier, but the only thing to do is to have the box in which the samples are carried sprung in some way or other. (4.) We regret we cannot recommend any particular make, but if you care to ask our advice about any one which you think would suit your purpose, we shall be glad to advise you concerning it. (5.) The cost of running a 3½ h.p. would be about 2d. per mile, and 5 to 6 h.p. about 1d. a mile. The depreciation depends upon the make of machine, as some makes depreciate more than others.

## Belgium and Germany.

**?** I should like to take my Douglas motor cycle with me to Zeebrugge (Belgium) for my fortnight's holiday. (1.) Should I be exempted from duties if I joined the A.C.U., and would they arrange my passports and give me the necessary instructions? (2.) Are the roads good (equal to the English ones)? (3.) Should I have to pay duty again at the German frontier? (4.) What is the price of petrol per gallon in Belgium? (5.) Should I have to take spare tubes with me on this trip? In England I never carry any.—D.H.W.

It would be advisable for you to join the Auto Cycle Union, or some similar body, and they will help you greatly in your journey. (1.) Membership of the A.C.U. exempts you from paying duty, and they will arrange your driving licences before you start. (2.) The roads in Belgium are likely to be bad, but there is a path at the side, which is not supposed to be used by motor cyclists, but we should advise you to make use of it. Down the Rhine the roads are exceptionally good—quite as good as, if not better than, those in England. (3.) At the German frontier, or before you leave England, you will have to pay a duty, as this is one of the countries which does not allow motor cycles in free. You also have to take out a "steuernkarte," which costs a few shillings, and is available for a few days or a month. (4.) The price of petrol is 1s. 8d. a gallon in Belgium, and less in Holland than in England. (5.) You would do better to take spare tubes, as you might have difficulty in getting the correct size abroad.

## EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.A.L." (Transvaal).—8 h.p. 6 cwt. cyclecars for rough roads of South Africa. Reliability and petrol consumption.

"Friction" (Forfar).—Model K 1912 Douglas Clutch and change speed gear.

"O.B.P." (Aldershot).—G.W.K. cyclecar. Reliability and hill-climbing.

If "H.W.S." (Oxford), "J.M.E." (Lexden), "C.H.M." (Weston-super-Mare), "A.B.C." (Bromley), "J.G." (Bromley), "J.S." (Scunthorpe), "G.H.J.S." (Uckfield), "C.P." (Ashton-under-Lyne), "A.E.M." (Banff), "Dako" (Cardiff), "J.A." (East Ham), and "S.G.T." (Leek), will comply with our rules and send stamped addressed envelopes, they will receive answers to their queries.

Grosvenor M.C. hill-climb at Heyden Bridge. — Wood (Levis) travelling well at the start.

**A Belt Punch.**

This belt punch, which is adapted to hold securely belts of varying sizes, consists of a frame A having flat sides. Screwing through one side is the drill or punch, which is operated by a screw B. The belt C is held in position by a plate D, which is recessed to receive the sides of the frame A as illustrated, the plate being moved to hold the belt by means of a second screw device E.—R. T. Shelley, No. 19,310, 1911.

**A Light Vehicle.**

The accompanying plan and elevation show the general arrangement of a light car, the engine A of which drives, by a propeller-shaft B, to a counter-shaft C, provided with a pair of expanding pulleys D, driving by belts E to the rear axle F, the tension of the belt being regulated by moving the counter-shaft C bodily. This counter-shaft is carried on runners between guides. The details of construction are not suitable for reproduction in the form of an abridgment, but are fully set forth in the specification.—F. W. Vallat, No. 91, 1911.

**A New Sidecar.**

Mr. E. Bowser, who claims to be the original designer and maker of the solid reed cane sidecar body, has commenced business on his own account at 50, Park Lane, Leeds. He is marketing a new pattern sidecar.

**Parts for Old Pattern Werners.**

We occasionally receive enquiries from readers who possess old pattern Werner motor bicycles, and who are in need of spare parts. They will be interested to know that they can obtain parts for every type of Werner motor bicycle if they communicate with The Car Agency, Ltd., 175-176, Piccadilly, W.

**Accessories—Deferred Payments.**

Hitchen's Motor Exchange, Morecambe, inform us that they are relinquishing their accessories trade and disposing of the stock at big reductions. A feature of the business during this year has been the sale of machines on deferred payments, from 1 1/4 to 2 1/2% being charged for the accommodation according to the length of time over which the amount is spread.

**Imitation Jets.**

We are again asked by the makers of the B. and B. carburetter, Brown and Barlow, Ltd., to point out to readers that there are several imitations of the genuine Brown and Barlow jets on the market. As these in many cases will not fit their carburetters at all, they find it necessary to warn motor cyclists against buying them. The cases of genuine B. and B. jets have "Brown and Barlow, Ltd., Birmingham," on the outside, whilst the imitation ones have simply "Jets for B. and B. carburetters."

**A Sight-feed Lubricator.**

In this device the glass cylinder A is arranged horizontally, being clamped between end plates B C by means of a stud D screwing in a hollow boss E carried

by the end plate C. The end plate C is formed to receive a needle valve F, which is provided with a screw thread for adjustment purposes, a locking device (not shown) being fitted. The oil, which may be either pressure fed or induced by the suction in the crank case, passes in at G, and travels along the tubular boss E and through a tube H, where by means of the glass cylinder it can be readily seen, passing to the engine through the passage J.—W. Douglas, No. 23968, 1911.

**A Petrol Gauge.**

To the side of the tank A is attached, by riveting or otherwise, a frame B having a transparent diaphragm C. The enclosed chamber thus formed communicates with the interior of the tank by holes D E, resulting in the level in the gauge always corresponding with that in the tank.—C. A. Allison (H. and A. Dufaux et Cie.), No. 6,443, 1912.

**SPARKLETS****A Locally-built Mount.**

The machines ridden by W. Hodgkinson and H. Potter, who secured first and second places in the five miles open handicap at the Cambridge Charity Sports on the 4th inst., are made by the Cambridge Automobile and Engineering Co., Ltd., 21, Hobson Street, Cambridge, and are called the "Caeco." The engine, which is manufactured by the above firm, is a single-cylinder 85x85 mm., and the machine is built on standard lines with a dropped frame, chain driven, magneto, stand, and carrier.

**Scientific Selection of Lubricants.**

The Stern Sonneborn Oil Co., Ltd., make use of a very scientific testing machine for the purpose of selecting the most suitable qualities of lubricant for various kinds of work. The speed of this machine can be varied to produce the equivalent of from 50 to 3,000 r.p.m., and the pressure on the bearing surfaces can be varied from 1 lb. to 750 lbs. per square inch. At the same time the temperature can be raised from that of the frictional surfaces, when at rest, to about 850°F. This machine can be inspected at the offices of the firm, Royal London House, Finsbury Square, E.C.

**Collapsible Luggage Valises.**

Bright and Hayles, 73, Church Street, Camberwell, S.E., claim to be the originators of the collapsible metal luggage carriers and valises, having placed the Colapsi on the market in May, 1909.

**Catalogues Received.**

The catalogue issued by Messrs. R. G. Nye and Co., 16, Hampstead Road, Tottenham Court Road, London, W., shows that they specialise not only in complete machines, new and second-hand, but also in engines, gears, and many other things. Any motor cyclist desiring to fit a new engine can obtain a good price for his old one in exchange. The repair department undertakes all kinds of repairs and replacements, converts old machines to magneto ignition, and cuts down frames, etc.

This is the first year Alfred Dunhills, 359-361, Euston Road, N.W., have issued a separate catalogue for motor cyclists. It is a publication well worthy of such a firm. A speciality is made of motor cycle clothing, and a section is devoted to lady's clothing and headgear. Numerous accessories are also included, and not the least interesting part of the book is a trouble-hunting table.

One of the most comprehensive catalogues dealing with complete machines and accessories is that issued by Messrs. Hunts, Ltd., 117, Long Acre, W.C. Many well-known makes are illustrated, and special attention is given to sidecars, no fewer than five pages being devoted to these popular passenger attachments. The list of accessories is extraordinarily complete, and any enthusiastic motor cyclist will read the catalogue with great interest.

# CLIPPER

## MOTOR CYCLE ACCESSORIES

### THE "CLIPPER" BELT. FOR MOTOR CYCLES.

$\frac{5}{8}$  in. .. 1/5 per ft.       $\frac{3}{4}$  in. .. 2/- per ft.

# IMMEDIATE DELIVERY

AT FROM £10 DOWN.

Scotts, P. & M.'s, Bradburys, Zeniths (single and twin), Humbers, Matchless, Bat-Jap, Douglas, Premier, Clyno, Morgan Runabouts, A. C. Tricars, G. W. K.'s, Rex-Jap, Mo'sacoche, Lincoln Elk, Ridges, Triumph, etc., etc.

This we MEAN! Some people with three or four machines will advertise quite as good a story! With US we have the Agencies, Contracts running, and are, financially, in a position to take up the machines when the makers have them ready for delivery, and have them in stock for your acceptance when you are ready to buy them.

At the present moment £5,000 won't buy what we have in stock—at the Stations and at the Works. There is no need for you to wait while we write to ask the makers when they can deliver. They have already delivered, and the machines await your acceptance.

If you don't want to deal with us on account of the distance, ask your Local Agent to write us for terms. We will supply you through him with pleasure, and he can then give you lessons in riding, and any other assistance that you may require.

We have been telling you for three years a similar story—that we have the largest stock in the world—and we now confirm same.

We have also told you that we can supply you with a brand new machine for from £10 down, with very little extra added for the accommodation. Or, again, if you are a cash buyer, we shall be glad to have your esteemed commands for same.

We have a few second-hand machines still on hand, and a few hundreds of pounds worth of accessories, which must be sold! Look in the miscellaneous advertisements of this paper for a list of accessories. Write us for a complete list of Motor Cycles and Accessories, issued each week. Please let us have YOUR OFFERS. The stuff is going, but there is still plenty left, and if you will only make us a firm offer, we can supply you with anything you want, we feel quite sure.

Before starting to build up your Motor Cycles, write to us for parts. If you are in the Trade, our terms will suit you whether for new or second-hand machines or Accessories. Remember, we want your orders.

You cannot do better than come to Morecambe for your Holidays.

**SPECIAL OFFER.**—To move the Stock before the month is out, we offer any size of Morecambe Rubber Tyres at 11/11½; ditto, Studded, at 14/11½. All guaranteed, and on approval against Cash.

REMEMBER THE ADDRESS—

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Northumberland, Cumberland, Durham, and Westmorland.

York and Lancashire.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, ad. will be charged for registration and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear on the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe and Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

**ENFIELD, 2 1/2 h.p.**, 1910's, second model, special machine, engine just re-bushed, overhauled, new valves and rings fitted, little used, appearance like new, perfect; £25; buying sidecar machine.—Heath, Clontarf, London Rd., Leicester. [X7473]

**TRUMPHS**, two 1912 free engine models in stock; one 1911 free engine Triumph, Whittle, Lucas, etc., complete as new, £42/10; one 2 1/2 h.p. twin, in perfect condition, Whittle belt, footboards, £25.—The Stamford Garage, Stamford. [X7818]

**TRUMPH, 3 1/2 h.p.**, 1909, thoroughly overhauled, Lucas pump, nearly new Kempshall's, splendid condition, 7/12 Corah, overhead tap, 90x77, first-rate condition, do over 60, Corah tyres, £40.—Auto Repairs Co., 11, Field Place, Barnall Lane, Coventry. [X7497]

**TRUMPH, 1909**, good condition, not ridden since September, Continental back cover, butt-end tube and front cover, Continental belt, all hardly soiled, new lamp, horn, tools, 226; Jones speedometer, 1,000 miles, £2 extra.—Allen, jeweller, Market Harborough. [X7767]

**TRUMPH, 1910**, just been thoroughly overhauled by makers, many 1912 improvements, including new butter, piston, engine pulley, handle-bars, belt, etc., in condition, Lucas lamp, many spares, not done since overhauled; owner bought car; £35.—Hollingside, Four Oaks, Warwickshire. [X7652]

**SECTION V.**

**ork, Suffolk, Cambridge, Huntingdon, Bedford.**

**CL. P.N.**, in first-class order and condition, like new; £17.—3a, Bridge St., Cambridge. [X7500]

**3 1/2 h.p. Triumph**, standard model, in good going order; £25.—37, Searle St., Cambridge. [X7501]

**CLAS, 2 1/2 h.p.**, 1911, peerless order; bargain; 7/10.—Garnham, 96, Crown St., Ipswich. [X7661]

**Enfield Lightweight**, 1911 model, splendid condition; £24, bargain; no offers.—Hodden, Thetford. [X7838]

**TRUMPH Free Engine Models** in stock for immediate delivery; £55.—Townsend Cycle Stores, 1, Edmunds. [X7936]

**CLAS, 1911**, almost new, fully equipped; cost immediate delivery; what offers?—C. Fuller, Huntingdon. [X7803]

**1911 B.S.A.**, 600 miles only, genuine machine, absolutely like new; £38/10.—Staff-Sergt. A.O.C., Fricks, Ipswich. [X7985]

**h.p. inclined Minerva**, just overhauled, condition good.—Shorley, 25, Bower St., Bedford. [X7764]

**late 1911, 3 1/2 h.p.**, free engine model, splendid order; £37.—Garnham, 96, Crown St., Ipswich. [X7813]

**REVE Twin, 2 1/2 h.p.**, adjustable pulley, spring, exceptionally fine order; £17, bargain.—Garnham, 96, Crown St., Ipswich. [X7815]

**S Advance**, in good condition, mag., B. and B. h.b.e.; £16.—Liddiard's, Downing St., Cambridge. [X7843]

**3 1/2 h.p.**, free engine, and var. gear; £50.—Liddiard's, Downing St., Cambridge. [X7844]

# MOTOR BICYCLES FOR SALE.

**TRIUMPH, 1912**, F.E. model; immediate delivery.—Sole district agents, Crabtree's Garage, Wisbech. [X6846]

**ALLDAYS, 1912**, standard 3 1/2 h.p. model, magnificent value, beautifully finished; 40gns.—Crabtree's Garage, Wisbech. [X6847]

**HUMBER, 1912**, 2 h.p. lightweight, 2 1/2 h.p. twin 3-speed, 3 1/2 h.p. 2-speed.—Crabtree's Garage, Wisbech. [X6848]

**DOUGLAS, 1910**, standard model, just overhauled and in good condition; £25.—Crabtree's Garage, Wisbech. [X6849]

**ROVER, 1912**, Triumph clutch, used personally for few hundred miles, fully equipped as new; what offers?—Crabtree's Garage, Wisbech. [X6850]

**INDIAN, 1910**, 5 h.p., just overhauled and in fine condition; cheap to clear, offers wanted.—Crabtree's Garage, Wisbech. [X6851]

**BRADBURY, 1912**, latest model, with Sturmey 3-speed gear; early delivery.—Crabtree's Garage, Wisbech. [X6852]

**NEW Hudson, 1912**, 3 1/2 h.p. J.A.P. engine, 3-speed gear; immediate delivery.—Crabtree's Garage, Wisbech. [X6853]

**3 h.p. Rex Motor Cycle**, mag., h.b.e., low, light, and fast on hills; £17/10.—P. Riddelsell, Boxford, Suffolk. [X7827]

**MOTOSACOCHE, 1909**, 1 1/2 h.p., splendid order throughout, engine perfect; any trial; good reason selling; £10.—Groom, Snape Bridge, Saxmundham, Suffolk. [X7622]

**1912 Bradbury, 2 speeds**, free engine, also Bradbury sidecar, fitted with child's seat, all new; cost £67, exchange Morgan, A.C., G.W.K.—127, London Rd., King's Lynn. [X7817]

**TRIUMPH, November, 1908**, just overhauled, new piston, etc., perfect condition, lamp, watch, new belt, good tyres, all spares, overalls; £28.—Jeffries, Acton Sq., Sudbury. [X7887]

**6 h.p. 1912 Zenith**, ridden under 1,000 miles, F.R.S. lamp, Lucas horn, mirror, spare Whittle belt and other spares, plating and enamelling and generally as good as new; bargain, £57.—Robinson's, Green St., Cambridge. [X7848]

**BROWN, 3 1/2 h.p.**, mag., engine recently completely overhauled, good running order; £15.—Robinson's, Green St., Cambridge. [X7849]

**2 h.p. Humber, 1912**, quite new; price to clear £32/10.—Robinson's, Green St., Cambridge. [X7850]

**CLYNO, 5 1/2 h.p.**, just delivered, immediate delivery; £63/5.—Robinson's, Green St., Cambridge. [X7851]

**TWO 1912 Free Engine Triumphs**, just delivered, no waiting; £55.—Robinson's, Green St., Cambridge. [X7852]

**LADY'S Douglas, 1911**, 2-speed gear, handle starting, ridden under 1,000 miles, lamp, horn, speedometer, etc.; £38.—Robinson's, Green St., Cambridge. [X7853]

**DOUGLAS, late 1910**, complete, very little used, tyres quite new; £27.—Robinson's, Green St., Cambridge. [X7854]

**ROBINSON'S Motor Bicycle Garage**, Green St., Cambridge, Triumph agents. Tel.: 388. T.A.: Bicycles, Cambridge. [X7855]

**BEST of Everything**—Racing J.A.P., 8 h.p., overhead valves, Chater-Lea frame, Daniels, Powell-Hammer, spares, do nearly 80, 8 months old, not done 1,200, owner always uses car; cost £75, £40 or very near quick sale; perfect tune.—Apply, Guy Straker, Jesus College, Cambridge. [X7660]

**SECTION VI.**

**Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.**

**1912 T.T. Roadster Triumph**, ridden one week only; £45, or nearest.—Weale, Leominster. [X7773]

**1912 Scott**, lamp, generator, accessories, condition perfect; bargain, £55.—Hinton, Pen-y-Lan Rd., Cardiff. [X7761]

**IMMEDIATE Delivery** Bradbury standard, also Premier, 3 1/2 h.p., free engine, 1912 models, brand new.—Hereford Motor Co., Hereford. [X7510]

**1912 3 1/2 h.p. James**, free engine, run about 150 miles, almost new, complete, Lucas lamp, horn, and spares; £47/10.—1,020, The Motor Cycle Offices, Coventry. [X7816]

**1911 Triumph Roadster**, first-class condition, new Dunlop cover and belt complete, F.R.S. lamp and generator; approval, deposit; £38, or near offer.—Box 1,018, The Motor Cycle Offices, Coventry. [X7772]

**SECTION VII.**

**Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants, and Channel Islands.**

**BRADBURY, 1912**, free engine model, brand new, shop-soiled only; £49.—Ginger, Motors, Banbury. [X7699]

**TRIUMPH, 1912**, free engine model, new; in stock, immediate delivery; £55.—Ginger, Motors, Banbury. [X7700]

**MOTOR Cycle**, Alldays and Outons, 2 1/2 h.p., running order; low price.—Sewrey, Market Place, Reading. [X7634]

### The Industry Abroad.

WITH the motor cycle industry in such a flourishing condition in this country, it will be interesting to contrast the state of the trade on the continent of Europe, where the manufacture of motor cycles was, some years ago, of the greatest importance. The pastime is reviving in France, where the motor cycle trials organised this year have met with a very fair amount of support from English competitors, and next year the promoters of these events are counting on further assistance of the same kind, one of their sporting allies having recently sent a contributor specially to England to visit the various manufacturers and stir up increased interest in this direction. This representative visited the important centres of the industry, and went home very favourably impressed with all he saw and heard.

As a contrast, let us turn to Germany, where the motor cycle industry is in a really bad way. In that country there are practically only two important firms left to manufacture motor cycles. We recently received a visit from a German gentleman, a member of a London motor cycle club and a most enthusiastic rider of a British-made machine. It was he, his brother, and some friends, all keen riders of British machines, whose mounts were barred from a German competition quite recently because they were of British manufacture, mention of which was made in *The Motor Cycle* a few weeks ago. We are fairly well acquainted with Germany, both its country and its people, and have a sincere admiration for the industry of the latter and the sound lines upon which the former is run. We cannot, however, congratulate the

Germans so far as the motor cycle industry is concerned, on that characteristic thoroughness which we have always been wont to attribute to them in other matters.

This branch of automobilism, which is assuming such large proportions in England and is showing signs of springing into a new lease of life in France, is being throttled out of existence in Germany by means of the short-sighted policy of the few clubs which exist and the arbitrary attitude of the Government. The taxes a motor cyclist has to pay are perfectly exorbitant, and by the time the unfortunate rider has finished with the various fees and formalities he is the poorer by £10. Even the cylinders have to be taken off and the engine dimensions measured by the police. Of course there is a strong prejudice against this type of locomotion in Germany, but we have had the same thing in England, and prejudice can always sooner or later be overcome.

The most serious objection to the progress of the industry is, as we have said, the arbitrary attitude of the Government. However far ahead of other nations Germany may be in some respects, certainly as regards the motor cycle industry she has allowed herself to be pushed back to a very low position indeed. We do not say a word against the two surviving firms, who are really turning out excellent machines, but we do think the German Government might give what might be a thriving industry a fair chance to regain the ground it has lost.

Motor cyclists in this country think that they are hardly dealt with in being taxed £1 10s., but if we had to pay £10 the movement in Britain would barely exist.

# My Most exciting Ride: No. 8. F. A. APPLEBEE.

*Interrogated by L.C.*

IT is a curious fact that the most exciting incidents in a motor cyclist's career are often to be found in short pleasure jaunts, while races provide only those thrills which are common to all speed competitions. Frank Applebee, holder of the Tourist Trophy, gave me an incident in a little holiday spin, when I asked him for his most exciting ride. "It was on the London-Yarmouth road," he said, "while I was riding a Rex with a sidecar attached, in company with a friend similarly mounted. There are a lot of nice little straightaways on this road, and on one of them we paired up for an impromptu race. We soon got to a high speed and pelted off neck and neck. But gradually the road narrowed, and by the time I had noticed it, there was so little room that I found myself getting into the ditch. I didn't want to stop, and tore on, with both bicycle wheels in the ditch and the sidecar wheel on and off the ground.

## A Tight Corner.

"Soon the sidecar wheel began to leap higher, and I was so scared that I dared not take my foot off the rest to press down the pedal brake for fear of overturning. It seemed an age, whereas it could not have been more than a minute that I was in the gully, and why I did not throttle down goodness only knows. I seemed unable to do anything but sit tight and wait for the apparently inevitable. But at length I did the only thing possible, and shut off, with the result that I slowed down just in the ordinary way and came to rest wondering why I hadn't done so sooner. My companion was a good way ahead of me by this time, and there was I, just recovered from a state of abject terror over a trifle. In cold blood it may not sound very exciting, but I was never more thrilled. I have had other exciting episodes, but so far as my

racing career is concerned, it has just been methodical riding without any incident of note.

"This year's Tourist Trophy Race was the easiest I have ridden, and it is an interesting point that it was the first race I competed in since the T.T. of last year. Most of my work is done with a sidecar, but it doesn't take one long to get into a racing stride on a solo mount."

## An Early Experience.

I ventured to suggest to Applebee a little incident which is still fresh in my memory, but I think that he was less excited on this occasion than myself. Applebee was driving a Rex Litette in the Six Days' Trial of 1907, and I was his passenger. On the penultimate day, after five days' "blinding", which had kept us with a clean sheet we were confronted by a hefty wagger round a bend. Applebee took the Litette up the banking and came down in the hedge, slightly scratched, while I was thrown under bolting horses and woke up the next morning in Gloucester hospital suffering from concussion.

Applebee, by the way, was, in his early days, an amateur trick cyclist, no wonder he can show us something in the way of corner work. When asked for a few riding tips, Applebee said that the present-day motor cyclist was so efficient, that it was only necessary to sit on and let the machine do the work, so long as ordinary care in the garage was taken. The constructional or bicycle parts should be tended to more than they are, he said, for the average rider thinks so much about his engine that the frame suffers from neglect. A good tip he gave was to be careful about cleanliness, for, as he said, in cleaning the machine one apt to come across loose bolts and nuts which would otherwise be missed.

Frank Applebee, worthy son of a pioneer and principal in the firm of Godfrey and Applebee, Ltd.

## B.A.R.C. AUGUST MEETING.

The following entries have been received for the two motor cycle events at the above meeting on Bank Holiday. The first race is at 12.50 p.m.

S. D. Timson (1 cyl. Rudge)	C. Whitehead (1 Triumph)
W. Dewar (1 Triumph)	S. F. Garrett (1 Green-Precision)
G. E. Stanley (1 Singer)	B. C. Remington (1 Rudge)
W. T. Wartnaby (1 W.D.)	James Gibbs (2 Humber)
A. Brunton (2 Bat)	E. H. Dolley (1 Jap)
P. Newbold (2 Zenith)	C. Townsend (2 Zenith)
H. H. Square (1 Minerva)	

F. Picken (1 Rudge)
R. Croucher (1 Kerry)
"A. E. Pontin" (1 Rudge)
W. Stanhope-Spencer (1 Rudge)
W. H. Elce (1 Rudge)
S. Russell Cooke (1 Rudge)
A. P. Williams (2 Matchless)
N. D. Slatter (1 Alcyon)
P. Schmidt (1 Puch)
W. Gordon-Fowler (1 Rudge)

H. C. Mills (1 Green)
J. A. Manners-Smith (Triumph)
H. H. Huckle (2 Zenith)
F. H. Arnott (1 Rudge)
K. Yano (2 Bat)
E. F. Remington (2 Matchless)
W. Moore (2 Zenith)
F. Hannis (1 J.A.P.)

The Rex sidecar illustrated attracted much attention in the Midlands last week. Its owner, W. A. Gibbons, regularly tours with three up in the manner shown, besides which he carries many pounds of samples in his business as a builder. If this is not "overloading" a sidecar, it is certainly on the border line.

## NEWS via PARIS.

Sensational Reports which should not be taken too seriously.

THE correspondent of a French contemporary, *L'Aero*, has recently made a tour of the leading English motor cycle factories, and has written an article giving the following details he gleaned regarding impending developments at the Triumph, Rudge, and other factories. We do not confirm reports, but from the article we learn: That the Triumph Co. are bringing out a special 500 c.c. T.T. engine with overhead inlet valve, which will be used for record attempts and at important hill-climbs, and will make its first appearance in the C. de F. Grand Prix Race. That the Clyno Co. have a new cyclecar on the stocks which will be ready for the Show. This is to have four wheels, a four-cylinder water-cooled 12 h.p. engine, and will be marketed at about £100.

That the Rudge-Whitworth will introduce at Olympia a twin-cylinder two-stroke 7 h.p. engine, which will, so it is said, develop 14 h.p. on the brake.

That the Indian firm are contemplating an attack on the 500 c.c. world's-hour record with a special 3½ h.p. twin, to be ridden by C. B. Franklin.

That the Spanish agent of the Rudge firm has bet the Madrid agent of the New Hudson Co. £240 (presumably £240 to nothing) that a 500 c.c. Rudge will beat a New Hudson of similar capacity in a 600 miles race from Bilbao to Madrid and back.

That the race will take place on August 18th, and that Vernon Taylor will ride the Rudge.

That O. C. Godfrey and F. A. Applebee will compete in all trials next year organised by *L'Aero*.

That the English invasion is only commencing.

## COVENTRY CLUB'S OPEN HILL-CLIMB.

The regulations for the Coventry and Warwickshire Motor Club's seventh annual open hill-climb, to be held on Saturday, August 31st, have just been issued. There are eight classes on the programme as under:

- Class 1.—Touring lightweights up to 350 c.c.
- Class 2.—Touring machines from 350 to 500 c.c.
- Class 3.—Touring variably geared machines, with stopping and starting test.
- Class 4.—Tourist Trophy class.
- Class 5.—Touring sidecars and cyclecars.
- Class 6.—All comers.
- Class 7.—For members. Sealed handicap.
- Class 8.—Cars. Members only.

There will be a time and formula prize, the formula adopted being the one recommended by *The Motor*

$$\text{Cycle. } \frac{C \times T^2}{W}.$$

Applications for entry forms should be addressed to the hon. sec., Mr. Geoffrey Smith, 19, Hertford Street, Coventry.

Members' hill-climb of the Sutton Coldfield A.C. F. S. Whitworth (Douglas) finishing at a fast speed. He was placed second on time in Class I.

## Occasional Comments by "Ixion"

### Clutch Control of Three-speed Hubs.

A difficulty in connection with three-speed hubs is concerned with the clutch control, especially when these gears are fitted to machines not designed for the purpose. There is a great strain on the spindle carrying the clutch pedal, the spindle being normally bolted to the front down tube of the frame. The spindle screws into the frame-clip, and the action of engaging the clutch causes the spindle to unscrew, thus disturbing the adjustment of the clutch rod, and causing the free engine position to be lost.

The gear makers have lately brought out a new type of clip, on which the spindle projects and carries a lock-nut; but this remedy is worse than the disease, as the strain now causes the clip to twist round on the tube. I prevented this twist by fitting grub screws right through the clip into the tube, but found that the grub screws were apt to shear. I then saw the necessity of supporting the spindle at two points. On my machine its outer end passed within an inch of a particularly solid exhaust pipe, and by inserting a shaped metal block into this gap I gave the spindle a two-point bearing, and absolutely prevented any movement.

The metal padding block should be of large dimensions, and should half encircle the exhaust pipe, otherwise the pipe will be dented.

### Four-speed Gears.

I should not like to say that the four-speed gear is going to supersede the three-speed, but in theory the more speeds we have the better, and if a light and reliable four-speed gear can be produced, it must be more useful than a three-speed, and in a recent article I indicated that a four-speed gear was likely to be tried.

Last week I received particulars of a light four-speed gear, with which belt slip is practically impossible, as the front pulley is half the diameter of the rear pulley.

In the case of a three-speed gear where the direct drive is the intermediate ratio, if an engine pulley of rational diameter be employed, the top gear will be about 3 to 1, which is in no sense a genuine roadster gear, and is only suitable to a  $3\frac{1}{2}$  h.p. single-cylinder engine for scrapping purposes down a gentle grade. The four-speed gear will afford this high ratio for special purposes, a  $4\frac{1}{2}$  to 1 gear for normal running, a  $6\frac{1}{2}$  to 1 for bad hills, and a 10 to 1 gear for restarting on hills or hauling a sidecar up precipices.

### The Right Side for Speedometers.

I am considerably surprised that most speedometers are constructed for attachment on the right hand side of the front wheel. It is often a matter of delay and difficulty to obtain a near side speedometer from certain firms. After all, most riders use the left hand for one-hand steering, and consequently prefer to mount their hooter on the right side. If a big-hooter and a heavy speedometer are both mounted on the right-

hand half of the steering bar, the machine has a very lopsided appearance which is deleterious. Surely the correct side for a speedometer is the *near* side? I am aware that some speedometers have a reversible transmission, but I am generalising in the above paragraph.

### Wanted, a Belt Repair Kit.

The custom nowadays is to sub-divide the toolkit. One or two of the tyre specialists have marketed delightful little strap-on wallets containing a set of levers, solution, etc., and it is a great convenience to be saved dismantling the entire toolkit when a puncture has to be mended. I understand this wallet is first-rate selling proposition, and I think the belt people would do well to market a similar miniature wallet for repairing belts, such wallet to contain spare fasteners, length of belting, punch, knife, screwdriver, and belt spanner.

The pair of standard pannier toolbags provided by manufacturers with such unanimity to-day are only just large enough to hold the main kit. For instance, my own off-pannier contains a large tool-roll; my near pannier contains two valves, two plugs, and a case of three-speed gear bits. I have to accommodate both belt and tyre kit elsewhere, and thousands of riders are in the same position.

### Backlash in Epicyclic Hubs.

One unpleasant feature of almost all epicyclic hubs is the amount of backlash existing between belt rim and hub. I took out such a machine the other day, and as it got away with me I fancied the strange engine was knocking badly. A little experience of its whine showed me that the noise really proceeded from the back hub, which clattered loudly until the revolute mounted up to a rate at which the dogs were kept pressed tightly forward. I know this complaint is as old as the hills, but I can recall at least one prehistoric hub, long since deceased, which efficiently surmounted this most displeasing noise. The only way to prevent it is never to start except on the bottom gear, and when rounding a sharp turn, if the engine power be low, the weight propelled, change down and then up again as soon as the corner is safely negotiated.

### The Air Throttle Start.

Can anybody say why no maker has yet standardised the shutter on a carburetter's main air opening, with the idea of simplifying engine starting and perfecting carburation? It seems to be an agreed fact that makers reduce the area of the main air orifices in order to ease starting, and so cause the mixture to be on the rich side at all lever positions, an inefficiency of partially remedied by reamering out the top air hole. The same result would be more perfectly obtained providing a tiny shutter (preferably operated from the handle-bar) for partially closing the main orifice. Such a shutter considerably facilitates starting in a form. Might it not pay some accessory house on the market such a notion in a form applicable to two or three of the most popular carburetters?

## THE Enfield Sidecar on the Road.

**A** MONTH or two ago we took delivery of a 6 h.p. Enfield sidecar combination, and since that time many enjoyable rides have been our lot. The Enfield, as may be recalled, first made its

appearance at the Olympia Show, and it was eagerly examined, as it had been produced to cater for the undoubted demand for a passenger machine capable of climbing all main road hills and averaging the speed of a good motor bicycle. Our experience is that the machine is able to answer all requirements in this respect, for it will exceed 40 miles per hour on occasion (though it must be confessed that no sidecar is comfortable either to sit upon or drive at this speed), and it will climb in 6 gradients on the low gear without taxing the engine to its utmost.

Section of the Enfield two-speed and free engine gear. It is of the internal expanding clutch type, the clutches being engaged by a pair of cams sliding in either direction.

The steering of the machine is splendid; no doubt the special construction and attachment of the sidecar to the bicycle accounts for this in no small measure.

### First Experiences.

Our initial experiences of the machine were not so happy as they might have been. On the occasion of the first long run the engine started at the first turn of the geared-up handle, but we could not persuade the low gear clutch to start the machine from a standstill, no matter how tenderly the lever (which is situated on the top tube) was engaged. Eventually Colver came to the rescue, and his advice, which we have always acted upon since, was gently to tap the lever rearwards. This method works fairly well, but the clutches are not so sweet in action as they might be, and no doubt will be on the 1913 model. At the end of that run we found sundry bolts and nuts missing, and we found it paid to go carefully over the

machine with a spanner at regular intervals. This precautionary measure would, however, be unnecessary were every nut split pinned or fitted with a spring washer as it should be. The slipping clutch on the engine-shaft, and the patent cush drive situated in the rear hub, undoubtedly conduce to the smooth running of the machine.

### The Engine.

The J.A.P. side-by-side valve engine has behaved exceedingly well throughout, though we have been troubled by broken valve springs—evidently some of a badly tempered batch. This model engine, with comparatively long stroke to bore ratio, viz., 76 × 85 mm., is a highly suitable one for passenger work, though one could wish that the noise arising from the valve tappets was not so pronounced.

But for these untoward experiences, the Enfield has behaved itself splendidly. What we have liked all along has been its ready response to the throttle lever. An eighth of an inch extra opening and away the machine will bound, a change of gear only being

The standard pattern 6 h.p. Enfield two-speed sidecar combination with cane body.

necessary on hills approaching single-figure severity. One secret of enjoyable running on a powerful sidecar is to have tyres well up to their work. The voiturette Dunlop on rear wheel has given entire satisfaction, though it is strange how luck varies. For instance, after a long spell of no trouble running, we experienced four punctures in one day in the front tyre—and it has never been blown up since.

A cane sidecar is supplied with the standard article having a torpedo front and cane door. A coach-built sidecar—which we prefer for powerful machines—may be obtained at slightly extra cost.

The petrol consumption with the Amac carburetter is not excessive considering the weight, power, and speed; 55 to 60 m.p.g. we find about the average.

# Scottish Six Days Reliability Trials

THE last issue of *The Motor Cycle* dealt with the performances of the competitors in the above trial up to Tuesday mid-day, where a stop was made at Pitlochry for luncheon.

On the first day, the run was *via* Stirling (first check), alongside Loch Lomond to Arrochar for lunch. In the afternoon competitors had to climb the famous Rest and be Thankful, and, owing to the loose and stony surface on the inside of the bend, many came to grief. The individual performances were detailed in our last issue, pages 843-4. The night was spent at Oban, the day's run being 166 miles.

There were exactly seventy starters of the seventy-five entrants, the actual competitors being as follows:

N. Soresby (3½ L.M.C.)  
R. A. Macmillan (3½ Scott)  
J. S. Holroyd (2½ Motosacoche)  
S. J. K. Thomson (8 Bat sc.)  
W. Pratt (3½ P. and M.)  
A. G. Fenn (2½ Humber)  
W. Creyton (2½ Humber)  
Frank Smith (5-6 Clyno)  
A. J. Sproston (3½ Rover)  
C. T. Newsome (3½ Rover)  
C. W. Munro (2½ Douglas)  
W. Houghton (3½ Bradbury sc.)  
J. E. Chisholm (3½ James)  
W. G. M'Minnies (3½ Triumph)  
J. F. Morrison (2½ Douglas)  
H. Gibson (3½ Bradbury sc.)  
G. Griffith (6 Zenith)  
E. B. Keiller (3½ Rudge)  
P. G. Edmond (3½ Humber)  
J. T. Wood (8 G.W.K. cyclecar)  
Bert. Yates (3½ Humber)  
L. E. Cass (4½ Quadrant)  
J. Steel (3½ B.S.A.)  
P. W. Bischoff (3½ Triumph sc.)  
J. R. Alexander (7 Indian)  
R. Lord (6 Rex)  
R. White (3½ Alldays-Matchless)  
C. M. Keiller (8 G.W.K. cyclecar)

M. Pratt (3½ Alldays-Matchless)  
W. B. Gibb (2½ Douglas)  
G. L. Fletcher (2½ Douglas)  
Duncan Bell (5 A.J.S. sc.)  
W. Westwood (3½ Triumph)  
G. Taylor (3½ Rudge)  
F. Begley (3½ Hazlewood)  
George Brough (6 Brough)  
Vernon Taylor (3½ Rudge)  
H. G. Dixon (3½ New Hudson)  
H. Berwick (3½ New Hudson)  
J. Donaldson (3½ New Hudson)  
R. S. Hood (6 Brough)  
A. F. Downie (3½ Ariel)  
N. W. Downie (3½ James)

L. Newey (3½ Ariel)  
F. C. North (3½ Ariel)  
A. D. Scott (3½ Triumph)  
T. P. Macdonald (4 Norton)  
G. E. Cuffe (7 Indian)  
C. W. Meredith (3½ Bradbury)  
J. Cocker (2½ Singer)  
A. J. Dixon (3½ Singer)  
R. Holloway (3½ Premier)  
J. Oliphant (3½ Premier)  
F. S. Douglas (8 Dot)  
R. G. Mundy (3½ Macbeth-Precision)  
B. A. Hill (7 Indian)  
G. T. Gray (3½ Rudge)  
A. U. R. Downie (2½ A.J.S.)

A novel air inlet pipe on Bert Yates's 3½ h.p. Humber. It will be seen that the main and auxiliary air inlets are connected by a pipe, with a single opening for the entry of air at the rear.

A. H. Alexander (2½ Douglas)  
G. Bell (3½ New Hudson)  
A. A. Hay (3½ Quadrant)  
T. Silver (3½ Quadrant)  
W. B. Little (3½ Premier)  
G. E. Whitehouse (3½ Rover)  
J. H. Begg (3½ Rudge)  
H. Le Vack (2½ Motosacoche)  
J. D. Morrison (5-6 Bat)  
P. E. Tolfree (3½ Bat)  
W. D. South (3½ Rudge)  
Miss Muriel Hind (6 Rex)

## Second Day, 179½ Miles.

Starting at 8 a.m., the competitors journeyed *via* Dalmally, Killin, and Aberfeldy to Pitlochry (lunch and control).

Later news unfortunately shows that the loose surface on the corners was productive of several heavy spills. Tom Silver skidded on a skew bridge near the Pass of Brander and cut his head open. Fortunately his accident occurred near the residence of Mrs. Campbell, whose husband is a claimant to the Dunstaffnage peerage, and she happened to have a trained nurse at hand who attended to his injuries. Munro sustained a similar mishap with his Douglas, knocking his front wheel into the shape of a kidney, and both men have retired. Houghton broke the axle of his Bradbury sidecar near Oban yesterday, and his passenger was somewhat hurt. Houghton is continuing solo. He started this morning with his passenger on the carrier, but left him at Dalmally after a skid and fall. Many other machines bear the mark of minor accidents. The fact is that the roads are nowhere suited to "making-up time," and as some of the roads do not admit of maintaining schedule speed, the competitors are always nervous about their time, and are usually

AT THE START. The seventy competitors were despatched in bunches of four.

Scenes at the first check at Stirling.

tempted to drive rather faster than is safe. Wood's G.W.K. cyclecar has lost marks through a most peculiar misfortune. The G.W.K. wheels are keyed to the hub shell, and one of his rear hub castings contained a blowhole just at the keyway. This gave way, and so one of his driving wheels began to run free. When last seen he was laboriously filing out a new keyway.

### The Afternoon Run.

This afternoon's run was deemed by the officials, and hoped by the competitors, to be the sternest patch of the entire trial, the route consisting almost exclusively of stony moorland tracks, and including several miles of single figure gradient with numerous perilous corners. From Pitlochry we cut across to Kirk-michael, commencing with a long pull very trying to small-engined sidecars, and containing three bridges nearly sharp enough to foul a crank case. Here we hit the Braemar road, which was in moderate order as far as the Spittal of Glenshee. The remaining fifteen miles may be tersely described as "eight up and seven down." The surface is sandy and stony, terrible in wet weather, as the riders in the 1910 trials well remember. The hill resembles "Rest and be Thankful." It contains little real gradient, but the long miles of collarwork exhaust an engine, and both sides of the pass were littered with spectators' cars and cycles, which had overheated and petered out short of the summit. A quarter of a mile from the top comes the ill-famed Devil's Elbow, a wicked double hairpin with a grade of perhaps 1 in 8, if taken wide, and 1 in 5 if the rider cut in on the inside.

The Motor Cycle representative and photographer were the only officials present when the stream of competitors appeared, all the other motorists accompanying the trial having been out-distanced. After we had observed a few men, an official car appeared, and the

judges asked me to race on to the scene of the next hill-climb. The climb is very deceptive, a length of 1 in 17 up grade below the corner appearing to be downhill, and it was amusing to see the three-speed men change up on to top, and to catch their expressions when their resentful engines began knocking. The first man up was C. T. Newsome, whose Rover had plenty of reserve power; apparently he did not stop to cool for the Elbow, as most of the others found it

advisable to do. Alexander's Indian had lots in hand, and cornered well. Steel hit the bank at the lower zig-zag, dismounted, and ran up alongside, stopping higher up. Thomson made a lurid ascent at high speed with his Bat sidecar, using the grass as banking for the side wheel, and nearly leaving the road with a giant skid at the upper corner. Quite a number of competitors found this bend too much for them. I now hurried on to the scene of the next climb.

ALLARGUE BRAE, LOCALLY KNOWN AS COCKBRIDGE LADDER.

A competitor on the narrow and twisty hill near Balmoral Castle, known as Cockbridge Ladder. The surface is composed of deep, loose sand.

**The Scottish Trials.—**

Vernon Taylor (Rudge): Very good.  
Westwood (Triumph): Good.

Steel (B.S.A.): This rider stopped; legging proved useless, and he was pushed.

Brough's low compression twin made light of the hill, and is the only single-gear machine at all equal to the Scottish grades.

Edmond (Humber): First-rate, but Yates had little to spare.

Gibb (Douglas) shot up with a gigantic skid on the bend; judging by the shouts he mistook the road and drove into the farm yard at the second corner.

Cuffe (Indian) seemed anxious, in spite of his 7 h.p., and kicked hard with his feet.

Begley (Hawlewood) had to run along-side on both the lower bends.

Berwick (New Hudson) and Newey (Ariel): Very good.

Macdonald (Norton) misjudged the corner, cutting in badly, but his engine did not mind, and he went up well.

Begg (Rudge) came up at a ridiculous speed, and took a toss: his second shot was very good.

Pratt's Alldays was rather slow, in fact it just got up.

Keiller's G.W.K. cyclecar made a magnificent climb with abundant power in hand.

Downie's Ariel roared up, but the clutch slipped on the bend, and he dismounted with his engine racing.

White (Alldays): Especially good in view of the wagging of his buckled wheel.

Mundy steadied his Macbeth with his foot, but had power to spare: the same applies to North (Ariel).

Holloway's Premier reproduced its previous good form on the other hills.

The Clyno climbed finely: Frank Smith eyed the bad rut with comical resentment after his bad skid.

Donaldson legged to steady himself.

Morrison (Bat): Neat and workmanlike.

Miss Hind (Rex): Splendid.

Cocker (Singer), Vack, Lord (Rex), and Houghton (Bradbury) rushed up in a clump, leaving poor Vack stationary, exhausted by pedalling. Houghton's sidecar and passenger had been abandoned, as described above.

Gray (Rudge) and Downie (A.J.S.) rushed up with speed and neatness: the

latter's 2½ h.p. is doing excellently. The big A.J.S. and sidecar had an ugly smash this morning owing to the handle-bar coming loose on a corner. Both men were rendered unconscious, and the passenger was an hour coming round. They pluckily repaired, and got into Grantown after dark.

Bischoff turned into the hotel yard after twenty yards of the hill; while he had a drink and lowered his gear, Miss Langston walked up the hill. Bischoff ran and was helped by a pusher on the opening portion, but his single-cylinder must have done well, for he finished the day's run with four minutes in hand. The hills were trying his Triumph, chiefly owing to the collarwork between climbs.

**An Unfortunate Collision.**

Alan Hill was very late. As he coasted down into Braemar, a competing Rover and a non-competitor charged him over from behind and broke his handle-bar; half of it was, so to speak, hanging by a bit of skin. This upset his Indian grip control, and with bad roads and fierce corners, he did well to proceed.

Whitehouse's single-gear Rover and Hood's Brough both appeared very late, and their engines failed low down. When I rode up the hill later, both men lay exhausted on the bank halfway up, while kindly spectators pushed their machines up.

From the summit into the finish at Grantown was a long surfeit of severe climbs, hair-raising descents, and bad surfaces. Eight miles out I thought my machine was bumping a little more than usual, and dismounting to examine my tyres, found both down, the front cover gashed through with a stone, the back one gashed, and pierced by a nail in addition! This gave me a total of seven punctures for the day!

**Marks Lost on Tuesday.**

There was a big list of retirements and lost marks on Tuesday evening after such a severe day's running. Those who withdrew during the day include: C. W. Munro (Douglas), W. Houghton (Bradbury sc.), H. G. Dixon (New Hudson), T. Silver (Quadrant), W. B. Little (Premier), A. D. Scott (Triumph), and A. A. Hay (Quadrant).

J. E. Chisholm (James) lost 60 marks (maximum), E. B. Keiller (Rudge) 60,

J. T. Wood (G.W.K. cyclecar) 60, L. E. Cass (Quadrant) 60, J. Steel (B.S.A.) 18 Duncan Bell (5 h.p. A.J.S. sc.) 60, G. Taylor (3½ h.p. Rudge) 60, G. E. White house (3½ h.p. Rover) 54, H. Le Vack (Motosacoche) 13, P. E. Tolfree (Bat) 60, F. E. Douglas (8 h.p. Dot) 60. A J. Sproston (Rover) and G. Brough (Brough) held over, cards illegible.

**3rd Day, Wednesday, 211½ Miles**

Route: Grantown, Inverness, Dingwall, Bonar Bridge, Lairg, Aulnabarra, Hope Eriboil, Tongue, and Thurso.

To-day's route was a real rim-denter, and we are now all used to riding over rough stones. Our starting number was slightly impaired this morning, as last night's list shows. Graham Dixon's gudgeon pin bush came out through the cylinder wall yesterday, and he has trained home. Thomson broke the stem of his forks a mile or two outside Grantown last night, but inserted a liner, and got through to-day's run rather late.

We left Grantown in fine weather, but rain began to fall as soon as we joined the classic End-to-end route. Of course it is usually raining in Inverness, but for once there was no dangerous grease—Inverness keeps a special side-slipping brand all its own. The rain cleared for the day at Beaulieu—also as usual.

For the first thirty-five miles there were no incidents except a few spills on the new unrolled metal which covered the road from edge to edge in places, and a remarkable number of punctures. In Inverness, Wood hit a sheep with his G.W.K. cyclecar and had to pay £2 for it, besides shearing his wheel key again by violent braking in the effort to avoid the animal. A cattle fair was in progress at Dingwall, and the droves necessitated many dismounts. Over Aultramein Hill there was a novel surface composed of innumerable very small stones, which caused our back wheels perpetually to dry skid three inches or so, and made the riders look very curious when viewed from behind.

At Bonar Bridge we quitted the record route, turning sharp left, and the going for eleven miles into Lairg was rather queer, and included a few minor gradients. An excellent lunch prepared us for the strenuous work ahead.

CLIMBING REST AND BE THANKFUL, THE FIRST TEST HILL.

One of the less fortunate competitors, who did not follow the outside edge.

Geo. Griffiths (8 h.p. Zenith, who made a good climb, and another competitor in the act of falling.

Miss Hind (6 h.p. two-speed Rex) who stopped in the stones, but restarted on the clutch.

## GREAT BARGAINS IN TYRES.

Having purchased a manufacturers' stock of new Covers and Tubes, we are able to offer the following makes at greatly reduced prices.

Clincher A. Won rubber-studded covers, 26 x 2 1/2 in., 29/11, usual price 31/7. Westwood rubber studded, 26 x 2 1/2, 23/11, usual price 30/6. Westwood heavy tri-car, 26 x 2 1/2, 35/-, usual price 47/-; ditto, 26 x 2 1/2, 38/6, usual price 51/-. Clincher Inner Tubes, 26 x 2, 6/11, usual price 11/4. Westwood, 26 x 2 1/2, 7/3, usual price 9/9; ditto, heavy tri-car, 9/3, usual price, 11/9. All New Goods. Postage on covers, 8d. extra, tubes 4d.

## THE HUNT NEW MODEL COMPACT VALISE.

Length, 18in.; width, 11in.; depth, 6in. Manufactured of finest cowhide. Strengthened inside with strong hide-covered metal bands, and at the bottom with two wood batons which prevent bag being chafed by carrier. The inside is lined with a strong twill, and the outside is fitted with two spring lever locks and handle. The bag is strongly riveted throughout, and it is impossible for it to lose its shape. The handle enables it to be also used as a Suit Case. Fitted with two leather straps 48x2in. for attaching to carrier. The motor cyclist can carry sufficient clothing inside this case to last him for a fortnight's tour. On arriving at his hotel, the bag can be taken to his room as an ordinary portmanteau. Finished in dark nut-brown leather. Price 30/-.

## THE WESTWOOD specially prepared Repair Bands.

For use on outside of cover after same has burst or been gashed. The outside edges are tucked inside rim, i.e., between rim and cover.

Price 1/-, postage 2d. Ditto for inside, 8d.

The Hunt Hellesen Dry Cell. No corroding terminals. No acid. No charging. Always ready, clean, and dry. The "Flash." Height 6 1/2 x 4 1/2 x 2 1/2 in. Approx. mileage with single-cyl. engine, 1500. Price 6/6. The "Flight," ditto, Height 5 1/2 x 5 1/2 x 2 1/2 in. Price 6/6. The "Midget," emergency ditto. Height 5 1/2 x 4 1/2 x 1 1/2 in. Will run approx. 300 miles. Price 4/4. Postage 8d. extra.

## THE HUNT EXCELSIOR WATCH AND HOLDER.

Weather and dust-proof case. Watch guaranteed to stand vibration. Can be wound and adjusted without removing from the case or handle-bar. For attaching to the handle-bar.

Price 5/6. Postage 2d.

## THE HUNT Valve Spring Remover.

By means of the compound action the stoutest spring is easily raised by a slight turn of the winged nut, leaving both hands free.

Price 2/6. Postage 2d.

Triumph, 1910 Model, in perfect running order, complete with lamp, horn, and accessories; price £32 0 0

## 1912 MODEL SIDECARS in stock for Immediate Delivery.

### THE HUNT 1912 IMPROVED MODEL (in stock).

Upholstered wicker chair, cushion, detachable clips, 26 x 2 1/2 in. tyre. A strong and reliable sidecar at a popular price, stocked to fit all motor cycles.

Price £5 15s.

### MILLFORD SIDECARS (in stock).

1912 Herald, improved model ..... £6 6 0  
1912 Rigid Model, with wicker body .. £9 9 0

### THE "ALL-WEATHER" SUIT.

A Reliable Outfit at a Popular Price.

Manufactured in double texture fawn water-proof material. Coat, double breasted, wind and rain cuffs, storm collar, throat tab, ventilaed under arms, two side pockets with flaps. Leggings manufactured of the same material to match, with straps for attaching to brace buttons, spat feet. Stock sizes: Coat, length 36in., chest 40, 42, 44in. (size taken over coat) Leggings, full length 34in., length inside leg 26in. Price of suit complete £15 0

Coat only 1. 10 17 6  
Leggings only 0 7 6  
Postage 6d.

The H.S. All-rubber Goggles, including one set each of smoked and plain glasses, Price 1/9. Postage 2d.

### THE HUNT MAGNETO KNIFE. A useful little tool.

BOSCH MAGNETOS ARE THE BEST.

FILE: For smoothing down Platinum Points to secure even contact. GAP GAUGE for setting Platinum Points correctly. KNIFE: The utility of which every motorist will appreciate. Price 1/- Postage 1d.

### THE HUNT "ANTARNISH."

A non-greasy, weatherproof, and IN-VISIBLE Lacquer for applying to the plated parts of Motor Cars, Cycles, etc., and also to bare clean steel, brass, or any other metal. Price per tin, 9d. Postage 3d.

### THE HUNT "ROSCO" CYLINDER PAINT.

Keeps the engine cool, prevents overheating, produces a smooth dead black surface. Unaffected by heat or water.

Price per tin, 6d. Postage 2d.

### THE HUNT

#### Motor Cycle Box Spanners.

Containing six sizes, with tommy. English manufacture. Guaranteed.

Sizes 3 1/2, 3 3/4, 4, 4 1/2, 5, 5 1/2, 6, 6 1/2.

Price 2/6 set, postage 3d.

### SPEED INDICATORS.

All Speed Indicators fitted free.

The Cowey registers from 5 to 40 and 10-60 miles per hour. Price £4/4/0.

The Stewart registers up to 60 miles per hour, £2/15/0, ditto with Trip Recorder, £3/10/0. The Jones registers up to 60 miles per hour, £3/3/0, ditto with Trip Recorder, £4/4/0.

### "COVEROLE." For Repairing Leaky Petrol Tanks, Pipes, Unions, etc.

DIRECTIONS.

For Worn Unions.—Paint the treads and cone liberally with Coverole, screw up tightly, and give a final application to the outside.

For Cracked Pipes, etc.—Smear a piece of paper, canvas, tape, or similar material with Coverole, and wrap tightly round the pipe. Price 1/- Postage 2d.

### THE H.H. HUNT BELT PUNCH AND CUTTER.

Both the cutter and punch are easily removable for sharpening, and either can be immediately renewed at the cost of a few pence—this is an advantage not to be obtained in any other punch.

Suitable for all size belts.

Price 5/- Postage 2d.

### THE HUNT TOOL BAG.

Size 9 1/2 x 5 x 4 1/2 in.

With Pockets for Oilier Plugs and Springs.

Price 7/6. Postage 4d.

**The Scottish Trials.—**

News now came through of further smashes. The entire Quadrant team was in the wars. Cass charged a bridge before lunch and bent his frame, while Allan Hay missed a corner and rammed an iron gate.

The road continued to be very rough into Braemar, where a control enabled me to repass the leaders. For eight miles we followed the broad main road down Deeside, which was inches deep in white dust. Just outside Braemar I leapt two feet into the air over the great-grandfather of all potholes, but others which succeeded were well up to sample. At Inver Inn we turned sharp right up an

fine highway up Donside. In many cases the joy was short-lived, for we soon turned up the renowned precipice described on maps as "Allargue Brae," and known to local riders as "Cockbridge Ladder." The first section of this hill is a mile in length, and contains seven right-angle corners, all rendered arduous by loose surface and the narrowness of the road. After a brief dip a second mile of gentler climbing supervenes. That it is no phenomenal climb was shown by a Scotch girl, who flew up on her Douglas in great style, but it is sufficiently trying for tired men with hot engines at the end of a gruelling day. Here again *The Motor Cycle* representative was for some time the only press-

Holroyd: Vigorously pedalling his Motosacoche.

Creyton's Junior T.T. Humber: Excellent.

Fenn (Humber): Slow; apparently all out.

South kicked more to steady himself than to help his Rudge.

Griffith's Zenith: Good; lots in hand.

Gibson coaxed his Bradbury sidecar round the first bend by clutch-slipping, then stuck, and disappeared running and helped by pushers.

Soresby (L.M.C.) changed gear much too late and promptly stuck; was pushed off, but was running when he passed out of sight.

Morrison's Douglas: Very good indeed.

Rev. P. W. Bischoff, with Miss Beatrice Langston as passenger, accomplishing a splendid ascent of Rest and be Thankful on a 3½ h.p. Triumph sidecar with Sturmy-Archer gear. The beauties of the surroundings will be appreciated by an examination of the photograph.

almost perpendicular hill, partly covered with boulders and with a surface of loose sand inches deep. Only one in two men made clean ascents, several conking out on the bottom ratio of three-speed hubs; the swerves and plunges were ludicrous to behold. Reaching the summit, we found a much better surface than in 1910, and, the road being well marked with arrows, the 1910 fiasco, when everybody got lost and the section was cancelled, was not repeated.

**Good Going at last.**

A stiff pitch at Reinloan accounted for several more riders, and everybody was pleased when a steep drop put us on the

man and official on the hill. There was a great crowd of spectators. Owing to the dry weather, this entire section was at least 100% easier than in 1910.

**An Exclusive Record of Performances.**

The following are my notes of the performances—the only record taken, since no official car appeared until most of the men were up. Unluckily, all the photographers were lost, and no camera had reached the hill by 6 p.m. Our own man was delayed with tyres at Reinloan:

Pratt's P. and M.: Good; skidded on first bend.

Alexander's Indian: Very good; plenty in reserve.

C. T. Newsome and Sproston (Rovers): Both excellent.

McMinnies (Triumph) had to jump off on the bend, and vanished upwards, running alongside gamely. A single-speed single-cylinder is no machine for Scotch trials.

Thomson's 8 h.p. Bat and sc.: Very fast, saved from ditching by a bad skid.

Macmillan's Scott went up with convincing ease.

Alexander's Douglas made perhaps the crack ascent of the day—simply toyed with the hill. Fletcher was less at home. L.A. quite good.

## The Scottish Trials.—

## A Causeway of Rocks.

Eight miles out lay the patch of road where a car was alleged to have shed its engine bolts a few weeks before. Scorching ahead of the competitors, I found that the road was being "refaced" under a grant from the Road Board. All I can say is that if the old face was worse than the new, immediate decapitation would have been a simpler plan, for the "road" was a causeway of rocks sprinkled with sand.

I got through on my low gear in great plunges without coming off, and most of the competitors were equally fortunate, though W. Pratt fell under his machine and hurt his ankle.

Some of the competitors complained bitterly of the next 100 miles, but in reality they provided some of the best going we have had. Some sixty miles consisted of grass grown moor tracks, and either of the ruts or the hoof-track provided a soft excellent going, much more comfortable than the pot-hole main roads we have sampled. Of course the gradients were always stony, and towards Tongue there were many miles of rank bad going, deep sand or large stones right across the road.

## Wild but Beautiful Scenery.

Steering in ruts leaves small chance to gaze at scenery. It was wild and desolate till we reached the north coast; indeed, the chief attraction of this district was the absence of wrong turnings one might take. Near the coast the roads grew worse and the scenery became gorgeous—indigo mountains, ultramarine lochs, green bracken, purple heather, white road, grey scree—a veritable riot of colour embodied in the grandest shapes and masses, but to look about spelt a hair-raising wobble. Near Hope the minor gradients were all single figure and very rough, while a mistake at a bend often meant a deep drop clean into the sea.

Finally, with aching wrists, I reached the test hill, Eriboll, and romped up to the summit on quarter throttle and bottom gear. It starts like Gairnair with a bad

A Rudge rider in a peculiar attitude, accounted for by his machine side-slipping in the loose surface on one of the numerous bends.

bend; 100 yards up there is a fearful hairpin—a clean, sudden *volte face* in a very narrow road on a very stiff gradient—100 yards further up there is a second hairpin, a trifle less severe, and a third corner which is merely a sharp curve conducted the men to the checker. After getting their cards signed they retraced their steps to Hope, and then struck across to Tongue.

There was no confusion, as might be expected, with men ascending and descending simultaneously, for the whole hill is visible from any point below the third bend, and difficulties only arose when a sidecar coming up met a sidecar going down.

## Fine Sidecar Ascents.

The *Motor Cycle* representative was again the only press man on the hill, but this time the officials were present in force. Let me say at once that of many

fine ascents the climbs of Hugh Gibson and P. W. Bischoff with their respective  $3\frac{1}{2}$  h.p. sidecar outfits most deeply impressed the onlooker, and if one must choose between the two Bischoff had a shade more in hand.

Though the hill does not compare with Cockbridge Ladder, it is a fine achievement for a single-cylinder engine to bring up a sidecar, no matter how low the gear ratio may be.

## Individual Notes.

Newsome's Rover: Excellent; conking accompaniment on bends.

Steel (B.S.A.) fell at second bend; was pushed off, ran, and rounded third bend in saddle. The same applies to Soresby's L.M.C.

Edmond's Humber: Good; legged on second bend.

J. Alexander's Indian: Excellent; lots of reserve power.

South's Rudge: Good; legged on second bend.

McMinnies: Touch and go whether the engine stopped on second and third bends; achieved a clean ascent by skilful driving.

Griffith's Zenith: An easy climb.

Macmillan's Scott: Very pretty ascent.

Morrison's Douglas: Baulked by Yates's Humber, which fell just in front of him on second bend; nevertheless went up well. Yates got going again, and rode remainder of hill with ease.

W. Pratt's P. and M.: Good; kicked to steady himself on second bend.

Holroyd: Got up with pushing and pedalling.

Gibson's Bradbury sidecar swung round the second bend with its side wheel clean off the ground. It then went up slowly but surely; a grand performance. The earliness of his arrival is creditable, as the forty-nine miles from Lairg were not designed for passenger outfits.

Cuffe's Indian: Very good climb.

Vernon Taylor's Rudge: Stopped second bend, rider dismounted third bend.

Sproston's Rover and Newey's Ariel: Excellent.

Brough's low compression 6 h.p. actually attempted the climb on a  $3\frac{1}{2}$  to 1

NEGOTIATING THE DEVIL'S ELBOW (between the Spittal of Glenshee and Braemar.)

C. T. Newsome ( $3\frac{1}{2}$  h.p. three-speed Rover), the first competitor to arrive making a good ascent.

S. J. K. Thomson (8 h.p. Bat sidecar) successfully rounds the difficult bend.

Scene at the luncheon stop at Arrochar, on the shore of Loch Long.

single-gear (officially verified); he failed to pick up after the bad hairpin, but re-started and raced up the remainder.

Morrison's Bat: Excellent; rider knew the hill.

Westwood's two-speed Triumph: Very good.

Berwick's New Hudson: Kicked hard on third bend.

Begg's Rudge: Almost stuck on third bend.

Cass's Quadrant: Rider running on third bend.

Begley's Hazlewood: He ran alongside for half the hill; his spring forks are damaged (reason, a cow) and wobble so badly that it is wonderful he can corner at all.

Fenn's Humber: Rider kicked at both bad bends to steady himself.

Downie's (A.J.S.): Grand climb for a lightweight; neat and sure.

Dixon's Singer took second bend very neatly indeed: Good.

Meredith's Brádbury: Good.

Cocker's 2½ h.p. Singer: Rider took the second bend rather awkwardly, but the engine did not mind, and machine went up with the clutch squeaking a little.

F. Smith's Clyno sidecar: Splendid climb. The corner work at the second bend was perfect; at the third he skidded badly.

M. Pratt (Alldays) fell heavily at the second bend; just got round the third, being half baulked by a descending competitor.

Mundy (Macheth-Precision): Very good indeed.

Keiller (G.W.K. cyclecar): Magnificent climb; his second turn was a masterpiece.

Donaldson (New Hudson): Good climb; took the second bend well, went into a ditch at third bend, but rode cleverly out again without a spill.

North (Ariel): Slow climb in clouds of blue smoke.

Bischoff (Triumph and sc.): A certain climb. Miss Langston once more "weatherilted" in enviable style.

Miss Hind (Rex) tackled second bend at too high a speed and stopped, was pushed off and stopped at third bend; Donaldson who was descending politely helped her to restart.

Lord (Rex): Very good.

Fletcher and Alexander (Douglas): Both very good.

G. Taylor (single-gear Rudge): Ran most of the way between the bends.

G. Bell (New Hudson) came up, but had several stops.

N. W. Downie (James) had a great struggle, and finally walked up without his machine, and asked to have his card signed; the cool did his engine good, and getting a start above the third bend he managed to ride the rest.

R. Holloway (Premier): Probably the best 3½ h.p. climb; apparently on middle gear till near the top, and cut out thirty yards below each corner.

Gray (Rudge multi): Neat and easy.

Oliphant (Premier): Clean ascent; lots of power.

Alan Hill (Indian): Very good.

G. Bell (New Hudson): Slow, but clean ascent.

Creyton (Junior T.T. Humber) kicked on both hairpins.

D. Bell (A.J.S. sc.) failed at bottom on first attempt; came up well after as far as third bend, where he hit the bank: after a long delay clambered up the rest somehow; his bent forks handicapped him at the corners. He showed how useful a handle-bar controlled clutch can be on a bad hill.

Le Vack (Motosacoche) got up in stages with much "H.P.A."

Macdonald (Norton) arrived late to make a first rate climb.

White (Alldays) got up with several stops.

Whitehouse (single-gear Rover) stopped at third bend.

As I left the hill after a two hours' sojourn I met Tolfree's Bat and Douglas on the Dot sidecar coming out from Hope, and heard they both stopped on the hill.

Alan Hill (7h.p. two-speed Indian) on Allargue Brae or Cockbridge Ladder. Notice his walking stick attached to the handle-bar. Hill is lame.

Entering the garage at Pitlochry. More than one competitor carried a spare cover around his waist, as done by the rearmost rider.

Wood's G.W.K. cyclecar, Thompson's Bat sidecar, and Downie's Ariel were tremendously late, but all got up. Keiller (Rudge) stopped.

### The Worries of an Official.

The officials are having trouble with some of the competitors. Some unmannerly spirits let off fireworks at the dinner table in a first-class hotel at Granton last night. One firm have sent their men spare tyres ready mounted on wheels. Even our longsuffering judges baulk at such replacements!

The sixty-nine miles home consisted of fifty-four rough miles, and fifteen miles calculated to gladden the heart of an inveterate "blinder." Local croakers prophesied a wholesale failure of the entry on three alleged "unrideable" hills, viz., Hope Hill (150 yards of stupendous gradient), Kinloch Hill (half a mile of bad surface and severe gradient), Appegill Hill (which gave Fred Dover so much trouble on his coast ride). Local croakers usually ignore the capabilities of trained riders and well-tuned engines. I can only say that I do not know which of the many moderate climbs between Hope and Thurso are referred to. Personally, I climbed them all on the middle ratio of my Triumph with Armstrong hub, and though my long stay at the official test hill made me too late to observe the competitors, I hear that only one or two experienced any real difficulty on the concluding sections.

### Wednesday's Run Difficult.

To-day's run has been gruelling. Two hundred and eleven miles over rough roads are necessarily exhausting, but there is a marked improvement in everybody's corner work, and the men are becoming so familiarised with bad going that they have taken the bad pieces at 30 m.p.h. There was quite as bad going in the 1911 Harrogate Trials (for Tan Hill is rougher than the new road at Lairg), but the crux of the Scottish Trials is that practically every mile is rough. And yet next year the course may be more severe!

### Fourth Day, Thursday, 190 Miles.

Route: Thurso, Berriedale, Brora, Bonar Bridge, Strathpeffer, Braemore Lodge, Dundonnell Hotel, and Gairloch Hotel.

We have had our first drencher to-day. Some of us heard the rain beating down on the roofs at Thurso at one o'clock this morning, and when we, at six, looked out of our windows we could scarcely see across the road so thick was the Scotch mist. The drizzle accompanied us south, with variations. For instance, at Dundneath it was as dark as twilight. Towards Bonar Bridge the drizzle changed into a torrential downpour, and everybody was quickly soaked. We heard of no garments but oilskins that were proof against it. This lasted until lunch, when the sun came out.

The going was good from Thurso by the

inland S.E. cross cut to Latheron. The surface of the Caithness portion of the End-to-end route is proverbial for excellence, and was better than I have ever seen it before. The road has been widened and rolled. Berriedale troubled nobody; the three-speed men nearly all got up on their intermediate gears. There was no excuse for sideslip until the downpour converted the loose pieces across Aultnamain Hill into soft sludge, but we heard of no tumbles.

### A Machine on Fire.

The morning's incidents consisted of Hugh Gibson's Bradbury sidecar catching fire at the Brora check, when he restarted after filling his tanks, and of yet another accident to the unlucky A.J.S. sidecar, which collided with the well-known skew-bridge at Alness Moor. The poor passenger, who was unconscious for an hour after their first smash, is again badly cut, and the sidecar has been withdrawn. The subsequent proceedings interested me only by deputy, as I broke the high tension brush of my magneto, took the magneto to bits once in pouring rain to recover the pieces, and then took it down again in a stable to remove the water. In addition, I had to rebuild my front cover with canvas, and to mend four punctures in the back tyre, and so for the rest of the day I figured as an "also ran," and report by hearsay.

Quite a number of men were despairingly talking of retiring at lunch, until the sun came out. The remainder of the ride was quite enjoyable, though once more the stones prevented enjoyment of the truly gorgeous scenery. There are no finer views in Great Britain than can be found along the stretch from Dundonnell Inn to Kinlochewe *via* Gairloch, but rough going, added to grease, glued all eyes to the road.

### A Dangerous Bridge.

Just beyond Strathpeffer a T.T. machine was seen resting against Contin Bridge with its forks looking very drunk. It

R. A. Macmillan (Scott) at the water splash between Lairg and Hope. Observe the rocky surface.

**The Scottish Trials.**

turned out that poor Creyton had misjudged the bad corner, but escaped with a sprained wrist. There is some excuse for him, for in Scotland a solitary public house at cross roads may be granted a ten-mile limit, so that men grow apt to discount danger signs.

This particular death trap is only honoured by a red triangle, though in

George Brough, who rode a 6 h.p. single-gear twin Brough in the Scottish Trials.

England it would be guarded by a perfect forest of boards. A mile or two further on a six-cylinder limousine, lying sideways in a ditch, gave eloquent testimony to the roads. Poor Gibson has been less amusing than usual to-day; he has been gradually educating his passenger in corner work, and rumour asserts that he has been seen violently thumping his drowsy cargo when a sudden corner loomed up. But to-day his back wheel covers have given trouble, and, owing to the wobble, his back tyre rubbed against the stays until it burst. Pratt's foot is still troubling him; it turns out that crossing the "new road" at Lairg he fell over the side of the causeway, and his overalls catching on his machine, he was unable to extricate himself.

**Gruinard Hill.**

There was a great plague of midges along the lochside towards Gruinard, and at the turn of the bay the sand lay much deeper across the road than usual. Gruinard Hill proved an easy climb for nearly everybody. It consists of a short steep pitch, say 300 yards of 1 in 7 or so, with a corner at the bottom and a corner at the top. The corner at the top is very loose. (Details of the performances are appended.) Most of the men seemed to find Poolewe Hill more difficult, but there have been no difficult ascents to-day, and if it had not been for the rain we should have had quite a picnic.

Hutchinson appeared at Lairg with his Rex-Jap sidecar, which was delivered too late for the start from Edinburgh. He was missing last night, and I hear he upset on a corner near Aultnaharra, owing to his having no passenger; the front forks were broken, and his unofficial run thus comes to an untimely end. A bee flew down Fenn's collar, and as the Gairloch midges have also taken a particular fancy to him, he is very un-

happy. Hill has fixed up his broken handle-bar with a walking stick, but finds left-handed corners rather awkward, as the improvised bar fouls the tank.

**Observations on Hills (THURSDAY)**

Name of Machine and Rider.	Cairnwell.	Gruinard.

N.O.: Not observed.

**An Additional Hill.**

The competitors are anxious about a rumour that the Kenmore side of Amulree Hill is to be inserted in the Saturday's route. It is true that the hills have been unnecessarily easy, not one of them containing *gradients* steep enough to test a multi-speeded 3½ h.p.—surface and corners have constituted the only difficulty on the test hills. It would seem unfair, however, to deprive men of their gold medals if they lose time on a hill which was not in the original schedule; the riders are quite agreeable to accept an optional hill-climb, provided that everybody who fails may go into

check by a loop road. From hints I have heard the hill-climbing tests in the 1913 Scottish Trials are to be positively stupendous. Frank Smith ran off the road while he was bending down to oil, and broke a stay of his sidecar frame.

**Renewing Broken Parts.**

Some controversy has been aroused about the use of spare parts. Alan Hill, after being charged on the Devil's Elbow by a non-competitor, wired for a spare handle-bar, but the judges refused permission to fit it, and only allowed him to repair the damaged bar in running time. This apparently stern decision was doubtless inspired by the cool audacity of other competitors, whose troubles were purely due to the fault of their machines. It is said that one well-known rider was actually caught in the act of mounting an engine borrowed from a non-competitor's machine, while several men walked calmly into the Oban and Grantown hotels with new wheels in their hands. As a consequence, the judges have taken a firm line.

G. T. Gray broke his magneto H.T. brush, and was towed six miles by the judges' car. He found this so uncomfortable that he decided to attempt a repair, and as the judges had pressed a tow upon him, they decided he should not be disqualified if he finished by midnight. The mishap occurred on Aultnamain Moor at 11 a.m., and after being towed to a farmhouse where he could work out of the rain, he put things to rights, and reached Gairloch at 11 p.m.

**Fifth Day, Friday, 130½ Miles.**

Route: Gairloch, Auchnasheen, Garve, Drumadrochit, Fort Augustus, and Inverness.

Friday morning opened fine, and out of the original seventy a depleted band of fifty-three stalwarts faced the starter.

Up to the Loch Maree Hotel the scenery was perhaps the finest of all we have seen. For the next ten miles to Auchnasheen the going was atrocious. The dips in these dirt roads often sink through the foundation, and then a canny Scot comes along and builds a cairn of stones over the place, and we ride over them and fall off.

The stretch from Loch Maree to Kinlochewe included some very perilous corners, some quagmire patches, and a long steep climb, on which many engines conked out last year. To-day there was no wind, and we all got up easily. There are so many variably-gearred hubs in the trial that we now describe hills in terms of those hubs. On these lines all the climbs before lunch were "middle gear hills."

After Auchnasheen we got some fine going into Garve, through rather deserted regions.

**A Terrific Thunderstorm.**

After Garve the roads were good through Muir of Ord and Beauly into Glen Urquhart, where a terrific thunderstorm burst right overhead, and in half a minute the roads were awash with water. Lightning seemed narrowly to miss one or two riders, and the down-pour was tropical in its intensity. Belt troubles followed instantaneously. One or two men, notably McMinnies and South, had started the trials with belt shields. Others had improvised guards

### The Scottish Trials.—

during yesterday's rain; Brough, for instance, had a huge sheet of lino surrounding his crank case. But the remainder were popping along at 10 or 12 m.p.h. on their bottom gears, and engines roared if the throttle was timidly opened.

The drivers of belt-driven sidecars had to dismount and run up perfectly contemptible hills.

### Jury Rigs.

Gibson appeared with Cocker in his sidecar, the latter's frame having collapsed near Invermoriston. Gibson has surmounted his cone troubles, but the puncture fiend visited him on seven occasions before lunch. Frank Smith's Clyno runs as rigidly as ever, the broken lug being safeguarded by a broomstick, straps, and lashings of cord.

The first arrivals at Fort Augustus enjoyed some little excitement, for there was no checker, no petrol, no oil, and lunch had not been ordered. However, a car presently rushed up, and everything was put to rights. As the day's run was very short (150 miles), and Fort Augustus is a most charming place, the judges granted us two hours for lunch.

The first person we met was W. B. Little, of whom we knew nothing except that he had retired near Oban on Monday. He was limping and bandaged. The back tyre of his Premier burst when he was travelling at 45 m.p.h. A wire arrived from Le Vack announcing that he had retired uninjured yesterday. He has sustained many minor troubles, and could not coax his lightweight up the hills.

### Ascent of Glendoe.

Three-quarters of a mile from the hotel begins the ascent of Glendoe. It commences with about a mile and a half of gradient, in short steps of 1 in 5, 1 in 6, and 1 in 7, separated by brief "landings" of 1 in 12 or 20. The surface is good, and the corners are negligible. In past trials it has proved rather formidable, but to-day there is nothing which can stop an alert man on a three-speeder. Practically all the survivors

made clean ascents, though a good number had nothing up their sleeves. Some of the men drove very badly; they allowed themselves to be deceived into the belief that the "landings" were level, and so they repeatedly changed up from first to second gear, and hastily changed down again when the engine knocked loudly.

The following are notes of individual performances:

Newsome (Rover): Fast, bottom gear.  
Pratt (P. and M.): Good, low gear.  
Holroyd (Motosacoche): Pedalled.  
Yates (Humber): Very good.  
Edmond (Humber): Not quite as fast.  
J. Alexander (Indian): Excellent.  
J. Steel (B.S.A.): Excellent.  
McMinnies (Triumph): Excellent.  
Griffiths (Zenith): Perhaps the fastest ascent.  
Sproston (Rover): Excellent.  
Morrison (Douglas): Phenomenal speed.  
Alexander (Douglas): Faster still.  
Westwood (Triumph): Stopped first ascent. Second climb good.  
Brough (Brough): On  $3\frac{1}{2}$  to 1 single-gear; a terrific ascent.  
Taylor and South (Rudge multis): Excellent.  
Frank Smith (Clyno sc.): Very good, (His ratios are  $4\frac{1}{2}$ , 8, and 14.)  
Fletcher (Douglas): Fair.  
Soresby (L.M.C.): Rather slow.  
Berwick (New Hudson): Very good.  
Macmillan (Scott) made a lovely climb.  
Thomson (Bat sc.): Went up easily.  
Cass (Quadrant): Very good.  
Morrison (Bat): Excellent.  
Newey and North (Ariels): Excellent; Newey halfway on middle gear.  
Keiller (G.W.K.): At a good speed.  
Wood's sister machine was equally fast.  
Bischoff (Triumph sc.), G. Taylor (Rudge), and Donaldson (New Hudson) arrived in a clump. Bischoff, clean ascent on bottom gear. Donaldson barely outstripped the sidecar; while Taylor's single gear took itself up.  
Fenn (Humber) ran alongside for a considerable distance.  
Pratt (Alldays): Very good.  
Holloway (Premier): Excellent.  
White (Alldays): Rather slow.

Meredith (Bradbury) and Dixon (Singer): Excellent.

Oliphant (Premier): Good.

### Another Severe Hill.

At this point I moved on to observe a renowned hill a mile further on, and when my own  $3\frac{1}{2}$  h.p. Triumph knocked to a standstill on a  $6\frac{1}{2}$  to 1 gear I knew I had missed some fun. This topmost hill is a continuation of Glendoe. There is a long drop after the first climb, ending in a sharp turn over a bridge. From this bridge there is a short steep pitch of, say, 1 in 6, followed by a few yards of 1 in 15, and then without any warning there comes a terrific S bend. The grade on the first corner is 1 in  $3\frac{1}{2}$  (official survey), and the second corner comes within twenty yards of the first.

The following made clean ascents: Both the G.W.K.'s, all three Premier machines, Newsome's Rover, Newey and North on Ariels, Downie's  $2\frac{1}{2}$  h.p. A.J.S., Miss Hind and R. Lord on Rex twins, Alexander's Douglas, Smith's Clyno, Mundy on the Marbeth, Meredith's Bradbury, Alan Hill's Indian, and Pratt's P. and M. All the rest failed, and a good number of them failed twice. I should add that Keiller's G.W.K. stopped through a mulled gear change, but that he adroitly restarted on the steepest patch.

This surprise tit-bit concluded the day's fiercer joys, and a peaceful run of thirty-three miles into Inverness was a pleasant conclusion. The going was excellent, but some lazy spirits noticed that the route-layer had failed to safeguard a short cut by a check, and so saved themselves seven or eight miles.

A meeting of the competitors is to be held this evening, at which the judges will probably announce:

(a) That several extra special prizes are to be awarded.

(b) That nobody need expect—unless he climbs Amulree from the Kenmore side.

(c) That riders may select the easiest route if preferred.

(d) That anybody who starts up Amulree must get up somehow.

Waiting outside the Fort Augustus check.

W. Pratt (P. & M.) and C. T. Newsome ( $3\frac{1}{2}$  h.p. Rover) in the pouring rain on Friday.

## The Scottish Trials.—

In response to these suggestions, the riders took a vote, and, as a majority were in favour of climbing Kenmore, the entire trial will go that way.

For list of marks lost in to-day's run see table at end of report.

## Last Day, Saturday, 178½ Miles.

Route: Inverness, Kingussie, across the Grampians, Pitlochry, Aberfeldy, up Kenmore side of Amulree, Crieff, Stirling, and Edinburgh.

The withdrawal of Macdonald and Cocker (see table) left thirty men still in possession of clean sheets, and there was an atmosphere of bated breath about the start, in view of the inserted climb at Amulree, perforce accepted by the competitors in view of the officials' firm stand at the meeting on Friday night.

J. Donaldson (3½ h.p. New Hudson) overslept himself, and though the official start was timed for 8 a.m., he did not wake till a few minutes before nine. He scrambled into his clothes, rushed to the garage, flattened his nose down on to the lamp bracket, and raced over the mountains. Having no watch or speedometer he was quite ignorant how he stood, but he reached the check at Kingussie, forty-five miles away, with a few seconds in hand.

## Over the Grampians.

The other men purred peacefully over the summit, for the Grampian road is now a first-class highway, broad and smooth.

Pot-holes of great depth, indented at frequent intervals, spoilt the last few miles into Pitlochry, where we lunched at Scotland's Hotel.

We had scarcely got away from Pitlochry before another Highland thunderstorm burst upon us. I ran out past Aberfeldy to inspect the Kenmore Hill before the men got there, and went straight up non-stop with a hot engine, without even having to trail my feet on the bends. This test run made it evident that the ascent would not cost any solo machine a gold medal. It is impossible either to "observe" or describe so long and tortuous a hill. It commences with single figure gradient, rising clean out of the Aberfeldy-Killin Road at an angle of thirty degrees or so, and a good rush can be snatched off the bridge. The road is very narrow and stony, with here and there great slabs of rock jutting out of the track. There are at least eight corners which necessitate slowing right down, and at least two of them are genuinely difficult, but there is no terrific combination of corner and gradient at any given point.

The sidecars and cyclecars were started last this morning, lest they should stick on the hill, and baulk the bicycles. The following appeared to make absolutely clean ascents: Newsome (Rover), Pratt (P. and M.), Alexander (Indian), Macmillan (Scott), Fletcher (Douglas), Meredith (Bradbury), Holloway (Premier), A. U. R. Downie (A.J.S.), and Miss Hind (Rex).

I may add that all three official cars (modern vehicles of good horse-power) stuck on the hill.

The following made good ascents, although not actually clean climbs: Holroyd (Motosacoche), Griffiths (Zenith), Cass (Quadrant), Alexander (Indian),

Brough, Alexander (Douglas), Downie (A.J.S.), R. Lord (Rex), F. Smith (Clyno), and Keiller (G.W.K. cyclecar).

Rain fell in sheets for most of the fifty-five miles which separated us from Edinburgh, and belt-slip hindered most of us. The back cover of Alan Hill's 7 h.p. Indian burst thirty miles from home—a sickening *contrecleps* with a gold medal almost in one's grasp. We saw him under the trees with his back wheel out, assisted by passing motor cyclists, and we thought his medal was doomed, but a little later as we trickled through a ten-mile limit he roared past at terrific speed, and he just got in to time, amidst general congratulations.

The crowd at the finish was as large as ever, in spite of the mud and rain. The flooded roads gave us one piece of information. We thought the gigantic pot-holes for which most of the Scotch main roads are remarkable were ascribable either to carelessness or to parsimony, but we saw to-day that they serve one very useful purpose. We passed through one village where there was a deep pot-hole full of water to each square yard of road and a duck in almost every pot-hole!

BASIL H. DAVIES.

## Special Awards.

PRIVATE OWNERS' PRIZE (*The Manufacturers' Union Trophy*), value £10 10s.

R. A. Macmillan (3½ h.p. Scott).

TRADE RIDERS' PRIZE:

W. Pratt (3½ h.p. P. and M.).

PASSENGER MACHINE PRIZE:

C. M. Keiller (8 h.p. G.W.K. cyclecar).

LIGHTWEIGHT PRIZE:

A. U. R. Downie (2½ h.p. A.J.S.).

TEAM PRIZE:

The Indian Team (J. R. Alexander, B. A. Hill, and G. E. Cuffe, 7 h.p. Indians).

## TABLE OF AWARDS AND MARKS LOST.

RIDER AND MACHINE.	Mon.	Tues.	Wed.	Thurs.	Fri.	Sat.	TOTAL.	REMARKS.
R. A. Macmillan (3½ Scott)	0	0	0	0	0	0	0	Gold medal
J. S. Holroyd (2½ Motosacoche)	0	0	0	0	0	0	0	Gold medal

F. S. Douglas (3 Dot)	18	60	60	Rtd.				General troubles

# Sheffield Club's Open Hill-climb.

THE Sheffield and Hallamshire Motor Cycle Club's open hill-climb was held on Saturday last on a hill near Chesterfield, locally known as Slack Hill. This hill, sometimes called Amber Hill, is on the main Chesterfield-Matlock Road. It is a long pull of nearly a mile, commencing with a straight gradual rise, then a bend

General view of the start, looking towards the summit of Slack Hill.

to the right on a gradient of about 1 in 6—the steepest part—followed by a more severe twist to the left, and culminating in about a quarter of a mile of 1 in 10. The surface is more gritty than in the case of the average Derbyshire hill, consequently the road was not greasy, despite the heavy rain.

The weather did not favour the organising club, for shortly before the advertised time of starting a violent thunderstorm broke over the district. So violent was it that when we passed through Chesterfield the water was pouring through the lower rooms of a row of houses, the frightened occupants retreating with articles of furniture.

The road from Sheffield via Chesterfield was completely cut off by a swollen river. At the top of the hill a car containing several officials, and belonging to the president of the Sheffield Club, Mr. Bisby, was struck by a flash of lightning, and some of the paint and metalwork damaged; the occupants, however, escaped injury.

## CLASS 1.—Lightweights up to 350 c.c.

In Class 1, E. Woods (2½ Levis) made a very good ascent. H. C. Newman (Ivy) made a very fast climb, as also did J. Dudley on a 2½ Hobart-Precision. Mrs. Carter, the only lady competitor, failed at the corner. Result:

	M. S.	Fig. of merit.
S. Philpott (2 Humber) ...	1 56 <sup>3</sup> / <sub>5</sub>	83.3
H. C. Newman (2½ Ivy) ...	1 17 <sup>4</sup> / <sub>5</sub>	90.2
J. Dudley (2½ Hobart-Precision) ...	1 28 <sup>4</sup> / <sub>5</sub>	103.4

## CLASS 2.—Lightweights up to 350 c.c.

J. Haslam on his T.T. Douglas rode well, especially at the corner, whilst Dan Bradbury on an overhead valve New Hudson would no doubt have made fastest time had it not been for misfiring when in sight of the finishing banner, the magneto terminal having come loose. R. N. Corah on a small red twin also made good time. Result:

D. Bradbury (2½ New Hudson) ...	1 30	73.4
J. Haslam (2½ Douglas) ...	1 12 <sup>3</sup> / <sub>5</sub>	84.7
H. Petty (2½ Singer) ...	1 36 <sup>1</sup> / <sub>5</sub>	86.1

## CLASS 3.—Standard singles up to 560 c.c.

H. C. Newman again made the fastest climb in this class, coming well round the corner. R. Flint (Norton) also rode steadily and well. Dan Bradbury on his Norton made a good climb. Result:

	M. S.	Fig. of merit.
D. Bradbury (Norton) ...	1 9 <sup>1</sup> / <sub>5</sub>	88.9
H. C. Newman (Ivy) ...	1 23 <sup>3</sup> / <sub>5</sub>	98.5
S. Sawyer (Premier) ...	1 11 <sup>5</sup> / <sub>5</sub>	98.7

## CLASS 4.—T.T. singles up to 500 c.c.

This was the best supported event. Especially good climbs were made by H. Eardley and F. Dover (Premiers), R. Flint (Norton), E. L. Moxley (B.S.A.), and W. F. Newsome (Triumph), but all those mentioned were overshadowed by H. C. Newman (Ivy-Precision). Newman was apparently geared higher than usual, but he shot up the 1 in 6 section like a rocket. S. Crawley (Triumph) exhibited more dash than Newsome at the bends, but as he had to switch off several times we doubt if he saved a second thereby.

D. Bradbury (Norton) ...	1 8	87.4
E. L. Moxley (B.S.A.) ...	1 24	90.8
H. C. Newman (Ivy) ...	1 30 <sup>1</sup> / <sub>5</sub>	99.8
K. Clark (Corah) ...	1 31 <sup>1</sup> / <sub>5</sub>	100.1
H. Eardley (Premier) ...	1 50 <sup>1</sup> / <sub>5</sub>	100.9
G. S. Hall (Scale-Jap) ...	1 30	101.1
FASTEST TIME: R. Flint (Norton) ...	1 20 <sup>1</sup> / <sub>5</sub>	103.2

## CLASS 5.—Standard multi-cylinders up to 1,100 c.c.

This event was rather disappointing, the big twins not making much better time than the singles, although A. B. Wade (6 h.p. Zenith) rode splendidly. Jack Haslam, on a similar mount, appeared to wobble slightly at the corner, but recovered himself.

A. B. Wade (6 Zenith) ...	0 59	117.4
Jack Haslam (6 Zenith) ...	1 54	127.6
T. Roper (7 Indian) ...	1 9 <sup>5</sup> / <sub>5</sub>	162.4

The twins, with the exception of Wade's Zenith, which made fastest time of the day in this event, were again slow. Result:

A. B. Wade (6 Zenith) ...	0 58	115.3
Jack Haslam (6 Zenith) ...	1 5	126
R. Garnett (6 Matchless) ...	1 12 <sup>3</sup> / <sub>5</sub>	132.4

## CLASS 7.—Sidecars and cyclecars.

This was carried out in the pouring rain, the competitors having the course to themselves, all the spectators having scrambled to shelter. A. B. Wade made a third exceedingly fine ascent, but the best performance was undoubtedly that of H. C. Newman, whose 3½ h.p. Ivy brought the rider and sidecar up at a wonderful speed, the passenger being obliged to lean over on the bends to keep the wheel down.

The Gordon cyclecar started well, but commenced misfiring at the corner, and did not finish the climb. Result:

H. C. Newman (3½ Ivy) ...	1 30 <sup>5</sup> / <sub>5</sub>	89.3
A. B. Wade (6 Zenith) ...	1 19	93.8
Jack Haslam (6 Zenith) ...	1 34 <sup>4</sup> / <sub>5</sub>	100.2
H. P. Jeffries (6 Zenith) ...	1 45	120

The general arrangements were very good, the only delays being occasioned by a small amount of traffic on the hill, but a telephone installation prevented any possibility of collisions.

K. Clark (3½ h.p. Corah-Jap) negotiating the second bend on Slack Hill.

# ENGLISH-DUTCH RELIABILITY TRIAL.

FINAL ARRANGEMENTS FOR THE INTERNATIONAL TRIAL ON AUGUST 5th.

THE arrangements for the above trial are now complete. On Saturday next, the majority of the British riders will leave Liverpool Street, London, by the 4.10 p.m. boat train, and will be met by the remainder of the party at Parkeston Quay, Harwich. Every competitor must report himself to the captains, Messrs. Cooper and Pratt, by 6 p.m. The boat leaves for the Hook of Holland at 10 p.m., and is due at 5.15 a.m. The hon. secretary of the Dutch Motor Cycle Club and members of the council will be in waiting to welcome the English competitors.

Number-plates and the complete regulations have been issued to all competitors.

The final selection of the British team is as follows:

## PRIVATE OWNERS.

Class A.—For machines up to 350 c.c.

No. E2. Geoffrey Smith (2½ h.p. Humber).

E8. C. Maurice Down (2½ h.p. Enfield).

E34. F. C. Wasley (2½ h.p. Douglas).

Reserves: F. A. Hardy (Norton) and J. C. Bennett-Mitchell (2½ h.p. Douglas).

Class B.—For machines from 350 to 500 c.c.

E22. Vernon Taylor (3½ h.p. Rudge).

E28. Fred Dover (3½ h.p. Premier).

E36. E. Lester (3½ h.p. P. and M.).

Reserve: Seymour Smith (3½ h.p. Norton).

Class C.—For machines from 500 to 1,000 c.c.

E24. W. Cooper (3½ h.p. Bradbury).

E30. C. W. Wilson (Morgan Runabout).

E14. A. E. Uffleman (6 h.p. Rex-Jap).

Reserve: W. O. Oldman (Bat).

## TRADE TEAM.

Class A.—For machines up to 350

E4. W. W. Douglas (2½ h.p. Douglas).

E10. R. Holloway (2½ h.p. Premier).

E16. Sam Wright (2½ h.p. Humber).

Reserve: H. Graham Dixon (2½ h.p. New Hudson).

Class B.—For machines from 350 to 500 c.c.

E20. W. F. Newsome (3½ h.p. Triumph).

E26. W. Pratt (3½ h.p. P. and M.).

E32. J. H. Slaughter (3½ h.p. New Hudson).

Reserve: F. C. North (3½ h.p. Ariel).

Class C.—For machines from 500 to 1,000 c.c.)

E6. Frank Smith (5-6 h.p. Clyno sc.)

E12. F. W. Barnes (6 h.p. Zenith sc.)

E18. F. A. Applebee (3½ h.p. Scott sc.)

Reserve: R. Lord (6 h.p. Rex Sidette).

Tuesday will be spent at Volendam, and the evening at Amsterdam. On Wednesday the English party return home after visiting Haarlem, Lisse, Ouden Deyll, and the Hague. The boat leaves the Hook at 11.50 p.m., but the G.E.R. advise the whole party to be at the Hook not later than 8 p.m.

## Preliminary Stages of A.C.U. Silencer Trials.

AS announced in these pages, the preliminary portion of the silencer trial was devoted to establishing a standard of silence to which the silencers ultimately entered will be required to attain. Thanks to the courtesy of Messrs. Auto Carriers, Ltd., Ferry Works, Thames Ditton, their splendidly equipped factory was placed at the disposal of the Union, and the principals of the firm, Messrs. John Weller, J. Portwine, and H. Carr, together with their foreman, rendered valuable assistance.

In addition, those present were: Col. H. C. L. Holden, F.R.S., R.A., C.B., Messrs. A. M. Low, A. Sharp, J. W. G. Brooker, V. Hart, E. M. P. Boileau, the Secretary and the Assistant Secretary representing the Auto Cycle Union, while Mr. John V. Pugh (Rudge-Whitworth, Ltd.), and Messrs. F. Hulbert and C. Hathaway (Triumph Cycle Co.) represented the trade.

### The Experimental Silencer.

As previously mentioned in *The Motor Cycle*, the experimental silencers consisted of a cylinder 5in. diameter by 12in. long, into which a slightly smaller tube was telescoped and rendered adjustable. The inner tube had an outlet about 1¼in. in diameter. These experimental silencers were fitted to a Triumph and a Rudge, placed at the disposal of the A.C.U. by their manufacturers.

Mr. H. P. Beasley, under the direction of Col. Holden, rode the machines in turn. First the silencer was used with the inner tube shut right in, then half extended, and then fully extended, each time at varying speeds. The best results as regards quietness were obtained with the tube half extended, while full extension resulted in rendering the sound peculiarly metallic.

The committee were not satisfied with the results obtained, and so a 1in. pipe 9in. long was fitted to the outlet of the experimental silencer.

The results were then adjudged to be satisfactory, and it was finally determined that a silencer which would give the correct standard of quietness should be made up of a size 5in. diameter by 12in. long, with an outlet pipe 10in. long and 5⁄8in. bore. The original 1in. outlet was found to be too large, and so a 5⁄8in. tube was fitted inside it. The Triumph was fitted with an extra small exhaust pipe to fit the experimental silencer. The Rudge exhaust pipe was of standard size. The dimensions of the final silencer will be sent to all intending entrants, so that they may know the requisite degree of quietness.

The experimental silencer fitted to a Triumph It is shown extended.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Aug. 1st	...	8.48 p.m.
" 3rd	...	8.44 "
" 5th	...	8.41 "
" 7th	...	8.37 "

## Next Monday's Brooklands Meeting.

S. L. Bailey will compete at Brooklands on Monday next on a 2½ h.p. Douglas. His name was omitted from the official list of entrants published on page 856.

## Three-speed Gears for 1913.

The Sturmey Archer Gear Co. are bringing out a slightly enlarged pattern of the S.A. three-speed hub gear suitable for powerful machines, particularly when used with a sidecar. We understand that there will be practically no alteration to the gear, but the hub barrel will be larger in diameter, and the width over the cones increased.

## Through Floods on a Sidecar.

An exciting experience befell the writer last Saturday whilst driving a Singer sidecar on the way to the Sheffield Club's open hill-climb. During lunch at Bakewell there was a cloud burst in the Peak District, water running down the hillsides and quickly flooding road and railway track. After the storm, a start was made for Slack, the scene of the hill-climb, but near Haddon Hall we were confronted by a sheet of water a yard deep which held up a number of cars and excursion parties. As progress this way was impossible, a return had to be made to Bakewell and another outlet attempted via Chesterfield Road until the turning to Edensor and Chatsworth was reached. Passing through several water splashes, a further sheet of water, about six to eight inches deep, was encountered at Edensor, and it extended for several hundred yards into Chatsworth Park. This successfully negotiated, a mile or two further on the deepest water splash of the lot barred entry to Rowsley village. The water was quite a foot deep in the roadway and six inches on the footpath. By riding the sidecar at a great angle with the bicycle wheels on the pathway and the sidecar wheel in the road with water above the axle, Rowsley was eventually reached, and the journey continued without further incident. Luckily it so happened that the machine we were riding—a 4 h.p. two-speed Singer—was the most suitable motor cycle possible. The high magneto position was ideal, for the machine never misfired, and it is further testimony to the big counter-shaft driving pulley when we state that, on the level at any rate, the Dunlop rubber belt would grip with the pulleys submerged in water.

## Midland Reliability Trial.

The South Birmingham M.C.C. trial over a 109 miles course, including Farlow Bank and Ankerdine Hill, was decided last week-end. Only three competitors climbed Farlow, and this decided the result, which was: 1 (dead-heat), J. J. Woodgate (2½ h.p. Singer) and S. A. Rowlandson (3½ h.p. Rudge multi); 3, S. K. Jones (3½ h.p. L.M.C.).

## AUGUST BANK HOLIDAY.

Owing to the above Holiday, the issue of "The Motor Cycle" for August 8th will be closed for press earlier than usual. All copy and instructions for paragraph advertisements in this issue must therefore be in our hands not later than first post on Thursday, August 1st.

## Pedestrians' Rights in Austria.

The Vienna police, being of the opinion that pedestrians are chiefly to blame for street accidents, have issued a notice to the effect that a pedestrian, if he wish to cross the road, must do so in a direct line, taking the shortest path. Persons found walking along the street lengthwise and thus endangering their own safety and that of others will be reprimanded by the police, and in the case of their not complying with such directions will be subject to fines varying from 1s. 6d. to £8. We can imagine the clamour that the mere proposal to institute such a regulation in this country would create.

## SPECIAL FEATURES.

THE SCOTTISH TRIALS  
Complete Report and Tabulated List of Awards.

R.A.C. AND ASSOCIATED CLUBS'  
GALA DAY.

SHEFFIELD OPEN HILL-CLIMB.

## Hill-climbing.

A. G. Cox, 89, Gladstone Road, Smethley, Birmingham, informs us that recently made an ascent of Great Orme Head, Llandudno, on a 2½ h.p. Bala Levis geared 6½ to 1.

## Behaviour on the Scottish Trials.

We regret to report that the behaviour of a certain section of the competitors at certain hotels left much to be desired. The riders stayed in every instance in first-class hotels. Some of them off fireworks during the hotel dinner one town, and at another they wrecked the largest smoking room, which looked next morning as though it had been bombarded, while they made a great uproar until well on in the small hours disturbing the regular guests.

We may say two things about such conduct. It is a pity to create an impression that motor cyclists as a class are bounders, and it is a pity to complicate the already very difficult task of arranging hotel accommodation. The suggestion of a rule that a repetition of such conduct would entail disqualification appears to be the best remedy for such absurd manners.

THE SCOTTISH TRIALS. Climbing Wednesday's test hill in a cloud of smoke. (3½ h.p. Scott, winner of the private owners' class.

R. A. Macmillan.

**A.C.U. Six Days' Trials.**

Entries at ordinary fees for the above trial closed on the 29th ult. Late entries will be accepted at double fees up to Saturday next.

**3½ h.p. ties with an 8 h.p. Machine.**

A particularly good performance at the Newton Coldfield A.C. hill-climb was that of K. Clark riding a 3½ h.p. Corah-Jap. His rider tied with F. Shakespeare on an 8 h.p. Rex-Jap for fastest time of the year.

**Mont Ventoux Meeting.**

It is interesting to note, in connection with the above meeting, which will be held on August 10th and 11th, that the record for the hill-climb is held by Amberjack on a twin Griffon motor cycle—25m. 40s. Will anybody beat his time on an up-to-date mount?

**Good Climb.**

Lynton Hill, Lynmouth, one of the test hills in the A.C.U. Six Days Trials, was climbed on a single-gear light weight last Thursday. Herbert Bunce, of Atherhan, was the rider, his mount being a 2½ h.p. Premier. He tells us that the machine negotiated both hairpin bends without pedal assistance.

**Observers in the Six Days' Trials.**

Motor cyclist observers are urgently required for the Six Days' Trials. Many riders could well spend an enjoyable time in the beautiful West Country, see the most interesting phases of the trial, which will probably be the biggest the A.C.U. has ever held, and at the same time under the governing body valuable assistance. Those who feel disposed thus to under the Union a service should communicate at once with the secretary, Mr. W. Loughborough, 89, Pall Mall, S.W.

**Auto Cycle Union Notes.**

**THE F.I.C.M.**—As has been previously mentioned in these pages, the Auto Cycle Union is exerting every effort to establish the International Federation of Motor Cyclists. Mr. T. W. Loughborough, the secretary of the A.C.U., informs us that he recently had a visit from Mr. G. Sweerts, a representative of the French paper *L'Aero*, and this journal will use its influence with the clubs in France, Belgium, and Germany. Mr. W. H. Wells is now on a visit to America, and has promised to interview the Federation of American Motor Cyclists on the subject, while the A.C.U. itself is in communication with the leading clubs of other countries. It has been suggested that as soon as the Federation has been formed a meeting should be held in London. This will probably be during show week.

**TYRE TESTS IN THE SIX DAYS'.**—It was mentioned recently in *The Motor Cycle* that the tyre section of the Manufacturers' Union had resolved not to enter their tyres in the six days' trials. This resolution has now been rescinded. A meeting was held at the Holborn restaurant last week, at which several tyre manufacturers expressed their desire to enter despite the resolution. Up to the present the A.C.U. has received entries from the Palmer Tyre, Ltd.—one of Palmer tyres, 25in. x 3in., which will be used by R. C. Davis. Five Rom

**FUTURE EVENTS**

- Aug. 2.—Bristol B.&M.C. Open 24 Hours' Trial to Land's End and back  
 3.—Cumberland C.M.C.C. Open Speed Trials.  
 3.—Mersey M.C. Open Hill-climb on Pen-y-Ball, Flintshire.  
 3 5.—M.C.C. Reliability and Brake Testing Trial in Devonshire.  
 12-17.—A.C.U. Six Days' Trials.  
 31.—Coventry and Warwickshire M.C. Annual Open Hill-climb.

tyres (Rom Tyre and Rubber Co.) have also been entered, consisting of 26in. x 2½in. tyres for the front wheels, and 26in. x 2½in. tyres for the rear wheels, which fit 2½in. rims. The Stellastic Tyre Co., 76, York Street, Westminster, S.W., who are bringing out a new tyre in which steel wire is interwoven in the tread, have entered twelve tyres. J. Pedley and Son, Ltd., have entered Pedley tyres and belts, and the Wood-Milne Co. and Leicester Rubber Co. are expected to enter their tyres. The Service Co. have also entered three belts.

**SIX DAYS' TRIALS ARRANGEMENTS.**—It has been arranged to store the machines in the Drill Hall, Taunton, and as the hall has had to be hired competitors will be asked to pay the nominal fee of 6d. per night for the accommodation. Machines will be on view to the public in the Drill Hall on Monday, Tuesday, and Friday, August 12th, 13th, and 16th, from 8 to 10 p.m., and on Wednesday and Thursday, August 14th and 15th, from 9 to 10 p.m., admission 1s. The aid of 150 boy scouts has been invoked to mark the course, and all the R.A.C. guides in the West of England will render their assistance.

**Oxford M.C.C. Open Speed Trials.**

The open speed trials promoted by the Oxford M.C.C., which were to have been held on Saturday last at Heythrop Park, near Chipping Norton, were cancelled at the last moment owing to lack of trade entries.

**Unsuitable Lamps**

At a coroner's inquest held at Bromley (Kent) on D. H. Foote, a member of the Putney M.C., who unfortunately met with his death through colliding with the rear of a market cart at Bromley early in the morning, the evidence showed that he was using an ordinary pedal cycle lamp. There was no rear lamp on the cart, but the side lamp had a small red glass at the back. Deceased and two other members of the club had been unable to obtain overnight accommodation at an hotel on the Westerham road, and were riding to Bromley.

**Two-wheeled Sidecars and Taxation.**

An interesting case to owners of Lowen sidecars was heard at the Bury Court on Thursday last, when W. T. Booth, Bury, was summoned in three cases for driving an unregistered motor car, having no identification plate on same and no rear light. The evidence proved that the defendant was using a two-wheeled sidecar, and the ruling of the Court was that as it had four wheels it ought to have been registered as a motor car, and should have complied with the motor car regulations. The defendant's legal representative asked the magistrate's Clerk if he would call a motor cycle and trailer a motor car? The witness replied, "No, sir." He was then asked if he did not say that a motor vehicle with four wheels was a motor car, and his reply was, "Not exactly." The Court ruled that the particular sidecar and motor bicycle was a motor car within the meaning of the Act, and that the defendant must, in future, carry a rear light and pay the car licence fee. Defendant was ordered to pay the costs of the three cases.

**SHEFFIELD OPEN HILL CLIMB.**  
 W. F. Newsome (3½ h.p. Triumph) on the first bend. The gradient is steepest at this point.

# CLUB NEWS

## Western District M.C. (London).

A large number of members visited Brooklands on Saturday last, and much enjoyed the programme provided.

## Goulburn (N.S.W.) M.C.

At a meeting of the club held on the 14th June, Mr. W. G. Thompson gave an interesting lecture on the magneto, describing the construction in detail. A two days' run will shortly take place to Chatsbury.

## Walthamstow M.C.

The two hundred mile standard reliability trial held on the 21st ult. to Norwich and back resulted as follows: 1, A. T. Peppercorn ( $3\frac{1}{2}$  Bradbury), silver cup; 2, W. Wilson ( $2\frac{1}{2}$  S.I.A.M.T.), silver cup; 3, T. Danaker ( $3\frac{1}{2}$  Humber), silver cup.

## Nottingham and District M.C.C.

There will be a reliability run on the 5th inst. to Bowes and back for a cup presented by Humber, Ltd. A club hill-climb will be held on the 17th inst., and a passenger machine trial on the 31st inst. for a silver cup presented by the New Hudson Cycle Co.

## Luton and South Beds. M.C.C.

On the 27th ult. a paperchase was run off, starting from Luton and finishing at the Bridgwater Arms, Little Gaddesden. F. Mussell (Rex sc.) and Deacon (Rudge), the hares (twenty minutes' start), successfully eluded the hounds, numbering about twenty. Gutteridge (Rudge) was the first man in, about ten minutes after the hares. After tea an impromptu speed-judging and speed trial was run off, with the result that Gutteridge was first, Karslake second, and Jarvis third.

## Willesden Green C. and M.C.C.

A speed-judging and reliability trial was held on the 20th ult. to Bicester and back. Out of seventeen starters fifteen finished. Result: 1, J. W. Buhner ( $2\frac{3}{4}$  h.p. Douglas), lost 9 marks; 2, C. W. Sufford ( $3\frac{1}{2}$  h.p. Humber and sc.), lost 10 marks; 3, F. W. Lemming (5-6 h.p. F.N.), lost 11 marks.

The club has made arrangements for a clubhouse in Willesden Green. Hon. sec., Mr. J. C. Ball, 166, Chapter Road, Willesden Green, N.W.

The three winners in the Birmingham M.C.C. speed-judging competition. W. H. Egginton ( $3\frac{1}{2}$  h.p. New Hudson sidecar), Seymour Smith ( $3\frac{1}{2}$  h.p. Norton), and S. K. Jones ( $3\frac{1}{2}$  h.p. L.M.C.) outside the Swan's Nest, Stratford-on-Avon.

## Goole M.C.C.

This newly formed club has a membership of twenty-five. A run to Blackpool will take place shortly. The hon. sec. is Mr. T. Huntingdon, Onsedene, Goole.

## Mersey M.C.

The date for receiving entries for the open hill-climb on August 3rd has been extended to noon on August 2nd. Late entries at double fees will be accepted on the morning of the race.

## Finsbury Park C.C. (Motor Cycle Section).

The President's Challenge Cup will be competed for in a hill-climb to take place on August Bank Holiday Monday. It has been exhibited in the window of Messrs. Humber, Ltd., 32, Holborn Viaduct, E.C. The donor of the cup is Mr. George A. Touche, M.P.

## Birmingham M.C.C.

There was a very good turnout to the speed-judging competition on Saturday, and the run to Stratford-on-Avon proved very pleasant. The start was from the King's Head Hotel, Alcester Road, at three o'clock, the riders having drawn for speeds as usual. Results: 1, Seymour Smith (Norton), with only 30s. error; 2, W. H. Egginton (New Hudson), error 1m.; 3, R. Ball (Kerry), error 1m. 4s.

## Streatham and District M.C.C.

At the general meeting held recently a special committee was formed to organise and run all social events. Special encouragement will be given to gentlemen to bring out ladies on runs, and local experts in the different districts in which members reside will be at the service of members for advice. Mr. H. J. Jeffery is secretary.

## Dublin and District M.C.C.

A hundred mile handicap was held at Portmarnock on the 27th ult., which resulted as under:

	Start.	
1. C. B. Franklin ( $3\frac{1}{2}$ Indian) ...	8m. ... 2h. 9m. 13s.	
2. W. Curtis (5 Indian) ...	13m. ... 2h. 15m. 43s.	
3. T. E. Greeve ( $3\frac{1}{2}$ Rudge) ...	13m. ... 2h. 18m. 46s.	
4. S. W. Dunkley ( $3\frac{1}{2}$ Indian) ...	13m. ... 2h. 31m. 6s.	
5. W. J. Towell ( $3\frac{1}{2}$ Rudge) ...	30m. ... 2h. 38m. 38s.	
6. J. Heag ( $3\frac{1}{2}$ Rudge) ...	22m. ... 2h. 39m. 46s.	

## Scottish Border M.C.C.

A hill-climb at Lanton Hill was held on Saturday in splendid weather. There was a good entry, and, although the hill was very rough indeed, good sport was witnessed. The times were as follows: 1, A. J. C. Lindsay ( $3\frac{1}{2}$  Rover), 57½s. fast, 4m. 34s. slow; 2, W. B. Smith ( $3\frac{1}{2}$  Bat), 81s. fast, 3m. 13½s. slow.

Knock-out Competition.—W. J. Pringle beat J. O. Halliday, N. White beat L. Purdon, T. Milligan beat J. P. Laing, A. J. C. Lindsay beat Geo. Miller, N. White beat W. J. Pringle, A. J. C. Lindsay beat T. Milligan, and Lindsay ( $3\frac{1}{2}$  Rover) beat White ( $3\frac{1}{2}$  Victoria-Precision).

Sidecar Results.—1, W. B. Smith ( $3\frac{1}{2}$  Bat and sidecar), 107s.; 2, T. Gillies ( $3\frac{1}{2}$  Bat and sidecar), 107½s.

The new timing apparatus worked splendidly, and all classes were run off smartly.

# Royal Automobile and Associated Clubs' Gala Day.

THE second annual gala day of clubs associated to the R.A.C. was held at Brooklands on Saturday last. The weather was all that could be desired, and the attendance excellent. The motor cycle events were particularly well supported, and the keenest interest was taken in them. The Auto Cycle Union is responsible for many associates to the parent body, and consequently the races in which it is most interested formed an important part of the programme. The first motor cycle event had so many entries that two heats had to be run off, the first eight in each competing in the final. The race was down in the programme as: The Motor Cycle Short Distance Handicap. For any class, of motor cycle, the cylinder capacity of which does not exceed 1,000 c.c., owned by a member or an affiliated member of the A.C.U. Starters allowed. The machines could be stripped for racing. Distance about 5½ miles, start at "fork" and finish on "the long finishing line." The machines had to pass the fork once and then enter the straight. Prizes: The winner, the cup presented by *The Motor Cycle*; the second, third, and fourth, cups. C. R. Collier broke his belt on the way to the fork and consequently could not compete. The order past the fork was as follows: Beasley, Parker, Jacobs, Hillis, Flanders, Garrett, S. R. Cooke, Southgate, Bolton, Gnest, H. G. Ayers, Nash, J. W. Ayers, and Dreydel. The race resulted in a win for Garrett, who caught Beasley just before the finishing line. Garrett's Green-Precision ran in splendid form and covered the distance at the rate of 64½ m.p.h.

S. F. Garrett (1 Green-Precision)	85×88	499	56s.
H. P. Beasley (1 Singer)...	69×80	299	2m. 22s.
R. E. Guest (2 Matchless) ...	85×64	726	34s.
R. G. Parker (2 Enfield) ...	64×54	349	2m. 10s.
W. A. Jacobs (1 Singer)...	69×80	299	1m. 56s.
D. C. Bolton (1 Rudge) ...	85×88	499	40s.
G. Flanders (1 Rudge) ...	85×88	499	1m. 16s.
J. Southgate (1 Matchless) ...	85×85	482	1m. 6s.

Second heat. V. E. Horsman broke the piston of his engine, received permission to ride the smaller of his two machines, and as he could not get the latter to start was unable to compete. Martin was riding a very pretty mount of his own make which was provided with a Rotherham pressure feed lubricator provided with a very diminutive and neat looking gauge. At the start a group of six made an impressive departure, each with 1m. 16s. start. Bailey, the Australian Douglas exponent, got away in excellent form. The first lap order was: Reed, Bailey, Mills, Fowler, Martin, Colliver, Rowden, Brunton, Lawrence, Da Silva, Le Grand, Buchanan, and Pooley. Harry Reed jumped in an easy winner, having accomplished the distance at the splendid speed of seventy-three miles an hour. Mills passed Bailey just on the finishing line:

## SECOND HEAT RESULT.

H. Reed (2 Dot) ...	90	×77.5	997	12s.
H. C. Mills (1 Regal-Precision)	85	×88	499	56s.
S. L. Bailey (2 Douglas) ...	60	×60	345	56s.
W. G. Fowler (1 Rudge) ...	85	×88	499	1m. 16s.
E. A. Colliver (1 Zenith) ...	90	×77.5	499	1m. 6s.
H. Martin (1 Martin) ...	80.5	×59	345	56s.
A. Brunton (2 Bat) ...	85	×65	738	38s.
J. Rowden (1 Triumph) ...	85	×88	499	1m. 6s.

The next motor cycle event was the Inter-club Team Race or teams of three motor cycles entered by clubs affiliated to the A.C.U. Each team had to consist of one single-cylinder machine up to 500 c.c., one multi-cylinder up to 750 c.c., and one passenger machine up to 1,000 c.c. All had to be standard machines fully equipped. Starters were allowed. The entrants were given marks according to their relative finishing positions, i.e., the first over the finishing line one mark, the second two marks, and so on, the winning club being the one whose three riders obtained the least number of marks. No machine was adjudged to have finished unless it crossed the line less than five minutes after the first one in. The distance was five and three-quarter miles. Prizes: The winning club a trophy and each member the silver Herkomer medal, while each member of the second team received its bronze Herkomer medal. The Streatham Club turned up in great form with two teams, the first of which was a veritable power of strength, as it was composed of such famous riders as Barnes, Weatherilt, and Tessier. All twenty-two riders started together, and a very fine sight it was. Tessier led at

the first lap, and finished first, accomplishing a speed of 67 m.p.h. As all the riders started from scratch the clubs, of course, finished in a jumble, so we can only give the names of the winning clubs:

1. Streatham (1).—P. Weatherilt (3½ Zenith-Gradua), S. T. Tessier (5 Bat-Jap), and F. W. Barnes (7 Zenith-Gradua), 12 marks.

2. Herts County.—E. A. Colliver (3½ Zenith-Gradua), A. Brunton (5 Bat-Jap), and C. M. Down (7 Indian), 24 marks.

3. Streatham (2).—P. R. Hunter (3½ Triumph), H. Hunter (5 Zenith-Gradua), and G. F. Hunter (7 Zenith-Gradua), 35 marks.

The following clubs also competed: North-West London M.C.C., Middlesex County, Mersey M.C.C., Purley and District M.C.C., and Nottingham and District. H. Reed (5 Dot) and F. C. Jones (8 Zenith-Gradua) finished second and third.

The last motor cycle event was the final of the Motor Cycle Short Distance Handicap for *The Motor Cycle* cup. The finish was most exciting and a tribute to the skilful hand-capping of Mr. A. V. Ebbelwhite. Harry Reed (Dot) finished first, winning *The Motor Cycle* cup, and passing Beasley almost on the finishing line. Garrett (Regal-Precision) finished third, Bailey (Douglas) fourth, followed by Southgate (Matchless), Parker (Enfield), Guest (Matchless) and Jacobs (Singer).

## SIDECAR TRACK RECORD LOWERED.

On Thursday afternoon, while the silencer trial was being carried on, Stanhope Spencer was busy making an attempt at Brooklands to lower the existing sidecar record. Mounted on a standard 3½ h.p. Rudge fitted with a Bramble sidecar (Coventry production), he was started off by Mr. A. V. Ebbelwhite and covered his first lap at the rate of 48½ m.p.h., while his subsequent laps were run off at 49, 50, 47½, and 43½ miles an hour respectively.

Then something happened to the carburetter and a fresh start was made. Spencer made an excellent beginning on the occasion of his second attempt, as he covered the first lap, from a standing start, at 48.92 m.p.h., keeping between 48 and 50 he went well till the thirteenth lap, when a broken valve caused him seven and a half minutes' delay.

In spite of this, he broke the hour record by covering 43 miles 356 yards in that space of time. Previous best, F. E. Pither (Rudge), 40 miles 1,660 yards, 3rd October, 1911. After replacing the valve, Spencer made his fastest lap, 52.60 m.p.h., and continued to travel well till he had to stop for oil and petrol. At the end of 1h. 52m., the plug blew out and a part thereof became wedged beneath the exhaust valve. The ride was stopped at the end of two hours, and it was found that 80 miles 1,250 yards had been covered at the end of that period, thereby establishing a two hour record. The fifty miles were covered in 1h. 10m. 7s.

W. Stanhope Spencer, who set up new sidecar records at Brooklands last week.

# LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

## Oily Engines.

Sir,—I notice "Growler" is complaining of an oily engine. I think that if he fitted an extra crank case release it would overcome his troubles.

C. L. MOUBRAY.

## To Prevent Shorting Troubles.

Sir,—We notice in your issue of the 25th ult. a complaint in the latter part of "Growler's" letter that he has had trouble with his new enclosed waterproof magneto. He, together with his two friends, will no doubt be interested to know that if the high tension cable is removed from the vulcanite holder on the magneto and dipped into hot paraffin wax before being replaced, troubles from shorting, due to rain, will be at an end. Unless the magneto has been dismantled and carelessly reassembled, this point is the only possible source of trouble, which can always be cured by the means we have suggested.

THE BOSCH MAGNETO CO., LTD.,

J. A. STEVENS, Secretary.

## Bevel Gear Transmission.

Sir,—I read with interest Mr. A. Vallmed's letter in *The Motor Cycle* of the 25th ult. re his experience with his four-cylinder F.N., but I should like to point out that not all the four-cylinder F.N. machines are positive drive, for the multiple disc clutch in flywheel of my machine, and scores of others now upon the road, would completely overcome any such difficulty with the engine.

My four-cylinder F.N. (1911) engine has now taken me 5,500 miles without a single replacement (except inlet valve springs and cotters), nor have I ever been hung up upon the road for anything except punctures, which were quickly repaired.

With regard to Mr. Vallmed's remark about the strength of the bevel or spur pinions, I might mention that after I had fitted to my machine the two-speed gear in place of the fixed shaft, I wished to take off the bevel and spur wheels from the old shaft; but although I had the shaft held tightly

in a vice, and used my full strength with blows of a hammer on a cold chisel resting against a tooth of the wheel, I could not remove same (the wheels are screwed upon shaft). I then lost my temper and determined to smash all the teeth off; but in this I was also unsuccessful, with the exception of just a small chip at edge of a tooth. So much for the F.N. Company's toothed transmission wheels.

I am in no way connected with the trade or the F.N. Company.

FRITZ C. SCHOVE.

## Military Motor Cyclists.

Sir,—Your contributor "Celeriter" mentions that the A.C.U. are supplying twenty motor cyclists for the Army Manœuvres and the Legion of Cyclists forty. Apparently he is ignorant of, or ignores, the fact that sixty are being sent by the A.A. and M.U., making the total 120, not sixty, as he states.

F. W. HASSARD-SHORT.

## Ten-mile Limits in Scotland.

Sir,—As many readers of your paper may have occasion to pass through Scotland, either on holiday or business, on motor cycles, I think it only right that they should be warned against the never-ending string of ten-mile limits that obtain in some parts of that country. I have lately seen an example of this on the coast road from Gourrock on the Clyde down to the town of Ayr.

No sooner are you out of one ten-mile limit than you are slap into another one, and it is only by watching out most carefully for the little posts that one can avoid getting into trouble. Unfortunately for myself, I failed to observe the one at the entrance to the village of Fairlie, and the over sight cost me a fine of £2. I was informed, however, that the ten-mile limit posts at the next village of Largs may be ignored altogether, as they have been put up by the local authorities without the necessary powers having been obtained. I trust this warning will be the means of preventing strangers to the district from being "rushed" in the way of fines, etc.

FOREWARNED-FOREARMED.

SCOTTISH SIX DAYS' RELIABILITY TRIALS.

Trials competitors chatting over their experiences. Note the headgear. In the foreground is J. S. Holroyd's Motosacoche.

Some riders experienced no trouble and had time to waste outside controls. W. Pratt is seen above amusing Bert Yates with a small harpise.

**Pillion Seats.**

Sir,—I notice in your leader on the cyclecar you put forward as the one great hope of the sidecar its easy detachability. Many people are content with something even more of a makeshift than the sidecar, viz., the luggage carrier. The danger of the latter is its great drawback. On the other hand, there cannot be the slightest doubt that it is simply impossible to resist its use on occasions. There is a fortune awaiting the inventor of some device that will render passenger carrying on the carrier safe. H.M.

**Outside Flywheels in the T.T. Races.**

Sir,—As a reader of *The Motor Cycle* of several years standing, and an enthusiastic motorist, I should like to point out that your correspondent "G.S." is, I believe, correct in stating that both the winners of the T.T. races had outside flywheels. The Scott, I think, has not.

STANLEY C. PARFAIT.

"G.S." is perfectly right; an outside flywheel is one which does not run in the crank case. The Scott flywheel is placed centrally between the two crank cases and the driving chains are on either side of it.—Ed.]

**The Necessity for Rear Red Lights or Reflectors.**

Sir,—Yet another motor cyclist has met with an appalling death owing to the absence of tail lights. He was travelling along the main road here (Bromley) at quite an ordinary pace, and the first he knew of the proximity of a large motor van, was when he dashed out his brains on the metal arch at the back of the cart.

May I suggest that every motorist—cycle or otherwise—who may read this, should write to his member of Parliament urging him to bring the matter before the Government. Surely in these days of fast motors on the road, every vehicle should carry a tail lamp and every cycle a reflector.

KENTISH MAN.

**Steel Pistons.**

Sir,—We notice a letter signed by Mr. S. W. Philpott in the issue of July 18th warning motor cyclists against the use of steel pistons, and we consider that such a letter is likely to mislead people and do considerable injury to an important industry.

Steel pistons are now generally admitted by motor manufacturers to be the correct thing, and, whatever your correspondent may have to say as regards his particular case, steel pistons have come to stay.

We happen to be the firm whom Mr. S. W. Philpott favoured with his order for two "tiny" pistons which were made to his sample, and because they were so small a sign, in which it was impossible to effect any saving of metal with safety, he is disappointed and begrudges the money he has spent.

We have supplied these pistons to practically all the leading motor cycle manufacturers throughout the country including the firm who made his engine, who speak most highly of them, and are constantly sending repeat orders. They are evidently easier to please than Mr. S. W. Philpott.

As regards the weight, we may say that a Triumph size piston, 85 mm. diameter, made by our method weighs about 10 ozs. as against the 1½ lbs. of a cast iron piston. Then as regards the risk of damage to cylinder, this is nil, as we have not yet heard of a single case of seizure.

We are quite aware that this kind of thing happened when steel pistons were made from hot stampings, but in the case of pistons made from drawn steel tube of uniform thickness there is no unequal expansion under the heat, and therefore no risk of seizure, provided the correct clearance is allowed.

In conclusion, we may mention for the benefit of S.W.P. and others that our pistons are being regularly used on the track in motor cycle and motor car engines running up to 3000 revolutions per minute, and we have in our possession letters from amateurs and professionals who have won races which they attribute to our light steel pistons. One motor cyclist admits that he gets ten miles per hour more out of his machine than he did with cast-iron pistons, and never finds that his engine shows any tendency to seizure.

THE OXYGEN WELDING WORKS, LTD.

**Starting with a Kick-starter.**

Sir,—I have frequently found it difficult, when using the kick starter on my 2½ h.p. chain-driven single-cylinder, to get the engine to fire, though I have occasionally succeeded at the first attempt. To those who experience the same trouble my method of overcoming it may possibly be of interest.

I came to the conclusion that the valve should be dropped when the engine is about half-way through the compression stroke! It is only by chance that this happens unless the engine is first set in the correct position. By trial I found that with my machine this should be just at the end of the induction stroke. Having done this—a matter of a few seconds—on pressing down the kick starter the engine is about half-way through the compression stroke just before the end of the movement and, on dropping the valve at the same moment, the engine invariably fires straight away. It may be possible to apply the principle to other methods of starting, but having only recently taken up motor cycling I have not had sufficient experience to say whether it would be of any great advantage. S. J. EVANS.

**The Motor Cycle in Sumatra.**

Sir,—Having read with great interest various accounts of club runs in your paper, I thought a short description of motor cycling out here might be interesting to your readers.

The writer of the accompanying letter and his Moto-Réve.

Our roads are very smooth, but gritty. Agencies for the following are in Medan (our largest town): Triumph, Humber, Enfield, N.S.U., Moto-Réve and Torpedo.

On the 16th June an organised run from Bindjei to Brandan (fifty miles) took place. Fifteen of us presented ourselves at the starting post, and nine arrived at Brandan. It is intended to form a club and to have the club quarters in Bindjei.

Our great enemy here is the heat, which causes our engines to overheat very quickly. Petrol costs about 1s. 7d. a gallon, and is distilled in the country.

I might mention that nearly all the Europeans here are employed on either tobacco or rubber estates. We get two holidays a month, viz., the 1st and 16th, while we work all the other days (Sundays included). Tyres, etc., can be obtained in Medan, but the other accessories (speedometers, etc.) are quite unobtainable. There are about 5,000 Europeans in Sumatra, and about fifty or sixty motor cycles.

We have, unfortunately, comparatively few places to visit, there being only about 300 miles of good roads. I myself, whenever I leave the estate for a ride, have to have the machine carried across a broad shallow river, and this, as you can imagine, rather damps one's ardour for riding unless it is of importance. I enclose a photograph of myself and a 2 h.p. Moto-Réve, which I find ideal for this country.

Kuala, Sumatra.

H. G. GREINER.

**Acceptable Assistance.**

Sir,—Please allow me to thank you for a short paragraph you inserted in *The Motor Cycle* asking for help in the solution of a "difficult problem" with an old type engine. Glad to say response was very good. Several came to see the engine. Each and all, separately unknown to each other, pointed their finger of scorn at the exhaust cam. A new cam was made giving  $\frac{5}{16}$  in. lift instead of  $\frac{1}{16}$  in. as before, and the results are most "grateful and comforting." Engine does not now overheat, runs faster on the level, and climbs hills very much better. I was very glad of such spontaneous offers of help from unknown but very enthusiastic motor cyclists, who were ready to write letters, make appointments, call and examine and give advice with no hope of reward except to think they had helped someone out of a difficulty. Again thanking you for the paragraph.

S. WHITTAKER.

**Puncture-proof Bands.**

Sir,—As scarcely a reliability trial occurs without one or more competitors losing their place through puncture troubles, it is surprising that puncture-proof bands are not more widely used. Is it because these are inefficient or the wear on the tyres is increased in consequence of a little less "life" in them.

It would be interesting to know what per cent. of competitors use these bands, as I think they should go a long way towards eliminating the "puncture fiend."

W. D. LUMB.

**Power for Sidecar Work.**

Sir,—With regard to the correspondence in your paper as to the power required for sidecar work, my experience has been with both a  $3\frac{1}{2}$  h.p. single and the 6 h.p. twin Royal Enfield. I must say that the latter machine is more convenient to start, and is easier to control either at high or low speed, and one great advantage I find is that when coming to any hill one has no doubt in one's mind as to whether the top can be reached without the necessity of the passenger in the sidecar being asked to get out and walk. In conclusion, I would like to thank the Enfield firm for their courteous and prompt manner in business transactions with me, though I have not the slightest personal interest or knowledge of the firm.

J. T. OSBORNE.

Sir,—There is naturally a "happy medium" power both for sidecar and for solo work, and although one cannot ignore the recent wonderful performances of the Humbers and New Hudsons with sidecars, yet there is little doubt that they were being driven "all out." One has but to see the  $3\frac{1}{2}$  h.p. sidecar combination on the road to know that the reserve of power is little or nothing on top gear when a hill of any size is encountered. Moreover, I am fully convinced that the average  $3\frac{1}{2}$  h.p. single does not possess the

necessary durability for the severe strain of sidecar driving. The machine which I consider ideal for this work, and which I use myself, is the big cylinder Excelsior of 650 c.c. with three speeds. In this I find the embodiment of everything necessary for sidecar work. After various adjustments I find that the engine is at its best with a  $4\frac{1}{2}$  to 1 top gear and that it will take average hills with this at high speed with a splendid reserve, and no overheating. Who can say this of the  $3\frac{1}{2}$  h.p. single?

MYER B. LEE.

**The Low Engine.**

Sir,—A few months ago there appeared in the columns of *The Motor Cycle* mention of a Low cyclecar. The engine of this machine was said to develop an enormous amount of power, although the cubic capacity was only that of a light weight twin. Mr. Low announced his intention of entering a machine for the T.T. this year. This did not appear, and have heard two or three people say that they would like to know what has become of it.

SOMERVILLE G. TELFER.

A copy of the above letter was submitted to Mr. Low, who replies as follows:

Sir,—I thank you for your letter and note the remarks of your correspondent.

The original engine was built by myself about a year ago and was running six months after. It was very successful, giving nearly 18 h.p. on the brake at 3,400 r.p.m. with consumption of .46 pt. b.h.p. hour. The engine was a degree 2 in. x 4 in. twin, and it has run for as much as 40 hours on end at full load. Although these results were considered remarkable, the engine was very difficult to control, though giving promise of great flexibility by varying the petrol admission valve and its cut off. Being in a position to do so, I decided to perfect the engine before letting it be placed on the market, and I certainly was never so foolish as to attempt to get it out in time for the T.T., as no experimental engine can be reliable in its first stages. I have now an engine building on this principle, which I shall fit to a bicycle for testing, and while I do not want more power than in the original engine, I intend to give it reliability, flexibility, and silence before placing it on the market.

A. M. Low.

**SUMMARY OF CORRESPONDENCE.**

Mr. W. H. Edwards writes that he rode a  $3\frac{1}{2}$  h.p. Jam two-speed and sidecar in the Birmingham Club's two-day trial, not a New Hudson as officially reported.

Mr. F. Denham Tell, vice-captain of the Ceylon M.C.C. complains of inattention on the part of some makers of urgent orders for repairs, and points out that Ceylon riders are deterred from purchasing certain reliable machines solely on this account. Motor cycling, he says, is increasing in Ceylon by leaps and bounds.

SCOTTISH TRIALS. THE DEVIL'S ELBOW, WHICH IS PRECEDED BY A LONG ASCENT. J. R. Alexander (7 h.p. two-speed Indian) on the bad bend

The 1912

# REX-JAP

in the hands of private owners again proves itself  
**THE BEST SOLO MACHINE!**  
**THE BEST SIDECAR MACHINE!**

Sutton Coldfield and Mid-  
Warwickshire Automobile Club

## Hill Climb, Hints Hill, 20 July, 1912.

Class V.—(Unlimited Singles or Twins).

Mr. F. Shakespeare .. 8 h.p. REX-J.A.P., 34 secs., 1st on Time.  
 2nd on Formula.

## and FASTEST TIME OF THE DAY!

Class ix.—(Sidecars and Cyclecars).

Mr. F. Shakespeare .. 8 h.p. REX-J.A.P., 41 $\frac{3}{4}$  secs., 1st on Time.  
 3rd on Formula.

## FASTEST PASSENGER MACHINE!

Extract from *The Motor Cycle*,  
 July 25th, 1912.

"Class VI. was won by F. Shakespeare (8 Rex-Jap) in the fastest time of the day. He also made fastest time in the sidecar class. This rider had never before ridden in a motor cycle competition."

"If you have never driven one up a hill you have missed half the sport of motoring!"

## RELIABILITY!

Blackpool & Fylde M.C.C. Reliability Trial,  
 7th July, 1912.

WINNER, Mr. S. O. Taylor, 8 h.p. REX-J.A.P.  
 and Sidecar.

Blackburn M.C.C. Reliability Trial, 20 July '12.

WINNER Mr. Fletcher, 6 h.p. REX-J.A.P. & Sidecar

(The REX-J.A.P. was the only sidecar machine to complete the course and gained 199 $\frac{1}{2}$  marks out of a possible 200.)

May we post you Art Catalogue fully illustrating and describing the various models.

COLONIAL AGENTS. The Rex-Jap Colonial models are the most suitable machines for your requirements. Write for our terms. The enormous resources behind the machine ensure prompt delivery.

**The Premier Motor Co., Ltd., ASTON ROAD, Birmingham.**

Telegrams: "Primus, Birmingham."

Code A.B.C. 5th Edition (and Private).

This new edition has been revised thoroughly by the staff of "The Motor Cycle," and much new and valuable information has been added.

Every motor cyclist, and everyone who intends to purchase a machine, should possess a copy of the book. It is a reliable guide to the beginner and a helpful companion to the more advanced rider and the expert.

Commencing with advice on the choice and purchase of a machine, it tells how the motor works, and how its mechanism may be understood and mastered.

It then deals with every conceivable point in regard to the care, management, and running of machines of all types.

It is the only work of the kind published which gives details of the leading 1912 improvements.

The index is arranged alphabetically and is very copious. Numerous explanatory drawings are given.

## The FIRST and BEST book on the motor cycle.

"MOTOR CYCLES & HOW TO MANAGE THEM" was first published in 1900. Since then it has run through fourteen editions—thereby proving its immense popularity. Each edition has been thoroughly revised and brought up-to-date, and to-day the book is recognised as

## The Standard Handbook of the Modern Motor Cycle

# MOTOR CYCLES & how to manage them.

## (Fifteenth Edition)

*Revised throughout by the staff of  
"The Motor Cycle."*

Containing new chapters on cooling systems, ladies' machines, etc., and numerous up-to-date illustrations of new features embodied in the leading machines of the day.

Price 1/- net. By post 1/3.

# QUESTIONS & REPLIES

SRJ

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Camborne, Cornwall, to Ilfracombe, North Devon.

I purpose spending a week in Ilfracombe (North Devon), and should feel obliged if you will kindly inform me (1) the best route to take from here (Camborne, Cornwall), and (2) what is the total distance? I ride a  $2\frac{1}{2}$  h.p. 1911 Motosacoche. Also (3) will you kindly inform me of a change in route for returning from Ilfracombe to Camborne, and mention any bad hills on either route?—W.J.S.

Our best route would be as follows: Camborne, Redruth, Zelah, Mitchell, Bodmin, over Bodmin Moors to Launceston, and then via Holsworthy, Tarrington, and Barnstaple to Ilfracombe. The distance is approximately 128 miles. You could slightly vary the route by going back through Bideford, Hartland, Stratton, Camelford, Wadebridge, St. Columb, Padstow, Looe, Tresillian, Truro, and Redruth to Camborne. We do not know of any very terrible hills on these routes.

## Gear or Engine.

I have a forecar with White and Poppe engine, water-cooled head, m.o.i.v.; it is a 4 h.p. and has epicyclic gear. Now it will not face an ordinary hill with passenger up, and the low gear obtained by pressing pedal and tightening band is of no use, although the gear seems good enough. The engine runs well enough and the compression is good, but it does not seem to have enough power for its work. I have had a new B. and B. carburettor fitted. Can you let me know or give me any idea what is wrong? Do you think this engine is 4 h.p. from the description I have given you of it? Any advice you could give me would be greatly esteemed.—C.S.

Judging by your query, we suppose that the band brake which encircles the epicyclic gear does not hold the drum tightly enough, and in consequence the

low gear does not come into operation. Is this so, or is it that the engine refuses to take the weight up the hill and stops? If the latter takes place, the machine is either geared too highly or is not developing its proper power. If the former, the band brake requires either relining or adjusting so that it will hold the drum tightly. The engine should give about 4 h.p. at about 2,000 r.p.m. but as it may have been in use for some time, it probably requires overhauling. Examine the timing gear and see that the valve lifts at least a quarter of an inch, fit new exhaust and inlet springs. If machine is registered as a motor cycle, the lighting arrangements are exactly the same on a forecar as on a bicycle. In any case it is advisable to carry two front lights showing the full width of the vehicle for your own safety's sake. No rear light is required, but the front numbers must be illuminated, as in the case of a motor cycle.

## Exhaust Valve Timing.

My machine is a 1910 twin ( $77\frac{1}{2} \times 70$  mm.). (1.) I have just had a new crankshaft (timing side) fitted, and the machine overheats, whereas it formerly ran cool all day with sidecar attached. I had, of course, to re-time the engine, and timed the exhaust valves to close dead on top of stroke, and I find they open one inch (approx.) from the bottom of the firing stroke. Is this not very early for a stroke of only  $2\frac{1}{2}$  in.? The inlet valve cams are solid with exhaust valve cams, so have not been altered—relative to the exhaust valve timing. Magneto points break dead on top of stroke; all carburettor adjustments, etc., exactly as before new shaft was fitted.—K.M.S. The exhaust valve should commence to open when piston has completed six-eighths of the working stroke, i.e., approximately ten mm. from bottom stroke. Your valve is opening much too soon. If you set valve to open a little later and close a little later it may improve matters. Fitting the new crankshaft may have caused flywheels to be out of line or some part of the machine to be wrongly assembled, so that it throws undue strain on pistons or connecting rod bearings. What position is timing lever magneto in when magneto points break, or are just about to break? It should be fully retarded.

SCOTTISH SIX DAYS' TRIALS.

Miss Muriel Hind and R. Lord, with their 6 h.p. two-speed Rex twins; behind them P. Macdonald (4 h.p. three-speed Norton) and G. E. Cuffe (7 h.p. two-speed Indian.)

## London-Warwick-Chester.

I shall be obliged if you will kindly tell me the best road from London to Chester, calling at Warwick, but avoiding all large towns such as Birmingham, Wolverhampton, etc. I should like to vary the return journey *via* Shrewsbury by some pretty route. Should there be any hill *en route* of single figure gradient, I should like to have particulars.—FB 601.

Your best route would be as follows: London, Barnet, St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, Daventry, Southam, Warwick, then continue through Stratford-on-Avon, Alcester, Headless Cross, Bromsgrove, Kidderminster, Bridgnorth, Wellington, Whitechurch, to Chester. You can return *via* Wrexham, Shrewsbury, and then along Watling Street, through Weston, Weeford, Atherstone, Daventry, and by the same route as on the outward journey. We do not know of a single figure average gradient on this route, but there is a long rise between Kidderminster and Bridgnorth.

## Engine gets Red Hot.

I should like to know if a 2 h.p. lightweight ought to carry ten stones along a level road at twenty miles per hour without the engine getting too hot for the hand to bear. The lightweight engine I possess gets almost red-hot very soon after starting, but this does not seem to affect its running.—J.C.W.

Very few, if any, air-cooled motor cycle engines will run cool enough to allow the hand to be placed on the radiating fins of the cylinder. This is only possible in the case of a water-cooled engine. In the old days it was no uncommon sight to see the combustion head of a motor cycle engine glowing at night, but improvements in cooling have been made since then. Your engine should not get red hot. If it does there is something wrong with it. Either the exhaust gas does not get away quickly enough, or you drive with the throttle too far open, taking into consideration the amount of work the engine is called upon to do, or the ignition is not sufficiently advanced.

A simple chain adjuster introduced by Brown Bros., Ltd. The ends of the chain are drawn together with a uniform tension by screwing the fly nut.

## Valve Timing.

My 1911 engine, 85x85 mm., has not yet run 200 miles. Although oiled copiously, it stops through overheating after only about twelve miles of practically level running. It knocks badly on the least provocation, and will take very little air. Suspecting the timing of the engine, I tested it according to "Motor Cycles and How to Manage Them" with the following astonishing results. Inlet begins to open  $\frac{3}{16}$  in. before the top of the exhaust stroke and closes  $\frac{3}{16}$  in. up the compression stroke. Exhaust valve opens  $\frac{3}{16}$  in. before bottom of firing stroke and closes  $\frac{3}{16}$  in. down induction stroke. Will this account for the overheating, and can it be altered? If so, how?—T.G.

The engine seems to be timed with an overlap in the valves which is supposed to be the best practice for getting high speed out of an engine. We do not think this would account for the overheating trouble. Probably you are using a jet which is too large, or you are not using suitable lubricating oil. Buy only the very best brands of motor cycle oil for lubricating, and be sure that it is in a sealed tin, otherwise you may purchase oil which is ruining the engine. As the engine will take very little air, this points to the fact that there is an obstruction somewhere in the petrol pipe or carburettor which would cause symptoms similar to those of over-heating. We should advise you to take down the carburettor and clean it thoroughly, examine the petrol pipe, and change the lubricating oil.

## Cracked Piston.

(1.) Would you mind informing me if there is any danger using a cracked piston? Is it possible to have it welded to give satisfaction, it being  $3\frac{1}{2}$  h.p. with the rings one at each end of the piston, and the crack, very large, about  $\frac{3}{16}$  in. long, across the bottom slot? (3.) Would it cause loss of compression?—E.G.

(1.) Yes, considerable danger. If the piston broke it would probably cause a lot of damage, which would be very much more costly than replacing at once with a new piston. (2.) Electrical welding is satisfactory in some cases, but it is quite impossible to say whether it would be satisfactory in the case of the piston question. What we should advise you to do would be to communicate with a firm undertaking electrical welding, send them the piston, and ask them if they can make a satisfactory job of it. In any case the piston would have to be machined after the welding if the crack crossed the ring slot, and probably a new piston would be cheaper in the long run. (3.) It depends entirely on the size of the crack whether it would cause loss of compression, but we should be inclined to think it would, as in all probability the crack opens when the engine is started.

## EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"F.J." (Reading).— $2\frac{1}{2}$  h.p. Doug two-speed with light sidecar.

"F.D.O." (Tottenham).—Kempsha with 4 h.p. sidecar combination.

"L.F.C." (Simonsdown).—6 h.p. Sing tricar converted to sociable.

"G.W.L." (Derby).—Two-speed gear and free engine clutch for fitting to 5 h.p. 1910 Indian.

"T.W.L.C."— $2\frac{1}{2}$  h.p. Levis. Coolant of running and lubrication.

"Humber" (Salisbury).— $3\frac{1}{2}$  h.p. 19 two-speed Humber, with sidecar.

"R.A." (Bombay).—Glover cyclecar.

A TEST HILL IN THE SCOTTISH SIX DAYS' TRIALS.

The hairpin bend on Rest and be Thankful, which unseated many riders. Bert Yates ( $3\frac{1}{2}$  h.p. Humber) is seen successfully round, after having passed his stable companion F. G. Edmond, who ran on to the loose stones on the inside of the bend.

## HUILE DE LUXE

Two Grades { Summer  
Winter

WAS USED ON THE

### First Six Machines

FINISHING IN THE JUNIOR

### Tourist Trophy Race.

HUILE DE LUXE is the finest lubricant ever produced for medium and lightweight machines.

The Summer grade is specially suitable for powerful sidecar engines, such as Chater Lea, Clyno, and Enfield, running under average conditions.

It is the fatty matter which is lacking in other oils, which has lifted Huile de Luxe to its present enviable position.

Huile de Luxe gives clean and delightfully free running and no "gumming up!"

Huile de Luxe was used by C. E. Murphy in the Irish End-to-End Reliability Trial.

Richard Burbidge, Managing Director,

BROMPTON ROAD, LONDON, S.W.

**95 GUINEAS, ready for the Road.****SATISFIED CUSTOMERS.**

20/3/12. "The Rollo is running extremely well—in fact, far better than I anticipated. She holds the road perfectly."

18/4/12. "I like the Rollo very much, and wish you every success."

29/4/12. "The machine is running very well, and attracts a good deal of attention."

8/5/12. "I have now done about 800 miles on the car, and am very pleased with it. The car easily does 35 m.p.h., although I have not tried it all out. It also climbs very well. Everybody I meet is much interested, and I should think you would have plenty of sales here."

17/5/12. "The car runs all day like a clock."

1/6/12. "I am still getting satisfaction out of my car. . . I hope you are getting plenty of orders."

**AND MANY OTHERS**

Catalogues and full particulars from **The ROLLO CAR Co. Ltd., Conybere St., Birmingham (Eng.)**

**100 GUINEAS, with Windscreen and Hood.****THE RELIABLE ROLLO.**

The Premier 4-wheeled Cyclecar. Fast, Safe, and Simple.

**SATISFIED CUSTOMERS.**

20/5/12. "I should like to tell you that my car is going beautifully at present. . . It has climbed Dashwood Hill with 24 stone up, also three suit cases, spare tyres, oil, and petrol."

25/5/12. "I fully endorse the testimonials you have received. The little car is a marvel, and goes wonderfully."

31/5/12. "I should like you to know that I am delighted with my Rollo car. I can drive and control it perfectly, and have indulged in scrapping with eminently satisfactory results. With two up and luggage I passed five cars which were all endeavouring to pass one another to avoid the dust, and have attained a speed of 47 m.p.h. I also left an 8 h.p. . . and sidecar on the road. This would have beaten me if it had not been for your variable gear. Please accept my best compliments."

**AND MANY OTHERS.****The Guest Decompressor.**

# CORONET SIDE CARS

## SAVE YOUR POWER

by fitting a Coronet—very little power required to drive. Lightest and strongest. Send for illustrated catalogue.

CAN BE OBTAINED FROM ALL DEALERS.

Model 1. High-class Canoe-front Body, Cranked Axle, and other improvements, £6 6 0.

Model 4. Ornamental Cane Body, as illustration, or Close Reed Cane Body, £8 8s.

**CORONET DETACHABLE JOINTS** enable our side-cars to be detached in one minute.

We illustrate herewith the "Coronet" Quick-detachable joints, which are fitted to all our models. To detach is simply a matter of unscrewing nut about five threads. When attached, and nut screwed tight, the joint is solid and perfectly rigid, and does not rattle like some patent joints held in position by springs and pins that are liable to shake loose.

### MAGNETOS. MAGNETOS. MAGNETOS.

We have a large stock of the best makes from 50/6. Your old coil and acc. taken in exchange.

Read what users say: 14, Warwick Road, New Southgate, N.

Dear Sirs,—Some time since I purchased from you a sloop-sided sidecar, and after running same for about 3,000 miles felt I should like to let you know how very satisfactorily it has been running. The chassis is now as true all over as on the day it was delivered to me, and that in spite of being run on many occasions with two passengers and under the worst of conditions.

After seeing the sorry turn-outs some of my friends have paid three times as much for, after barely 1,000 miles' running, I feel it only due to you to send this appreciation with the usual disclaimer.

You are at liberty to use this letter as you please, and to give my name and address to any enquirer. Personally I have, and shall, always recommend a "Portland" to anyone who wants a practical and thoroughly efficient sidecar.

Yours faithfully,  
(Signed) W. E. BAKER.

A New Hudson rider says:

I think this is good evidence of the strength and reliability of your machines.

The way we go up hills is simply marvellous. The machine simply advertises itself wherever it goes, and causes a lot of attention with one of Maude's "Dutch Clog" sidecars attached.

I have driven both motor cycles and cars for over five years, and have never had a turn-out give such satisfaction.

You can use this letter if you like, but I expect you have any number of such letters.

(Signed) G. S.

### MOTOR BICYCLES FOR SALE.

4 h.p. Champion-Jap, late 1911, Palmer cord tyres, lamps, equal new.—Georgia Walker, jun., Walsley, Sheffield. [X8645]

SCOTT, 1911, just overhauled by makers, absolutely perfect condition, spares; £45.—Tunstall, draper, Hindley. [X8707]

1908 Triumph, £28, splendid order, X'Fall saddle, all accessories.—Fielding, tobacconist, Hebden Bridge, Yorkshire. [X8657]

SCOTT'S, 1912, immediate delivery; 6 in stock; no waiting; £65; deferred terms arranged.—Hitchens, Morecambe. [3184]

MATCHLESS, 2-speed, 1912, all models in stock; no waiting; deferred terms at list price.—Hitchens, Morecambe. [3185]

CLYNOS, 1912, with or without sidecars, 6 in stock; deferred terms at list price; no waiting.—Hitchens, Morecambe. [3186]

1912 Ridges, all models, discount for cash, list price on deferred.—Hitchens, Morecambe. [3187]

BRADBURY'S, 1912, all models, immediate delivery, no waiting; list price on the deferred.—Hitchens, Morecambe. [3188]

HUMBERS, 1912, 3 1/2 h.p., 2-speed; immediate delivery; list price on deferred.—Hitchens, Morecambe. [3189]

INDIAN, 1912, 7 h.p., 2-speed; immediate delivery; cash or deferred. Why wait?—Hitchens, Morecambe. [3190]

DOUGLASES, 1912, all models in stock; no waiting; special terms on the deferred.—Hitchens, Morecambe. [3191]

PREMIER, 1912, 2-speed; list price deferred; discount for cash.—Hitchens, Morecambe. [3192]

BAT, 1912, chain drive, immediate delivery; deferred terms arranged. Why wait?—Hitchens, Morecambe. [3193]

BRADBURY, 1912, free engine model, not ridden 50 miles; sacrifice £10.—F. Anders, 38, Platt Lane, Hindley, Lancs. [X7477]

1912 6 h.p. Enfield Turnout, new Juna, latest improvements; £70.—W.F. and Co., 5, Cheltenham Parade, Harrogate. [X8787]

RUDGE, T.T., 2-gallon tank, perfect condition, only done 350 miles.—Jones, 159, St. Anne's Rd. East, St. Anne's-on-Sea. [X8696]

LIVERPOOL.—1911 Royal Enfield, 2 1/2 h.p., guaranteed faultless; trial; everything on; £35.—McAdam, 276, Scotland Rd. [3164]

1912 New 3 1/2 h.p. B.S.A., 2-speed, free engine, done 50 miles, new 10gn. sidecar; £62/10.—Crown Garage, Scarborough. [3165]

1912 2 1/2 h.p. Humber, Armstrong 3-speed, spara tyre, belt, and lamp, done 300; £40, cost £58; owner bought Clyno.—Above. [X8525]

MINERVA, 3 1/2 h.p., h.b.c., adjustable pulley, splendid running order; £8/10.—Parr, 279, Warrington Rd. Lower Ince, Wigan. [X8551]

MERRICK for Bradbury, Chater-Lea, Rudge, A.J.S., Matchless, etc.—Merrick's Stores, Listerhills, Bradford. Phone: 2439. [0038]

TRIUMPH 1911, free engine, complete with lamp, horn, tools, etc., perfect condition; £38.—Sutcliffe, 34, George St., Oldham. [X8558]

HUMBER Lightweight, 1911, 2 h.p., lamp, generator, horn, etc.; £23; getting combination.—Lees, Hamilton St., Bury, Lancs. [X8661]

ROYAL Enfield, 1911 1/2, 2-speed, free engine, new condition, climb anything; £35.—Race, Harcourt Place, Scarborough. [3266]

NEW Unused 6 h.p. Twin Zenith; cost £70; as cannot meet account, will sell £62/10 cash.—Johnson, 18, Castle Park, Lancaster. [3125]

1911 B.S.A., standard model, only done 4,000 miles, all in new condition; £37.—Wilson, Crossfield House, Farsley, near Leeds. [X8694]

3 1/2 h.p. T.T. Triumph, 1912, exceptionally fast, just completed 100 miles, complete; what offers?—26, Carter Knowle Rd., Sheffield. [X7999]

REX, 3 1/2 h.p., 1908, new in 1909, Bosch, B. and B. excellent condition; £18, or close offer.—Hudson, 89, Albert Rd., Colne, Lancs. [X8601]

RUDGE, 1912 1/2, free engine, done 120 miles, guaranteed perfect throughout; £45.—Walmsey, 12, School St., Accrington, Lancs. [3321]

BAT-J.A.P., 6 h.p., late 1910, clutch, spring frame, Bosch, carefully used, very fast, reliable; £36.—Arnott, Fife Rd., Darlington. [3122]

MOTOR Cycle for sale; 4 h.p. Trump-Jap, as new, not ridden 200 miles; list price £48, accept £34.—Sanderson, Station Garage, Fifeley. [3327]

TRIUMPH, 1912, free engine, not done 1,000 miles, perfect, lamp, horn, usual spares; £50, no offers.—J.H.G., 37, Sankey St., Warrington. [X8003]

1911 3 1/2 h.p. Rex Tourist, free engine, spares; £30; condition as new, runs 110 miles to gallon; private owner.—Larrad, Horbury, Wakefield. [X8560]

1912 Motor Cycles, must be cleared; 3 1/2 h.p. Zenith £50, Model G. Douglas £41, P. and M. £60. Scott £65.—Greenland, agent, Carnforth. [3124]

### The Silencer Tests.

THE Auto Cycle Union silencer tests, reported last week, have shown that the best quietening effect is obtained by passing the gas first into an expansion chamber twelve inches long and five inches diameter, the final exit being through a pipe five-eighths of an inch diameter. The tests are most interesting, and confirm the statements repeatedly made in these pages that silence without back pressure can only be obtained by adopting a fairly large chamber into which the gases can expand. Theoretically, this chamber should hold about six times the volume of the cylinder capacity. The capacities of the cylinders on the motor cycles used for the test were approximately thirty cubic inches. The cubical contents of a silencer or expansion box twelve inches by five are two hundred and thirty-six cubic inches, or nearly eight times the volume; therefore, theory and practice once more agree when the practice is sound. Manufacturers have now to produce a small exhaust box which will give the same quietness. In our opinion they will never secure the same result with a small box, either by means of baffle-plates, small holes, and other similar devices, without a certain amount of back pressure. The correct principle of exhaust gas silencing is to expand the gas and allow it to cool.

Articles published in *The Motor Cycle* as far back as 1903 and 1904 showed that exhaustive experiments were made in Great Britain and on the Continent with motor cycle silencers, and that the best results were obtained by using a moderate sized expansion chamber and a pipe from it, the latter being sometimes subdivided into two or three branches.

Very few makers will agree to disfigure their machines by the addition of large silencers and ugly pipes, with the result that motor cycles have a reputation for noise.

All the noise of the exhaust does not come from inadequate silencers, as we have already explained; a good deal of it is due to valve cam design and valve timing. Generally speaking, efficiency means noise at least from the exhaust, although it is possible to have great noise and very little efficiency.

### Motor Cycle Taxation.

A FEW weeks ago we drew our readers' attention to the case of a North-country motor cyclist who uses his machine for business. This rider for two or three years had made use of a motor cycle for purposes of business. He claimed exemption in the first instance, and the Inland Revenue officers did not press him for payment; in fact, he has documentary evidence in his possession that they considered he was exempt. On the introduction of the new motor cycle taxation of £1 and the taking over of the collection of the tax by the local authorities, this motor cyclist received a demand for payment of the tax, and naturally referred the authorities to the previous ruling.

They pressed the case, and when our advice was asked we recommended the rider in question to lay his case before the Auto Cycle Union, who decided to take action, and it is probable that the hearing will take place at Barnsley on the 9th inst.

This test case will settle once and for all a vexed question in motor cycle taxation.

# Nearly 80 m.p.h. on the Open Road.

An Early Morning Attempt to Win a Wager.

A privately arranged attempt to cover 80 m.p.h. on the road on an 8 h.p. Zenith-Gradua. (1) Breaking the tape of the electrical timing apparatus at the start, and (2) at the finish.

**B**ED pulls very much at 4 a.m., especially after returning at midnight; but still the occasion was worth it and we all tumbled out, ducked our heads into cold water, and stood in the hall of the hotel clamouring for hot coffee, which the alert landlady was endeavouring to produce.

The reason of this rising in the wee sma' hours was because we hoped to see one of the finest riders in the North of England win a wager of — well, never mind how much, by doing eighty miles per hour over a measured quarter of a mile. After the hot coffee, we proceeded at well over the legal limit to the rendezvous, a dead level and straight piece of road about six miles away from the hotel. Here, in contrast to the quiet and peaceful country side at that early hour, everything was bustle and argument. Some were busy measuring the course to a fraction of an inch, others driving in the stakes and laying the wires of the electrical timing apparatus, and last, but not least, the stripped machine, with its open exhausts, was being finally looked over.

## The First Attempt.

At last everything is ready, the rider cannons down the road a mile away to get a flying start, and after what seems an age, we hear a sound like the hum of an aeroplane engine, and hardly before we have time to realise what has happened the machine with its rider has thundered down the course, the very ground trembling as he passed. "What was his time?" everybody anxiously enquires. "Has he done it?"

11 $\frac{1}{2}$ s. only 76.27 m.p.h. However, he has two more chances to win the wager, and after one or two minor adjustments he goes down for his second attempt. Again he thunders past, and although he is hurled along at such a terrific pace, his course is as straight as an arrow. We could all tell he had improved upon his previous time, and there was a yell of delight when we found that he had knocked two-fifths of a second off and so accomplished 78.95 m.p.h. There was still another chance. Could it be done? The excitement grew intense, for we all knew that the rider had only to improve his last time by a bare one-fifth of a second and the task was accomplished.

Once again, and for the last time, the thread of the timing apparatus is broken, and one can imagine our feelings and our opponents' joy, when we hear that he again only equalled his second performance by doing the quarter in 11 $\frac{1}{2}$ s. or

## 78.95 Miles an Hour.

It was almost exasperating to be so near and yet so far. Few people realise what a fifth of a second means at such terrific speeds, but they cannot help seeing it when it is shown thus: Over a quarter mile course 11 $\frac{1}{2}$ s. = 80.36 m.p.h., whereas over the same distance 11 $\frac{1}{2}$ s. = 78.95 m.p.h. Therefore one-fifth of a second makes a difference of 1.41 m.p.h., and to further show how near the rider came to winning his wager, if the course had been seven yards shorter he would have accomplished 80 m.p.h. S.

LYNTON HILL, LYNMOUTH, ONE OF THE TEST HILLS IN THE A.C.U. SIX DAYS' TRIALS. Riding a 2 $\frac{1}{2}$  h.p. Premier lightweight, H. Bunce recently succeeded in climbing the notorious Lynton Hill. He is seen above negotiating the two hairpin bends.

# Round the Scottish Trials as a Free Lance.

BY "THE MOTOR CYCLE" REPRESENTATIVE.

ASCENDING GLENDOE, A SCOTTISH TRIALS TEST HILL.

The competitor is W. Pratt (3½ h.p. P. and M.) who won the Trade Rider's Frize.

As a camera man feelingly observed to me, in every trial the pressmen have about twice as much work as anybody else, and they get no medals when all is over. This particularly applies to the Scottish Trials. However, like the rest, I had a thoroughly enjoyable week, and came home bronzed and carrying extra weight.

Reviewing the Trial as a whole, I noticed one vast contrast between this and all previous six-day events, for nobody except the sidocar drivers ever felt any anxiety about the hills. In previous trials, both English and Scottish, there has always been a certain atmosphere of anxiety about the worst test hills. We had, as usual, the handful of weaklings who cannot climb Dashwoods with certainty, but the vast majority of the entry never worried about the hills; they knew that their variable gears would take them up any gradient, and if they should mull an acute hairpin a clutch restart would be easy. Such small machines as Douglas, A.J.S., and Motosacoche went up some of the worst precipices in Scotland. By the way, I did not encounter a single case of trouble with gears—and this although they were roughly used, with very frequent changes, and often employed as brakes, bottom gear being jerked in against the compression when a machine was travelling too fast near a bad corner.

The second point that struck me was the extraordinary number of accidents. Quite a formidable proportion of the entry fell out through smashes of one sort or another; I am afraid these were principally due to criminally bad driving. In Scotland a by-road is continually trying to suck its own tail, and the resultant corners are as blind and prolonged as they are often unexpected. The chancy type of driver is bound to come to grief on such roads, though the Trials were well advanced before all the clumsy sort were eliminated.

These dangers were enhanced by deep pot-holes and loose surface, which often threw a machine right across the road and caused expert cornerists some breathless moments.

The third feature was the grand show put up by the passenger machines, over roads which are only fit for careful soloists. The two G.W.K. cyclecars electrified us all, especially on the hills, though one of them enjoyed the poorest of luck. The Bat and the 5 h.p. A.J.S. must have left home on a Friday. Smith's Clyno put up another perfect score; Smith says he always alters some points of design after a trial, and I suppose he will now strengthen the chainstay lug. Hugh Gibson had a very gruelling time, and proved what a magnificent driver he is. But personally I thought Bischoff's easily the finest per-

TEST HILLS IN THE SCOTTISH TRIALS.

A G.W.K. cyclecar climbing Rest and be Thankful.

Vernon Taylor (3½ Rudge) on the S bend of Glendoe.

H. G. Bell (New Hudson) on Reinloan.

formance in this class, even though putting a 3½ h.p. sidecar round this route is a freakish job, like going out to shoot lions with an air-gun. He enjoyed splendid luck, escaping without a puncture for instance; but I do not think there are many men in England who could duplicate the performance.

Hugh Gibson, I thought, attempted too much. He was obviously anxious to take his passenger up all the hills, and put his outfit to frightful strains in the attempt, with the result that his tyres gave trouble. Bischoff nursed his machine and tyres, and made it his single aim to finish up to time.

The fourth point was the excellent lightweight display. The special prize awarded to the 2½ h.p. A.J.S. was quite deserved. It was a single entry, not the pick of a large team; the engine pulled like a team of elephants, and it was beautifully handled.

In the 500 c.c. class many well-known machines gave the display we should expect. Amongst comparative newcomers the Rover finally earned its spurs. W. Pratt's win on the P. and M. is well merited.

#### A Modern Three-speeder.

I accompanied the men on a Triumph with Armstrong hub, and enjoyed the mastery over hills which a modern 500 c.c. engine with a three-speed hub

always ensures. The machine made clean ascents of every hill except the S bend on Glendoe, and that failure ranks against its rider, for carburetter reasons. I had to use an improvised jet to replace a broken one—naturally the adjustment was not quite correct. My hub control was adjusted once, and the gears were oiled whenever I found time—say thrice during the week. Adjustments and condition were perfect on the Saturday night. I escaped with one heavy spill, due to running on to new metal when rain had converted the dust on my goggles into an opaque paste. For the first three days I enjoyed a picnic, save for a few punctures. But it is plain that the roads were severe on tyres, or I was particularly unlucky if I say that by Saturday night I had practically exhausted my third repair outfit, that both covers were heavily reinforced with canvas, and that each had a large gaiter inside it. Kind friends hint that my plethora of punctures is due partly to the extra speed required from a press representative, and partly to my being too shortsighted to see nails lying on the road! Here I think they must be pulling my leg. I can understand a man spotting a broken bottle on Brooklands, but how anybody can spy a shepherd's boot nail on the lochside tracks puzzles me.

F. C. North (Ariel) and C. M. Keiller (G.W.K.) negotiating the S bend on Glendoe.

The two twin Rexes, Miss Hind and R. Lord up, on Glendoe. "The Motor Cycle" photographs were the only ones taken at this point.

## Round the Scottish Trials as a Freelance.—

My worst moments of the week were as follows:

(1.) Arriving lunchless at the foot of Cockbridge Ladder about 4 p.m. after ten hours' work; I knew I was ahead of the men, and dashed up to the hotel door with my purse out to read the following notice, "Closed till 6 p.m." Luckily I coaxed the landlord down from the worst corner.

(2.) Getting a huge staple through the back tyre after twelve hours' work, when I was still sixty miles from our destination for the night.

### More Troubles.

(3.) The carburetter got full of water, and after taking the usual methods to empty it I found it necessary to dismantle. I was using an experimental carburetter of peculiar design, and in my hurry I broke the jet in half. I was miles from anywhere, it was pouring with rain, and I had no jet of any sort or kind. Luckily a Triumph passed, and the rider had a spare. Then my trouble was to make the large hole in his jet as small as the original, which is essential when your

J. S. Holroyd (Motosacoche) successfully round the S bend on Kenz ore. Holroyd, as usual, gained top marks in this severe trial.

Scottish Trials competitors crossing Bonar Bridge in the pouring rain on Thursday.

brush's stump left to get a spark by a little faking. Subsequently I found water had got into the magneto despite my improvised tent, and I had to seek the shelter of a neighbouring farm, where I soon put things to rights. The farmer put me in a shed with about thirty young turkeys—execrable farmer! When the engine started up there was a tremendous fluttering and clucking of young turkeys. However, who cares when the engine is going? Further on I borrowed from a local rider of a Triumph a full length carbon, and my magneto troubles were at an end. I shall carry a spare carbon brush in future. In conclusion I should like to mention the organisation and management of the Trials, which reflect the greatest credit on the Edinburgh and District M.C.C.

air supply is invariable. I soldered it, and borrowed a drill from a watchmaker; the drill dated back to the Stone Age, being of the bow and pulley order, and I shudder to remember how often we had to grind a new point on that drill.

(4.) Breaking the carbon brush of my magneto in pouring rain. When the engine stopped I tested the spark and found it good. I wasted twenty minutes (like a fool) searching in every other direction. Then I came back to the ignition, and this time there was no spark, to my joy, for at least I had narrowed the field. Traced the cause to a broken high tension brush, and tried to remove it by external means; fished with a bent wire tipped with solution; no catch. At last hung my waterproof over the back wheel, so making a little tent, sat beneath in the sopping road (my mackintosh unmentionables are seatless!) and took the magneto all to bits; recovered the fragments of the brush, which had caused a lot of sparks where I did not want them, and joy! found enough of the

Geo. E. Cuffe (Indian) falls among the bracken in attempting the S bend on Glendoe.

# A New Variable Jet Carburetter.

A Compact Instrument, completely Controllable from the Saddle.

**E**VEN the merest novice knows that a single jet carburetter cannot supply all requirements on a motor cycle. It is obvious that in level districts a small jet is required if petrol is to be economised, but in hilly country a big jet is a *sine qua non*. Consequently the manufacturer who uses a single jet carburetter is obliged to strike the happy medium, with the result that at times petrol is being

in that case it would be necessary to keep the jet lever closed tightly when the engine is not running. As the throttle is opened, the cone forming the jet is raised in unison with the throttle opening by means of a specially constructed screw which gives a correct sized jet at all speeds.

The amount of "lift" to this jet for a  $3\frac{1}{2}$  h.p. motor cycle is approximately .009 from closed to full open. This, of course, can be varied to suit any machine. It follows, therefore, that the area of the jet is automatically increased with the throttle opening in the correct proportion.

## Effect of the Variable Jet.

The 4 h.p. sidecar machine on which we used the S.D. carburetter was vastly improved by the conversion, and hills on which it previously toiled were now rushed on top gear by the simple expedient of opening the jet slightly. In the ordinary case the air lever is partially closed on hills to enrich the mixture, thus reducing the charge when actually you want more, but with the S.D. the barrel, which controls the throttle and air openings in the manner of a "straight through" plug tap, is opened to the full, and if a stronger mixture be desired the jet is raised by means of the top lever. By reason of the fact that the right jet opening is used for all positions of the throttle, the consumption is considerably reduced. We covered just over eighty miles (Coventry to the Peak District) on the first gallon of petrol under favourable conditions, passengers' combined weights 19½ stones, about seventy miles on the second gallon over wet roads and sixty miles on the third gallon on sticky roads and against a strong head wind. The varying conditions exactly suited our test. In the case of the last run (Newark, Notts, to Coventry) slow progress would perforce have been made as there was a gale of wind, but increasing the jet opening enabled over 20 m.p.h. to be averaged and every hill—including Bunny Hill, near Nottingham—ascended on top gear. The S.D. is the first carburetter we have sampled which enables an engine to turn over so slowly that the explosions can be counted with ease, and by doing no more than manipulating two levers cause it to develop a continued roar of explosions. A choked jet is a thing of the past with this carburetter. Should an obstruction be suspected, the lever is opened slightly and the foreign matter thus freed. We predict a big future for the S.D. It should appeal to the speed man as well as the every-day tourist.

Showing the compact appearance of the S.D. carburetter. It is of the straight through type.

Section of the new "S.D." variable jet semi-automatic carburetter.

needlessly wasted, and yet frequently a hill proves too much for the machine simply because the jet is not large enough. The question is almost on a par with the change-speed gear problem. In the case of variable gear or variable jet, the selection is governed solely by the prevailing conditions, but with a fixed gear (or jet) a machine has its limitations in either direction.

## Complete Controllability.

A variable jet opening and a variable main air supply has been the writer's pet fad for years past, and consequently a proffered trial of a new design automatic carburetter known as the "S.D." was accepted with alacrity. The carburetter is made by the Sydenham Mfg. Co., Sydenham Road, Birmingham, and it is shown in section in the accompanying illustration. As will be seen, the carburetter has an annular jet, the orifice of which is only .005 wide, but, being spread around a circle of 9-16in. diameter, the petrol issuing therefrom must of necessity be almost perfectly atomised. With a large single jet, petrol issues in blobs and is imperfectly broken up.

The S.D. is controlled by two handle-bar levers of the ordinary kind, the upper controlling the opening of the jet independently of the throttle, the lower one the throttle, jet, and air openings.

The action is as follows. The conical jet is closed tight when the throttle is closed, and consequently, if desired, a float chamber can be dispensed with, but

# DUNLOP

It is not only in speed,  
it is in all-round use that  
**DUNLOP TYRES and BELTS**

have demonstrated their superiority season after season, and they are doing it more convincingly than ever this year—not in one event alone, nor in the hands of a few riders, but in all kinds of competitions open to private riders throughout the country.

Typical examples of Dunlop successes.

**SUTTON COLDFIELD A.C. MEMBERS' HILL-CLIMB.**—Eight places on Dunlop tyres; nine places with Dunlop belts.

**SOUTH WALES A.C. and CARDIFF M.C.C.**—Eleven places on Dunlop tyres in the hill-climb at Caerphilly; ten places with Dunlop belts.

Four places (three firsts) on Dunlop tyres in the speed trials at Porthcawl; three places and fastest time with Dunlop belts.

Competitors anywhere can reap the same rewards provided their machines have the same equipment.

## Nine Months' Experience with a New Hudson.

**A** WEEK'S experience last year in the Isle of Man with a 1911  $2\frac{3}{4}$  h.p. three-speed New Hudson was the inducement which caused us to place an order with the New Hudson Cycle Co., Birmingham, for a 1912 model of the same power.

This machine was delivered last November, and has been ridden regularly ever since, so we are in a position to speak of its capabilities. When we say that its reliability is second to no machine the writer has ever ridden it is saying a good deal, for he has owned many of the best machines on the market. Its speed capabilities are remarkable when the c.c. of the J.A.P. engine is taken into account;  $70 \times 76$  mm. is only 292 c.c., yet with this comparatively small engine the machine is capable of an average touring speed of about twenty five miles an hour, and for a short distance on top gear a speed of 45 m.p.h. can be attained. Owing to the Armstrong three-speed gear hill-climbing is its strong point, and it is very fascinating to know that there is no hill too steep for it. The extreme comfort of this knowledge adds considerably to the pleasures of a ride in strange country, where one never knows when the next corkscrew ascent may loom up in front. Riding this little machine with its change-speed gear giving ratios of  $4\frac{1}{2}$ ,  $6\frac{1}{2}$ , and 9 to 1 was quite a new experience for the writer, who had previously owned mostly heavyweight single geared mounts although trying change-speed gear machines from time to time.

### Renewals, Belts, and Tyres.

Coming to the question of the machine's behaviour during the past nine months, when we say that it is one of those which can be ridden week end after week end without attention beyond filling up with petrol and oil and cleaning, we have said enough to convince the reader of its absolute reliability. The only renewal has been an exhaust valve and spring, and they were merely fitted to obviate the necessity of regrounding the old valve. The com-

pression is almost as good to-day as when the engine was new, and no trouble whatever has been caused by the added complication of a change-speed gear. We always make it a practice to lift the exhaust valve

before changing, not because it is necessary, but the loss of way so caused is slight, and wear on the dog teeth of the gear must be thereby lessened. Every two hundred miles the gear and clutch are well lubricated with thin bicycle oil in accordance with the makers' instructions, which are printed in gilt letters on the tank, and the adjustment of the gear change rod is checked every few weeks; if it be found incorrect it is a moment's work to reset it. Tyre and belt wear are extremely small, as the original Dunlop rear cover is still on the wheel, and the  $\frac{3}{4}$  in. Lyso belt on the pulleys; both appear good for a considerable distance.

### Useful Refinements.

It will be noticed on reference to the illustrations which accompany this article that the change-speed lever is in a convenient forward position on the top tube, that the tank is provided with gauze filters to petrol and oil compartment to prevent the spirit washing about. The magneto control is on the handle-bar, a great convenience, particularly in the case of small engines where the magneto contact breaker can be advantageously retarded and advanced more often than is usual with larger motors. The carrier and rear guard are readily detachable; one of the illustrations shows this. Slots are provided at the stay ends, so the pins attaching them to the frame merely require to be loosened.

Many imagine that a lightweight is only capable of carrying medium weight riders, but the writer finds his 13 stones not the least bit too heavy for the

$2\frac{3}{4}$  h.p. New Hudson, and on the first speed ratio of about 9 to 1 hills of 1 in 6 are easily negotiated with a hot engine.

One week-end ride with this machine which will always be remembered was a run to North Wales,

Plan view of the  $2\frac{3}{4}$  New Hudson showing gear and clutch controls, etc.

### Nine Months' Experience with a New Hudson.—

when the route taken was Coventry to Shrewsbury, Lake Vyrnwy, over the mountain road to Bala, up the easy side of Bwlch-y-Groes down to Dinas Mawddwy, and home through Llanfair and Welshpool. The whole of this run was accomplished without a falter—wait, there was one small adjustment, a pin which connects the clutch operating rod to the bell crank jolted out and had to be replaced with the

New Hudson petrol and oil tank. Note the double partition, gauze filters, and baffle plates.

nearest substitute provided by a small Welsh cycle shop in the shape of a large split-pin.

This calls to mind one little improvement that might be worth the makers' attention, viz., to make all the pins for clutch and gear controls a little longer and split-pin them. Change-speed gear machines are particularly likely to shed bolts and nuts which are not securely pinned or lock-nutted. We attribute this partly to engine vibration set up when the machine is

climbing long rough hills on a low gear ratio, as from our experience any bolt or nut which works loose can usually be traced to a previous single figure climb on low gear with the engine turning over at its highest speed.

Detaching half the rear mudguard and carrier to facilitate tyre repairs.

The above remarks will confirm the good opinions previously expressed regarding the New Hudson lightweight, a motor cycle which we have every confidence in recommending as a staunch and reliable mount.

## RIMS AND TYRES.

THE Rom Tyre and Rubber Co., Ltd., call attention to a matter of considerable importance to motor cyclists, and one that may be the cause of a good deal of dissatisfaction. With the advance of sidecar requirements, a good many makers are fitting motor cycles with rims to take

Fig. 1.

A 650 by 65 mm. voiturette tyre on a voiturette rim; beads filling the clinch perfectly, and, consequently, chafing does not take place.

Fig. 2.

A motor cycle tyre 26 by 3 or 26 by 2 1/2 in. on a voiturette rim. Beads fill the clinch insufficiently, hence movement takes place, and the walls of tyre are chafed through.

voiturette tyres, and obviously such rims are totally unsuited for motor cycle sizes of covers, as a comparison of the accompanying sketches will show. The bead of a motor cycle cover, if fitted into a voiturette rim, will obviously be worn away in a very little time, owing to its not filling the clinch of the rim and having space in which to work about. A 26 in. by 3 in. tyre that the Rom Co. recently brought out, for riders who require heavy work from their tyres but were already tied down to the motor cycle size of rims, is, owing to its size, still more likely to be subjected to the same unfair usage, and it should be made quite clear that these tyres,

Fig. 3.

A motor cycle tyre 26 by 3 or 26 by 2 1/2 in. on a motor cycle rim. Beads fill the clinch perfectly.

which, though large, were made specially to fit motor cycle rims, should on no account be used on voiturette rims. If riders have wheels with voiturette rims they should fit them with 650 x 65 mm. or 700 x 80 mm. voiturette covers, otherwise they are certain to have trouble. Similarly it will be readily understood that on no account must riders attempt to fit voiturette tyres to motor cycle rims. To fit either pattern of tyre to unsuitable rims is simply asking for trouble, and the rider is sure to get it.

H. Reed (D-t-Jap), winner of *The Motor Cycle Cup* in the handicap at the R.A.C. Gala Day at Brooklands.

# BEST AFTER TESTS

"THE PULLMAN CAR OF MOTOR CYCLES."

IN the recently held Reliability Trial promoted by the Streatham and District M.C.C., Mr. W. L. Barratt, riding a BAT, won the JULIAN ORDE CHALLENGE CUP.

This same handsome trophy was also won in 1911 by a BAT rider, a remarkable record, and a striking tribute to its consistent running.

## REVOLUTION IN CARBURETTORS

GENTLEMEN,  
I ASK YOU TO  
CONSIDER WHAT IS  
WRITTEN BELOW.  
IT MUST COUNT.

Mr. Smith, on T.T. Triumph,  
Manchester Wednesday Hill  
Climb, won on Formula and  
Fastest Time.

Mr. K. C. Clark, on 3½ h.p. Corah,  
with Binks, "Fastest Time in 500  
Class; also in All Comers, tied for  
Fastest Time with 8 h.p. Overhead-  
Jap at Warwickshire Auto Club  
Annual Hill Climb.

Thos. Clayton & Sons, the well-known  
Birmingham Firm, write, saying:  
"More than delighted with it on T.T.  
Bradbury."

Edwards, the well-known actor, had a  
Binks fitted by his agents, Messrs.  
Chilton & Co., on his Bradbury on  
his arrival in London. Wired to  
them: "God bless Binks."

A. Beaumont, Esq., writes; "Never  
appreciated my Matchless till I had  
a Binks fitted."

Rev. C. E. Palmer, Nuneaton, writes:  
Far beyond anything in pre-Binks  
days."

Mr. C. E. Robbins, the well-known rider,  
writes: "I ran third in the great London-  
to-Edinburgh and back Run, and won  
Gold Medal, and also won the SILVER  
CUP in the N.W. London Club's Run to  
Coventry and back on Binks."

I could fill pages with similar testimonials.

DO NOT BE MISLED, THE 2-JET BINKS  
is the only carburettor to give fast and slow  
running, a tick round, and instant start.

PRICE 45/-

With 6 spare jets, 2 keys, and  
handle-bar control.

EXPERIENCE

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Presentation to Mr. F. Straight.

Sir.—Please accept my sincere thanks for the handsome illuminated address which you have kindly forwarded to me. I can assure you that I greatly appreciate the kind sentiments expressed thereon, but feel that any assistance I may have been able to render to the motor cycle pastime and industry during my term of office as secretary of the Auto Cycle Union has been amply repaid me by the number of friendships that I have made during that time.

I am glad to say that I shall still be connected with the industry, and consequently able to remain in touch with those friends. The address will, however, always remind me of my ten years of office and of my very pleasant connection with the motor cycle pastime and industry.

F. STRAIGHT.

#### A Flag of Distress.

Sir.—It is very pleasing in these days of supposed extreme selfishness to see on the road the spirit of *camaraderie* which motor cyclists so often exhibit. If a motor cyclist be held up on the roadside, it is a most unusual experience to find another motor cyclist who does not slow down or actually stop to offer assistance. It may be that the "held-up" one is merely shortening the belt (motor cycles in these days have attained such a state of perfection that rarely do they require mechanical adjustment on the road); anyhow the rider rarely has occasion to ask for assistance. Now, if a motor cyclist is held up for ten minutes on the road, particularly a busy road, it is more than likely that a large number of motor cyclists will slow down or stop, and, as often happens, unnecessarily.

Could not some badge be arranged to prevent this unnecessary delay to others? A small flag might be exhibited which would indicate "assistance required." HELP.

#### Cyclecars.

Sir.—As an old reader of your esteemed journal, will you allow me to make a few remarks on the question of the cyclecar? "Ubique's" article in last week's number gives all points clearly that are difficult to overcome, but are they really so hard to surmount? A few days ago I had a chat with M. Médinger, whose cycle racer you depict in a recent issue. M. Médinger does not seem to think that the chief point, *i.e.*, the price, ought to be a difficulty at all. He has a good ten years' work behind him on small cars, and especially what you call here in England the cyclecar. This type he has been developing for the Austrian race track for a good while, and when M. Médinger came this year to England he was surprised to find that the cyclecar is so far behindhand considering the splendid roads we have got here. M. Médinger, who is coming out with the Médinger cyclecar shortly, does affirm that for the light type of car destined to replace the sidecar combination a differential and reverse can easily be dispensed with. M. Médinger has done touring and racing in Austria, Italy, France, and Germany, and here in England, and speaks from practical experience. But again, M. Médinger admits that we have further to overcome vibration trouble, and as a *sub rosa* remark I may say that the Médinger cyclecar is to have a new departure of valveless engine with a to be patented design of carburation to eliminate this trouble of vibration.

It is hoped the first tests of the new type "M.C.C." will be made in September if *force majeure* is not stepping in, and to make matters still more interesting for the English motor cyclist it is hoped that M. Robert Médinger, the Austrian

motor cycle record breaker and holder of Alpine track (Semmering) record, will establish the new cyclecar records on track and road with the Médinger cyclecar.

Not to intrude further on your valuable space, I will only add that I am at present no further interested in M. Médinger but as a countryman and an anxious worker for the proper cyclecar.

AN AUSTRIAN.

#### Punctures.

Sir.—May I be allowed a few lines wherein to record my personal experience *re* above, in reply to "Verator's" enquiry?

About a year ago I took delivery of a new mount and had the misfortune in one of the first rides thereon to suffer from twenty-three punctures! This was certainly over some exceptionally bad secondary roads, but, nevertheless, most annoying. Just about the same period the "Firmax" people were offering sets of their well-known compound at reduced prices as (I presume) an advertisement, and out of sheer desperation I was tempted to invest in one! Although a keen motorist of many years standing, I had never believed in these puncture preventive measures, but after a thoroughly extensive trial of "Firmax," am now quite convinced that it actually does what the makers claim, provided always that their instructions are carefully carried out in first instance. As a latest example of its use, I may mention that on my return journey from a recent short tour round the Lake District I picked up a hob-nail in sidecar tyre, piercing the tread and inner tube to the head. This was discovered firmly embedded in the rubber when some thirty miles from home, and although it was then pulled out, the tyre did not appreciably become deflated for several hours (despite a twelve stone passenger and heavy luggage in sidecar), and I was able to reach my destination without stopping at all.

This is only one of many somewhat similar experiences during the year, and it is a real comfort always to get "there and back" without tyre troubles nowadays! I must, in conclusion, add the usual disclaimer; I am not in any way directly or indirectly acquainted with or financially interested in the firm.

F. J. KELSHAW CONWAY.

A rotary engine motor cycle built by the Gyroscopic Motor Synd., Ltd. The photograph shows the engine revolving at a speed of 4,000 r.p.m., but it will be noted that, although the photograph has been taken by timed exposure, the outline of the machine is very clearly defined, which is a good demonstration that the engine is practically vibrationless.

### Automatic Carburetters and Twin Engines.

Sir,—I have recently fitted a Binks two-jet carburetter to my 6 h.p. twin Rex, and noticing a letter in last week's issue on this subject, I should like to give you my experience. The carburetter fulfils all the conditions mentioned by "Socrates." The flexibility of the engine is increased in a marked degree, and I now run through all traffic on a  $3\frac{1}{2}$  to 1 gear; previously I had to use the low.

The engine picks up quickly and without jerk after slowing down. The velocity of the air past the small jet is high at slow speeds, and a small charge of good gas is taken into the cylinder, consequently there is no misfiring. The machine runs from 25 to 30 m.p.h. on the flat on small jet alone, and the large jet is only used on stiff hills.

My consumption at ordinary touring speeds on average roads is about 70 m.p.g. I carefully checked my last run of sixty-five miles, and the consumption worked out at 73 m.p.g.

FRANK HALL.

### Combined Chain and Belt Drives.

Sir,—"Ixon" in an issue of *The Motor Cycle* recently claims to have done much to popularise the combined drive. Be this as it may, it has taken him six or seven years to come to the conclusion that the speed gear is a necessity on a touring machine. Even to-day he has got the "hang" of the full chain drive.

Personally, I favour the combined drive from the simple fact that it is a decided step towards the chain drive and its adoption, and its winning the Junior T.T. will do a very great good in exploding some of the "popular" fallacies regarding the chain drive.

Looking into the advantages of the combined drive over the direct drive, we get with the former a short high speed chain drive to a counter-shaft, thus being enabled to use a larger "small" pulley for the belt drive. This belt drive in consequence becomes more durable, and less likely to belt slip—two very desirable points of advantage. We are assured by riders of this drive that it is perfectly satisfactory. For years motor cyclists have been taught by the press that the belt drive is best; now the press is going out to teach the motor cyclist that the combined drive is better than the belt—that by introducing the weakest half of the much abused chain drive we are getting a better drive. This I thoroughly uphold from my own experience of various forms of drive. In use the combined drive adds one hundred per cent. to the life of the belt; we have this on good authority from many riders of this drive. It also reduces the worry from belt slip. This result is gained by the adoption of the weakest half of the chain drive—the high speed front chain. This is a point I want motor cyclists to understand; hence its repetition. In fact, the chain is given the first and hardest part of the driving stresses to transmit, whilst the belt is left off with a comparatively light part to do. Even then the much abused chain wears longer than the belt, and gives less trouble on the way. This being a fact, I fail to see the object of retaining the belt at all; why not have the back chain of the chain drive as well? The back chain gives less trouble than the front chain, and generally lasts for about 12,000 to 15,000 miles.

Designers are aiming at a belt drive that does not slip and has long life. There have been great improvements in belts and pulleys, and now by the introduction of the chain to help them out these aims have nearly been accomplished, but we still do get belt slip and belt adjustments to do on the road. Directly the makers do attain these perfections in their belt drives, they will only have attained the points of superiority that the correctly designed chain drive, as brought out nine or ten years ago by Messrs. Phelon and Moore, has held out to them for all this time. What is there in the belt itself that makes it so beloved of the average motor cyclist? Want of experience with chain drive, I think.

For those who do not know what a correctly designed chain drive should be, I may say that the important points in such a drive are that it should have an independently adjustable slip clutch in addition to the clutch or clutches necessary for a speed gear if fitted; that the chains should not be long enough between centres to allow excessive side swing; and that easy adjustment should be provided. The P. and M., Enfield, and A.J.S. are chain drives which satisfy these conditions. There are many other chain drives on the market besides these at present, but which

do not have slip clutches fitted, and these latter are only too likely to make the chain drive harsh. It is not an absolute necessity to have the chains covered, but only an advantage, and if they are covered the covers should be absolutely oil and dust-tight, otherwise the chains are better left uncovered altogether.

The first cost has more to do with the popularity of belt drive than whether it is the best drive. T. F. MAW.

### Running on Paraffin.

Sir,—I should like to give your readers the benefit of my experience of running on paraffin. The following experiments were conducted on a 3 h.p. Triumph, with a 1911 B. and B. carburetter and 32 jet. The first fuel tried was White Rose oil, flash point 105° F. The tank was emptied of petrol and filled with this oil, the top of the float chamber was unscrewed and filled with petrol, and the paraffin tap turned on. The engine started up easily, and, after running about half a mile, I thought it would stop, but no, it kept going merrily on the paraffin, so I tried a few hills. I found that I obtained slightly less power and that the engine would not run so fast as on petrol, and the exhaust was slightly smoky. However, I ran for two months on White Rose, cleaning the cylinder and piston every hundred miles. I also found that the engine would not restart on this paraffin unless the engine was very hot. During a short run the engine got very hot indeed and special air-cooled oil had to be used, and advantage had to be taken of cooling the engine on every down grade, but with all these precautions the engine played the blacksmith's tune on steep hills, which could not be rushed. To start from cold by filling the carburetter with petrol was a troublesome and dirty task, so I rigged up a petrol tank underneath the seat, communicating with the carburetter by means of a cock and a one-eighth inch copper tube. A one-eighth inch hole was drilled in the spraying chamber just above the choke tube, and the copper pipe was pushed through the hole until its end was vertically above the hole in the jet. To start the machine from cold, the petrol cock was turned on and adjusted until petrol dropped slowly from the bottom air funnel; the engine then started at a walking pace, and after running three-quarters of a mile the paraffin could be turned on and the petrol off. If the paraffin was turned on before the engine was really hot thick clouds of smoke came from the exhaust.

My last experiment was conducted with Royal Daylight paraffin, flash point 81° F., specific gravity .797, and heating value 20,100 B.T.U. per lb., price 8d. per gallon. With this I found that I could switch over from cold after covering 300 yards on petrol. The machine climbed hills better, the exhaust was smokeless at all times, and there was no sign of knock on hills, while the engine ran about 96 miles per gallon, and it was as fast as on petrol.

VULCAN.

G. S. Hull (3 1/2 h.p. Scale-Jap) ready to start in the Sheffield and Hallamshire M.C.C. hill-climb.

# ENGLISH =DUTCH

# INTERNATIONAL RELIABILITY TRIAL

## VICTORY OF THE DUTCH TEAM BY 35 POINTS.

**M**AINLY by reason of the fact that in England the motor cycle is much more popular than in any other country, international contests have not appeared as leading events on our yearly fixture lists. Though England was always willing to fall in with any suggestion of international competition, no international reliability trial had hitherto been arranged. The English-Dutch trial was the outcome of a visit to the Isle of Man last year for the T.T. Races of a party of members of the Dutch Motor Cycle Club.

Immediately the idea of an international contest was broached by the sporting secretary of that body, Mr. A. Citroen, of Amsterdam, it was taken up with enthusiasm on this side, and last November matters began to take definite shape. The rules were formulated by the Dutch Motor Cycle Club, and *The Motor Cycle* was invited by the officials of that body to receive entries from British riders, which we agreed to do—though taking no part in the organisation of the trial—and soon so many entries were received that a process of elimination became necessary.

Eventually it was resolved to appeal to committees of leading motor cycle clubs to aid in the selection, and representative teams were chosen by this means. In brief, the chief rules of the contest were as follows: Genuine touring machines to be used by all, completely equipped for the road. Eighteen riders to represent each country, composed of nine private owners and nine trade men. Each team to be divided into three lightweights, three mediumweights, and three heavyweights, with or without sidecar attachments. Conditions, a non-stop run at 19 m.p.h. Entry fees: Trade riders, £1; private owners, 5s. As it was neces-

sary for each team to appoint reserve men in case of any untoward incident preventing a team man from starting, medals were offered to all reserve riders who covered the 158½ miles course without a stop and within schedule time.

Vernon Taylor (3½ h.p. Rudge), private owner.

### A Strong Trade Team.

The trial has been eagerly looked forward to for weeks past. The English trade section were very confident of success, and a glance at the list will show that practically all the leading reliability

trials riders had been voted to a place in the team. The amateur section was not quite so strong, for various reasons.

Unfortunately, Holland being so flat the trial could not be made a strenuous one, and our Dutch friends were evidently anxious to ensure that the trip be made enjoyable to their English guests, for, instead of split seconds timing at controls, fifteen minutes' latitude was allowed.

W. Cooper (3½ h.p. Bradbury), captain of the private owners' team.

### Programme of the Trip.

In connection with the visit, the Dutch Club officials thoughtfully arranged an attractive programme for the English team, and the official handbook, illustrated with photographs of the officials, and printed in Dutch and English, will be preserved by the British participants in commemoration of the occasion.

The English teams and reserves assembled at Harwich last Saturday evening, where they had been requested to report themselves to the respective captains, Messrs. Cooper and Pratt, before six o'clock. Most had travelled down

Geoffrey Smith (2½ h.p. Humber), private owner.

W. F. Newsome (3½ h.p. Triumph), trade.

from town, the whole of the arrangements having been made by Mr. H. Moroney, of the Royal Automobile Club Touring Department. A goodly number of non-competitors journeyed with the party.

In the early hours of Sunday, the boat reached the Hook, and here we found Messrs. Citroen (hon. sec.), Robt. R. toe Laer (president), and J. Ferwerda (committee) to welcome the party. After breakfast in the Hotel America, a visit was made by motor cycle to the Hague and Scheveningen, the noted bathing place, the "Keep to the right" rule troubling the riders not a little. An official dinner had been arranged for the evening in Amsterdam, the machines having previously been examined and locked up for the morrow.

#### The Course.

The 158 1/2 miles course is shown on the accompanying map, checks being arranged at Soestdyk, Apeldoorn (luncheon stop), De Steeg, De Grebbe, Utrecht, and Amsterdam. The penalty for an involuntary stop was three marks,

Reg Holloway (2 1/2 Premier) trade team.

F. W. Barnes and passenger (6 h.p. Zenith), trade.

S. Wright (2 1/2 h.p. Humber) trade.

and one mark was deducted for every minute early or late at controls. In case of any competitor not finishing within schedule time, fifty marks were to be deducted.

#### The International Trial.

Competitors met at 7.0 a.m. at the Darracq Palace, Stadhonderskade, where armlets were issued and tanks replenished. The British machines had green circular number plates with the letter E before the number, and the Dutch machines H.

At eight o'clock, in the presence of a big crowd, the first trio was despatched by Mr. Citroen, followed by the remainder at minute intervals as follows:

F. A. Applebee and O. C. Godfrey (3 1/2 h.p. Scott Sidecar), trade.

- H. 1 N. Ruyter (1-cyl.  $3\frac{1}{2}$  N.S.U.)  
 E. 2 Geoffrey Smith (2-cyl.  $2\frac{3}{4}$  Humber)  
 H. 3 H. Dieters (2-cyl. 6 Phaunomobil)  
 E. 4 W. W. Douglas (2-cyl.  $2\frac{3}{4}$  Douglas)  
 H. 5 Hugo Smit (1-cyl.  $3\frac{1}{2}$  N.S.U.)  
 E. 6 Frank Smith (2-cyl. 5-6 Clyno)  
 H. 7 E. J. E. Maas (4-cyl. 5-6 F.N.)  
 E. 8. C. M. Down (2-cyl.  $2\frac{3}{4}$  Royal Enfield)  
 H. 9 D. Croll, jun. (2-cyl. 7 Indian)  
 E. 10 R. Holloway (1-cyl.  $2\frac{1}{2}$  Premier)  
 H. 11 P. J. Adrian (1-cyl.  $3\frac{1}{2}$  Eysink)  
 E. 12 F. W. Barnes (2-cyl. 6 Zenith)  
 H. 13 P. N. Jelsma (1-cyl.  $2\frac{3}{4}$  Eysink)  
 E. 14 A. E. Uffleman (2-cyl. 6 Rex-Jap)  
 H. 15 D. de Roon (4-cyl. 5-6 F.N.)  
 E. 16 Sam Wright (2-cyl.  $2\frac{3}{4}$  Humber)  
 H. 17 R. S. Stokvis (1-cyl.  $3\frac{1}{2}$  Rover)  
 E. 18 F. A. Applebee (2-cyl.  $3\frac{1}{2}$  Scott)  
 H. 19 Jacq Fonck (1-cyl. 2 Vulkaan)  
 E. 20 W. P. Newsome (1-cyl.  $3\frac{1}{2}$  Triumph)  
 H. 21 J. L. Geidt (2-cyl. 6 Cyclonette)  
 E. 22 Vernon Taylor (1-cyl.  $3\frac{1}{2}$  Rudge)  
 H. 23 G. Th. Arends (1-cyl. 2 Vulkaan)  
 E. 24 W. Cooper (1-cyl.  $3\frac{1}{2}$  Bradbury)  
 H. 25 Dirk v. d. Mark (1-cyl.  $2\frac{3}{4}$  F.N.)  
 E. 26 W. Pratt (1-cyl.  $3\frac{1}{2}$  Phelon and Moore)  
 H. 27 J. W. Boots (2-cyl. 6 Coronamobil)

 H. 35 H. Daalmeyer (2-cyl. 6 Cyclonette)  
 E. 36 E. Lester (1-cyl.  $3\frac{1}{2}$  Phelon and Moore)  
 H = Holland, E = England.

W. Pratt ( $3\frac{1}{2}$  h.p. P. & M.) trade.**A Dutch Victory.**

The contest resulted in a handsome victory for the Dutch team, who lost 28 marks as compared with the English team's loss of 63 marks. F. C. Wasley, who early experienced trouble with his magneto and missed one check in consequence, lost 43 marks of the total English loss. The trial was rendered difficult by atrocious roads, but the organisation was excellent. The Dutchmen rode consistently, and caused some surprise among the English competitors, who hardly expected to find their opponents so diffi-

cult to wrestle with. The weather was fortunately, fine, and big crowds in the towns passed through witnessed the contest and cheered the riders on.

Of the British team non-stop runs were made by the undermentioned:

Fred Dover ( $3\frac{1}{2}$  Premier) private owner.**PRIVATE OWNERS.**

Geoffrey Smith ( $2\frac{3}{4}$  Humber)  
 W. Cooper ( $3\frac{1}{2}$  Bradbury)  
 Fred Dover ( $3\frac{1}{2}$  Premier)  
 C. W. Wilson (8 Morgan Runabout)  
 E. Lester ( $3\frac{1}{2}$  P. and M.)

**TRADE RIDERS.**

W. W. Douglas ( $2\frac{3}{4}$  Douglas)  
 Frank Smith (5-6 Clyno sc.)  
 Sam Wright ( $2\frac{3}{4}$  Humber)  
 W. F. Newsome ( $3\frac{1}{2}$  Triumph)  
 W. Pratt ( $3\frac{1}{2}$  P. and M.)  
 F. W. Barnes (6 Zenith sc.)  
 J. Slaughter ( $3\frac{1}{2}$  New Hudson)  
 F. A. Applebee ( $3\frac{1}{2}$  Scott sc., C. G. Godfrey passenger)

Further details will appear in our next issue. It was arranged that Tuesday be spent at Volendam and Marken, Wednesday at the Hague, the return journey being commenced at eleven o'clock that evening.

W. W. Douglas ( $2\frac{3}{4}$  Douglas) trade.J. Slaughter ( $3\frac{1}{2}$  h.p. New Hudson) trade.F. C. Wasley ( $2\frac{3}{4}$  Douglas) trade.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Aug. 8th	...	8.35 p.m.
" 10th	...	8.31 "
" 12th	...	8.28 "
" 14th	...	8.24 "

## The Institution of Automobile Engineers

Some very interesting papers will be read at the meetings to be held during the autumn. The paper on "Motor Cycles" by Mr. W. Chater-Lea, and that on "Two-cycle Engines" by Mr. Dugald Clerk, F.R.S., should be particularly interesting to motor cyclists.

## A Favourable Report.

Frank Smith reports very favourably upon the 1913 model Clyno three-speed gear box he used in the Scottish six days' trial. Dismantling it for inspection after trial, it was found to be in perfect condition, and consequently it was put together again for the Dutch trial and the A.C.U. six days' trial.

## A New Light Norton

The 2½ h.p. Norton ridden by F. A. Hardy, a reserve rider in the Dutch trial, is an advanced model of the machine the Norton Manufacturing Co. will market next year. The engine measures 67 x 85 mm. The first machine was hastily assembled for the English-Dutch trial, but the standard model will be lighter, shorter in wheelbase, and in other ways improved.

## Military Motor Cyclists.

A new cyclist battalion is in process of formation for the County of Warwickshire of which, we understand, Colonel W. R. Ludlow will be the honorary colonel. The battalion will be commanded by Colonel Arthur Du Cros, M.P., whose idea is to have a battalion entirely composed of motor cyclists. This has the warm approval of the Secretary of State for War.

Letters should be addressed to Colonel Arthur DuCros, M.P., 4, Regent Street, London W.

## The Triumph Counter-shaft Gear.

The new Triumph three-speed counter-shaft gear is expected to make its first official appearance in the Six Days' Trials, though there was a doubt last week-end whether it would be completed in time. J. R. Haswell (who has had the confidence to enter a 3½ h.p. passenger machine in such a severe trial) and W. F. Newsome are expected to use it. Both are to use Sturmey Archer gears if the new Triumph is not completed in time. The new Triumph automatic carburettor will appear on several machines of that make. H. Lister Cooper will, it is said, ride a fixed gear Triumph.

## FUTURE EVENTS

- Aug. 12-17.—A.C.U. SIX DAYS' TRIALS. Taunton as a centre.
- " 31.—Coventry and Warwickshire M.C. Open Hill-climb.
- " 31.—Dublin M.C.C. Open Sidecar Reliability Trial.
- Sept. 7.—Steeatham and District Open Hill-climb.
- " 7.—Liverpool M.C.C. Open Reliability Trial.
- " 14.—B.M.C.C.C. Race Meeting.
- " 16.—Edinburgh and District M.C.C. Open Hill-climb on Amulree.
- " 21.—Herts. County M.C.C. Open Hill-climb.
- " 21.—Birmingham M.C.C. 24 Hours' Run to Edinburgh (Open)

## A Guide to the Six Days' Trials.

This issue contains reproductions from the official maps, also a timetable showing the time the competitors are due at different points on the course, and a complete list of entrants with their armlet numbers. Readers in the West country will consequently find this issue a particularly useful guide in identifying the riders and following the trials next week.

## Scottish Six Days' Trials.

In the results of the above trials published last week, it was stated that G. Taylor (Rudge) lost 91 marks, and gained a bronze medal. The officials have since discovered that this was an error, and have awarded Taylor a silver medal, he having lost 60 marks only. Hugh Gibson was disqualified; it will be remembered that this rider's award remained undecided last week. No reasons are given for the disqualification. Frank Smith (Clyno sc.) claims a clean ascent of Kenmore Hill, and points out that his sidecar was the only one to climb the hill without a stop. C. M. Keiller's G.W.K. also made a non-stop climb.

F. A. Hardy (2½ h.p. Norton Lightweight) who went to Holland as a reserve in the English-Dutch Trial.

## SPECIAL FEATURES.

### ENGLISH-DUTCH INTERNATIONAL TRIAL

#### A.C.U. SIX DAYS' TRIALS.

Official Maps, Contours, Daily Routes, and Entries.

### A Record Entry for the Six Days' Trials.

There is a record entry for the Six Days' Trial, which commences next Monday. The A.C.U. officials will have an extremely difficult task to handle more than 120 competitors. Great interest in the trial is being taken in Devonshire and Somerset, and it is expected that large crowds will line the route. Motor cycle trials are few and far between in the West country.

### A Triumph Desaxe Engine.

For some weeks past the Triumph Cycle Co., Ltd., have been experimenting with a 3½ h.p. engine with offset cylinder. In other respects the engine is standard. F. Hulbert is now using the new engine in his own machine, but he told us last week that he could detect little or no improvement from the change, and there was no likelihood at present of it being adopted for 1913.

### The A.C.F. and the Motor Cycle.

The Automobile Club of France, like the R.A.C. in Great Britain, is the governing body of all phases of motoring in that country, and it has at last decided to take an interest in the motor cycle. Its Competitions Committee will hold a 1,500 kilometres trial (approximately 930 miles) from October 7th to 12th. The course will radiate from Paris, and for the first five days will be 270 kilometres per diem, and for the sixth day 150 kilometres. The motor cycles will probably be stored at Neuilly. Every machine will have to be in touring trim, fully equipped for the road. The classes will be as follow:

CLASS 1 (motor bicycles).—A. Single-cylinders up to 250 c.c., minimum weight 40 kgs. without oil and petrol, tyre section limit 45 mm. B. Single or multi-cylinders up to 350 c.c., minimum weight 50 kgs., minimum tyre section 45 mm. C. Singles or multis up to 500 c.c., minimum weight 60 kgs., minimum tyre section 50 mm.

CLASS 2 (passenger machines).—A. Single or multi-cylinders up to 350 c.c. B. Single or multi-cylinders up to 500 c.c. C. Single or multi-cylinders up to 1,000 c.c. A clutch and change-speed gear must be fitted to all passenger machines.

A valuable cup will be presented to the competitor losing the least number of marks, and medals to others performing satisfactorily.

**Registration Letters.**

The new registration letters for Birmingham are O.A.

**Stolen Machine.**

A 1911 2 h.p. Singer was stolen on the 2nd inst. from Reading. The machine number is 254250. The front wheel has an old Dunlop studded tyre and back wheel new Palmer studded. Watawata belt, special footrests with ordinary cycle pedals. A reward is offered by T. Baker and Sons, Friar Street, Reading.

**Lady Motor Cyclists.**

One does not often meet De Dion type tricycles on the road nowadays, and still less seldom are ladies seen on this old pattern machine, but we saw a smart lady motor cyclist last week at Leominster riding a motor tricycle, behind which was a trailer containing one or more children.

**Imitating the Aeroplane.**

The latest use for the motor cycle is to provide the noise made by an aeroplane at a theatrical performance. The aeroplane is heard "off" and the motor cycles, two Douglas twins, with open exhausts, are started upon the stand to imitate the exhaust of a whirling Gnome engine. The result is quite realistic.

**Grand Prix de France.**

The route for the Grand Prix de France, August 25th, is as follows: Fontainebleau, Arbonne, Achères, Ury, Fontainebleau. This circuit measures thirty kilometres and will have to be covered fifteen times by motor bicycles, and twelve times by sidecars in the maximum time of twelve hours, or at an average speed of 23.3 miles per hour for motor bicycles and 18.7 miles per hour for sidecars.

**Racing in the Antipodes.**

Some exciting racing was witnessed at the flying mile championship of the New South Wales M.C.C. on the Ascot race-course at Botany Bay. There was so large an entry that the championship had to be run off in heats. J. E. Yee (3½ h.p. Triumph) made the fastest heat time in 4 mins. 32½ secs., but he could only finish second in the final, first place going to A. Robinson, in 4 mins. 26½ secs. Robinson also won the handicap held in conjunction with the championship from scratch, Yee, also at scratch, being third.

**A Strange Advertisement.**

The following advertisement was published in a recent issue of *The Irish Times* in the "Motors for Sale and Wanted" column:

FRANCOIS 2½ h.p. 1912, San Salvador's contribution to the Motor Cycle Trade; "Turnover" rims, magneto governor, Protean gear, live axle, gasoline cap four gals., wind cooled, interruption on handle-bar; wonderful climber; quite unique.

Our knowledge of the industry does not enable us to state definitely where the machine hails from, but we should be very interested to know what San Salvador's contribution to the motor cycle trade is. The Protean gear is also unknown to us in connection with motor cycles.

**Petrol Consumption.**

The results of the petrol consumption test which recently took place at Southland, New Zealand, were: 1, J. Davies (3½ B.S.A.); 2, A. Prentice (3½ B.S.A.); 3, E. Gray (3½ B.S.A.). A large number of competitors took part mounted on various other makes.

**Speed Limit Applications.**

Two speed limit applications are now under consideration by the L.G.B. They are relating to certain lengths of road in Wanstead (Essex) and Sutton Coldfield (Warwickshire). Both applications are opposed by the R.A.C. and the A.A. and M.U. and local organisations.

**Italian Road Race.**

An Italian motor cycle race was held on the 28th ult., at Milan, over a 314 kilometres out and home course. The following are the winners of the respective classes: Class I., 250 c.c., Cremaschi (Moto Réve), 7h. 44m. 48s.; Class II., 333 c.c., Gnesa (Buchet), 5h. 46m. 22½s.; Class III., 500 c.c., Vailati (Rudge), 5h. 8m. 7½s.; Class IV., multis, 500 c.c., Ghirlanda (N.S.U.), 5h. 22m. 14½s. Fastest time, Vailati (Rudge) = 61 kilometres per hour.

**French International Cup Race.**

For the international race to be held on the Le Mans Circuit on September 8th and 9th, the motor cycle course will be considerably shorter than the car course. Starting from Le Mans, motor cyclists will travel along the *route nationale* until just before the junction of roads at Mulsanne. Here is a sharp left-hand turn, and then the road passes through Ruandin and back to Le Mans. An alteration has been made in the regulations which enables cyclecars with a cylinder volume not exceeding 1,000 c.c. to take part in Class III.

**Additional Entries Six Days' Trials.**

P. J. Evans (2½ Humber), A. J. Dixon (3½ Singer), Miss Hammett (2½ Douglas).

**Belgian Motor Cycle Race.**

On the 25th inst. a race will be organised by the Motor Club of the Littoral and of West Flanders, under the patronage of the A.C. of Ostend. The competition will be over a course 200 kilometres in extent. Further information may be obtained from the secretary, 29, Avenue Leopold, Middelkerke, Belgium.

**Road Making in the North American Continent.**

Mr. W. Rees Jeffreys, secretary to the Road Board, has just returned from a visit to the United States and Canada to secure the attendance of the principal American and Canadian road engineers at the International Road Congress to be held next year in London, and to enquire as to the state of the roads in the two countries. During a talk we had with Mr. Jeffreys, he told us that things were really moving in the States as far as roads were concerned, and that a few years hence there would be concrete evidence of the result of the "good roads movement." Good roads did exist in Massachusetts, and in certain big towns, and especially in the city parks, but roads as connecting links between the great cities were practically non-existent. People, however, were keenly alive as to the necessity of good roads. Owing to the political system good roads were made, and then, owing to frequent changes of officials, were often allowed to be worn out to a quagmire. Canada was far behind the States as regards roads, but showed signs of waking up. Mr. Jeffreys, who was a motor cyclist in the early days, told us that he saw very few motor bicycles over there, but numberless cars.

English-Dutch Trial. Competitors wheeling their machines off the harbour station platform, Harwich.

## MERSEY M.C. OPEN CLIMB AT PEN-Y-BALL.

A busy scene in the enclosure before the start.

THE Mersey M.C. held a successful competition at Pen-y-Ball, Holywell, on the 3rd inst., which took the form of an open flexibility hill-climb. The formula used was F—S (where F = fast speed in m.p.h., and S = slow speed, largest figure wins).

## CLASS 1 (up to 350 c.c.)

	Formula.	Time.
F. Whitworth (2½ Douglas) ...	1	2
E. J. Jenkins (2½ Douglas) ...	2	5
E. J. Moon (2½ Douglas) ...	3	4

Fastest time was made by S. W. Philippott (2½ h.p. Humber). F. A. McNab (2½ h.p. Douglas) broke his belt, and A. J. Jenkins (2½ h.p. Douglas) blew out a plug.

## CLASS 5 (Sidecars and Cyclecars).

	Formula.	Time.
A. J. Brewin (8 Zenith-Gradua sc.) ...	1	1
N. Brown (7 Indian sc.) ...	2	4
H. W. Coopland (8 Williamson sc.) ...	3	5

E. Longden (8 h.p. Dot sc.) carried a dog as well as passenger, but the only adult passenger was Mrs. Baxter, who went up in the Williamson; the other competitors carried local children.

## CLASS 2 (351 to 600 c.c.).

	Formula.	Time.
P. Prond (3½ Rudge multi.) ...	1	5
H. Bottoms (3½ Triumph) ...	2	3
H. D. Ashworth (3½ Triumph) ...	3	2

The fastest time was made by T. Pollock (3½ h.p. James), who failed in the slow climb. S. W. Philippott (3½ h.p. Humber) had chosen a low gear, and though he lost ground in the fast climb, he came up so slowly afterwards that he had difficulty in steering.

## CLASS 3 (601 to 1,000 c.c.).

	Formula.	Time.
A. J. Brewin (8 Zenith-Gradua) ...	1	5
N. Brown (7 Indian) ...	2	3
J. J. Cookson (7 Matchless) ...	3	2

H. Reed (8 h.p. Dot) made fastest time, but did not attempt the slow climb.

N. Brown (Indian and sidecar) nearing the top of the hill.

## Mersey M.C. Open Hill-climb at Pen-y-Ball.—

CLASS 4 (unlimited).

	Formula.	Time.
N. Brown (7 Indian) ... ..	... 1 ...	5
J. H. Roscoe (5 Victoria-Peugeot) ... ..	... 2 ...	6
E. F. Baxter (6 Rex) ... ..	... 3 ...	4

As in Class 3, H. Reed rode only in the fast climb, and made the fastest ascent.

The weather was fine until Class 3 was being run, when a drizzle began, which continued till the end. There was a large number of spectators. The thanks of the club are due to the police authorities and the Urban District Council. In spite of the silencer rule, many machines had the ends of the silencers removed and were very noisy.

The object of this competition was to prove that the petrol engine is a flexible prime mover when properly driven.

## M.C.C. HILL-CLIMB AND BRAKE TEST.

THE above annual event was run off on Saturday and Monday last. The conditions were quite simple, and were really a test of the machine rather than of the rider. The course started from the Bear at Hungerford, on the Bath Road, to Devizes, Radstock, Wells, Bridgewater, Minehead (lunch), Porlock (hill-climb), Countisbury (brake test), Lynmouth (tea), Lynton Hill (hill-climb), Parracombe, and Barnstaple. The return journey was over the same route, with a timed hill-climb on Countisbury to

reported having burst his back tyre at Devizes and changed it. Dixon suffered a crop of troubles, punctures, silencer end dropped off, and ran out of petrol, etc. Just outside Minehead Guest broke his exhaust lifter wire.

The last ten miles into Minehead rain fell in torrents, and this made Porlock Hill practically unrideable. Kickham was reported as having seized his engine and retired near Nether Stowey. Howe skidded and fell and had a puncture near the same place. Beal was also in trouble with one cylinder missing.

## Porlock Hill-climb.

After lunch came Porlock hill-climb, and, as was anticipated, the hill was an inch or more deep in slime, with much loose stone. Times were taken from about 200 yards below the first corner to 1,360 yards up. This included both bends, and finished where the gradient eased to 1 in 12. Considering the state of the surface, it is remarkable that anyone reached the second corner in the saddle, especially considering that touching the ground with the feet put the rider out of the running for the cups. Observations on the hill were that B. J. Mariani went to the second corner in the saddle, as did Karslake, Sproston, Meredith, and Guest, who shed his passenger and then finished. Those who stopped on the first corner for various reasons were L. A. Baddeley, Gray, Popplewell (who descended and made a 'clean' ascent), R. M. Mariani, Walker, Bentley, D. S. Baddeley, and Rootes. C. T. Newsome got round the second corner, but had to stop because the front mudguard was choked up with the mud. Morgan got to the second corner, was assisted round, and finished with his passenger—a very fine performance. Dixon was the only solo rider to stop in the saddle all the way, but steadied and assisted with his feet practically all the way up.

Tippett and Charlesworth were very late and we did not observe them, but they were reported to have stopped. Kerr, da Silveira, Percival, Davis, and Howe decided to take the toll road after failing on the hill.

## Lynton Hill-climb.

Everyone then proceeded to Lynmouth for tea, and after inspecting the surface of Lynton it was decided to make the climb optional. Strange to say, nearly all made clean ascents, and these were in the order of climbing it: Kars-

Mersey M.C. Open Climb, competitors returning down hill for slow ascent.

decide winners of the cups, and a brake test on Porlock. To qualify for a cup award, a competitor had to climb all the test hills without pedalling, dismounting, or touching the ground with his feet, and make a standard performance over the rest of the course of 276 miles. A splendid entry of thirty-one was obtained, and the following started:

Rider.	machine.	and gear.	Rider.	machine.	and gear.
A. Baddeley (3½ P. & M., P. & M.)			J. H. Kerr (3½ N.S.U., N.S.U.)		
M. Mariani (3½ P. & M., P. & M.)			H. J. Beal (3 N.S.U. twin, N.S.U.)		
J. Mariani (3½ P. & M., P. & M.)			W. P. Tippett (3½ Humber, Humber)		
Karslake (3½ Rover, Armstrong)			A. da Silveira (7 Indian twin, Indian)		
Walker (3½ Rudge, Multi)			D. Popplewell (3½ Rover, S. Archer)		
T. Gray (3½ Rudge, Multi)			C. T. Newsome (3½ Rover, S. Archer)		
S. Baddeley (6 Baddeley twin, single gear)			E. Charlesworth (6 Zenith, Gradua)		
W. Meredith (3½ Bradbury, S. Archer)			C. Percival (6 Zenith, Gradua)		
E. Rootes (3½ Singer, S. Archer)			E. C. Davis (8 Chater-Lea so., Chater-Lea)		
H. Bentley (3½ W.D., Armstrong)			R. E. Guest (8 Matchless, Matchless)		
J. Sproston (3½ Rover, S. Archer)			H. F. S. Morgan (8 Morgan cycle-car, Morgan)		
J. Dixon (3½ Singer, S. Archer)			G. P. Howe (3½ Rudge, N.S.U.)		
			E. Kickham (2½ Douglas, Douglas)		

It is interesting to note that, whereas last year nine out of seventeen entrants used single-gear machines, only one out of thirty-one entrants used a single gear this year, and that there were five passenger machines entered this year as against one last year.

Messrs. F. T. Bidlake and F. Straight started the competitors promptly on Saturday from 8 a.m. onwards at one minute intervals. Incidents were few until near Radstock, when quite a number lost their way, and proceeding we stopped outside Nether Stowey to have a chat with Olsson, who was down to see his fellow members. Gray was adjusting the back wheel part of his gear and cleaning a sooted plug. Bentley had punctured, and Meredith

Mersey M.C. H. W. Coopland (water-cooled Williamson) with Mrs. Baxter in the sidecar.

**M.C.C. Hill-climb and Brake Test.—**

lake, Rootes, Morgan, Meredith, B. J. Marians, L. A. Baddeley, R. M. Marians, Popplewell, Charlesworth, Newsome, Dixon, Guest, Sproston, Davis, and Percival. Percival arrived late and was not observed. Bentley failed at his first try but made a clean ascent afterwards. Kerr and D. S. Baddeley also failed, and the latter was towed up by a waggorette. Tippet arrived late in consequence of a fall and a puncture. From Lynton to Barnstaple the going was fairly easy, but very unpleasant in consequence of torrential rain from Parracombe onwards. Of the starters from Hungerford all arrived at Barnstaple excepting Kickham and Beal, the latter having slashed a tyre and retired. On entering the garage the Morgan caught fire, and things looked lively for a few minutes. No serious damage was done. We also noticed that Howe's exhaust pipe was off and his belt rim bent. He seemed to have quite a lot of small troubles all the way.

**A Day of Rest.**

Dixon had half a dozen punctures in the last ten miles and was considerably delayed thereby. The Imperial Hotel was as comfortable as usual, and, the weather being rough and stormy, Sunday was spent mostly indoors resting.

As there was only one hill-climb on the return journey on Monday, the competitors did not start till 9.30. This was much appreciated. Everyone, excepting Bentley, who lost his way, got well on time to Lynmouth in preparation

for the timed climb on Countisbury Hill. The competitors were divided into three classes and speeds were to be judged at 12, 16 and 20 m.p.h. respectively.

**Countisbury Hill-climb.**

The running was exceedingly close, four competitors taking practically the correct time. After leaving the top of the hill B. Marians skidded in a rut and fell. This set his forks over and rendered the springs inoperative. The lamp also was badly damaged. Then on Porlock Hill, where a brake test was to be held, we met Haswell with his sidecar climbing gamely near the top. The brake test could not be run, as the surface was too greasy to be safe. We also met "F.N." Bell and several Six Days' Trial competitors out to have a look at the course of next week. The run after this was without incident, excepting that Rootes lost his way and was knocked off his machine by a horse. The machine suffered considerably, and he was rendered unconscious for some minutes. After getting his head dressed he pluckily continued and finished to time. Those to finish were: L. A. Baddeley (P. and M.), B. J. Marians (P. and M.), R. M. Marians (P. and M.), Karslake (Rover), Walker (Rudge), Gray (Rudge), D. S. Baddeley (Baddeley), Meredith (Bradbury), Rootes (Singer), Bentley (W. and D.), Sproston (Rover), Dixon (Singer), Kerr (N.S.U.), Tippet (Humber), La Silveira (Indian), Popplewell (Rover), C. T. Newsome (Rover), Charlesworth (Zenith), Percival (Zenith), Davis, (Chater-Lea sc.), Guest (Matchless sc.), Morgan (Morgan), and Howe (Rudge).

## THE EAGLE CYCLECAR.

**T**HE new Eagle cyclecar, manufactured by the Eagle Motor Manufacturing Co., Shepherd's Bush Road, W., is quite an interesting vehicle, designed on sound practical lines. The company does not intend to place the machine on the market, but to manufacture its component parts and to sell them to the trade or any private owner who cares to construct his own runabout. The motive power is an 8-10 h.p. engine, twin cylinders, 85 x 88 mm. The cylinders are set at 50°, and overhead inlet valves are fitted. An interesting feature is the double exhaust. Between the cylinders are two auxiliary exhaust ports, which exhaust into a Y tube; consequently there are three exhaust pipes running from the engine to the silencer—one from each ordinary exhaust port and another which carries the exhaust from the two auxiliary exits. The silencer is placed transversely at the end of the chassis, and the gases issue therefrom through a short fan-shaped pipe.

There is a large sump at the bottom of the crank case, so that a good quantity of oil can be retained. The cotters to the inlet valves are cone-shaped, and fit into a cone-shaped collar, so that the wearing surfaces are larger, and consequently will last much longer. The inlet valve tappets are adjustable top and bottom. The timing gear cover can be removed, leaving the timing wheels *in situ*, and to set the magneto it is only necessary to make an adjustment either on the cone of the driving sprocket, or to remove the small case which abuts on the timing gear cover, and effect the adjustment by moving the pinion enclosed therein forward or backward.

**Details of Construction.**

The first of these vehicles to be turned out has a tubular frame, but in future models the chassis will be of channel steel 1in. wide, 2in. deep, and tapered to 1in. It is narrowed in front, so as to provide an ample steering lock.

The carburettor employed is a Lukin, and the magneto a chain-driven Bosch. The clutch is of the leather to metal type, 9in. in diameter, and is provided with two ball thrust bearings, the external member having a heavy periphery, which acts as an additional flywheel.

The gear box contains three speeds forward and reverse, with direct drive on top, giving a ratio of  $4\frac{1}{2}$  to 1. The after end of the gear box takes out and the shaft may be removed bodily without dismounting the box.

The propeller-shaft has a universal joint fore and aft, the final drive being by worm. The worm drive and differential are of particularly sound design. The two brakes on the rear wheels are of the internal expanding type, and

a similar type of brake is fitted at the after end of the propeller-shaft.

The steering is by worm and sector, and all the steering rods are provided with ball joints. The control levers are carried on the steering column on a separate bracket and do not move with the wheel. These levers control the carburettor and the spark.

**A Sidecar Frame.**

Another interesting item which we inspected at the Eagle Company's Works was a new sidecar frame, the axle of which is carried on semi-elliptical springs. The body is

Front view of Eagle cyclecar showing engine and tubular frame construction:

supported on the usual C-springs and has the footboard also sprung. It is provided with a telescopic luggage carrier at the rear which can be shut away when out of use. The bracket attached to the down tube of the sidecar is of somewhat novel design, and is fitted with a ball joint which can be locked in any position, thus ensuring perfect alignment and allowing the motor bicycle to pull directly on the sidecar. Usually these brackets take the pull through a right angle tube.

## SPEED TRIALS AT PENRITH.

The Cumberland County Motor Cycling Club held its open speed trials on Bank Holiday at Lowther Park, Penrith, by the kind permission of Lord Lonsdale. The programme, which was excellently managed, consisted of six classes, six of which were open events, the remaining being limited to members of the club.

The course, which was one of half a mile, presented a somewhat difficult turn and steep descent, but, in spite of this and the condition of the road owing to the heavy rains, some excellent times were made. The fastest time of the day, irrespective of weight, was made by H. Mason, Newcastle-on-Tyne, on a 5-6 h.p. Matchless, in 27 $\frac{1}{2}$ s., with a flying start. The medal for this was given by Mr. W. B. Cole, the captain of the club. Mason, riding a 2 $\frac{3}{4}$  h.p. J.T., also secured for the fastest time (33 $\frac{1}{2}$ s.) in the lightweight class the medal given by Mr. W. Harrison, of the Graphic Garage, Penrith.

**Lightweights, singles and twin:** 1, H. Mason (2 $\frac{3}{4}$  N.U.T.); 2, W. Phillpott (2 Humber); 3, R. N. Corah (2 $\frac{3}{4}$  Corah). **Fouring singles on formula:** 1, E. Cooke (3 $\frac{1}{2}$  A.S.L.); 2, Burras (3 $\frac{1}{2}$  Zenith); 3, J. S. Whitelock (3 $\frac{1}{2}$  Rudge).

**Racing singles:** 1, R. Bowness (3 $\frac{1}{2}$  Matchless, 29 $\frac{1}{2}$ s.); 2, — (3 $\frac{1}{2}$  Corah), 31 $\frac{1}{2}$ s.; 3, S. Crawley (3 $\frac{1}{2}$  Triumph), 32 $\frac{1}{2}$ s. **Twin-cylinders on formula:** 1, H. Mason (5 Matchless); 2, A. J. Moffat (6 Zenith); 3, B. Jeffreys (6 Bat).

**Amateurs on time (any machine):** 1, R. Bowness (3 $\frac{1}{2}$  Matchless), 30s.; 2, B. Jeffreys (6 Bat), 30 $\frac{1}{2}$ s.; 3, A. J. Moffat (6 Zenith), 30 $\frac{3}{4}$ s.

**Sidecar:** 1, S. W. Braithwaite (3 $\frac{1}{2}$  Rudge); 2, E. Burras (6 Zenith).

**Members' lightweight:** 1, H. Mason (2 $\frac{3}{4}$  N.U.T.); 2, H. W. (2 $\frac{3}{4}$  N.U.T.); 3, J. W. Whitelock (2 $\frac{3}{4}$  N.S.U.).

Members, any capacity, single or twin: 1, S. Crawley (3 $\frac{1}{2}$  Triumph); 2, H. Mason (6 Matchless); 3, R. Bowness (3 $\frac{1}{2}$  Matchless).

The first ascent of Bwlch-y-Groes by a cyclecar. The machine is an 8 h.p. Morgan, and the climb was made by Mr. Rey T. Aston, hon. joint sec. of the North Stafford M.C.C., on the 20th ult. The same machine went up Mow Cop (Staffs.) on the 28th ult.

## Judges' Report of the Scottish Six Days' Trial.

THE judges are particularly pleased with the manner in which the competing machines have fulfilled the conditions of the Trial, and the large number who have gained full marks in what is admittedly the severest test ever yet organised.

The number of retirements is phenomenal, no less than thirty-one having retired for various reasons. Many were due solely to the lack of reasonable care on the part of the competitors.

### Excellent Hill Climbing.

The judges are of opinion that had the sections been shorter fewer competitors would have gained full marks, as a great majority of riders had trouble of a more or less serious nature during at least one section.

The hill-climbing performances of the majority of machines were excellent, and the greatest improvement is perhaps noticeable in the manner in which many machines were able to climb for two miles at a stretch on a low gear without showing symptoms of overheating.

Although a few of the single-gear machines did remarkably well in their performances, the excellence of the respective performances was more on the part of the individual than on the part of the machine, and they cannot recommend anybody to contemplate touring in Scotland in any portion over which the route extended to attempt motor cycling on a single-geared machine.

### Variable Gears Do Well.

The variable gears performed well, and few cases of trouble were reported, and such as came to their knowledge were caused chiefly by falls.

The judges were particularly disappointed at the poor results given by the supposed waterproof magnetos, scarcely one of which was really rainproof in the correct sense of the word, and during the wet weather caused a great deal of difficulty to the competitors, especially in starting. They are of opinion that this could be improved without difficulty. Belts showed up comparatively well in the wet weather, and the majority of competitors did not experience much difficulty in this respect. Chains also stood the test well.

The judges were particularly pleased with the performances made by the cyclecars—two in number—which performed most excellently on all the hills and generally giving good performances. The friction drive fitted to the

two cyclecars seemed very satisfactory, and gave no trouble throughout the whole test. As regards the sidecars, the judges cannot give quite such a favourable report, as the majority of the sidecars were in a broken-down condition at the completion of the test. All the sidecars which got through did good performances, in so far as many of the roads were very much more severe for sidecars than they were for solo machines.

### Too many Broken Fittings.

The judges were disappointed at the manner in which sundry fittings failed to withstand the test, broken mudguards, carriers, and the like being too numerous, while the same applies to the more minor fittings. Several cases of broken frames are reported, and the judges do not think this satisfactory, nor do they think that the forks fitted to many of the machines were of a sufficiently sturdy nature to be fit for the work required of them, and the twisted forks, admittedly caused by the careless riding of many of the competitors, were too frequent.

The judges were pleased to notice the good condition of the wheel rims, which stood the test of the rough roads particularly well.

### Lack of Power at End of 1,000 Miles.

The judges have to notice that the hill-climbing powers of the competing machines were not so good at the conclusion of the test as they had been during earlier periods of the trial, and they are of opinion that there should be no material loss of power after a journey of 1,000 miles, which constitutes about a quarter of an average year's run. This loss of power is mainly attributable to an excess of lubrication, which is, or ought to be, unnecessary.

The judges are quite satisfied with the manner in which tyres stood the test, several of the competitors going through the whole journey without a puncture. They, however, would point out that the users of one particular make found great difficulty in negotiating corners even where the roads were dry, there being too great a tendency towards dry skidding.

In conclusion, the judges are fairly pleased with the condition of the machines at the finish, and much of the damage noticeable was due solely to the lack of care on the part of the riders, and not to fault on the part of the machine, and it speaks well for the general improvement that so many of the machines finished in good condition.

### Army Manœuvres.

THE details of the conditions under which members of the Legion of Cyclists will be employed during the culminating week of the Army manœuvres have just come to hand, and the terms offered by the military authorities are sufficiently liberal to cover more than any reasonable expense to which motor cyclists might be subjected. Any motor cyclist who wishes to take part, therefore, in Army manœuvres should at once register himself as a member of the Legion of Cyclists and send in his application to the honorary secretary to attend manœuvres. The conditions laid down by the War Office are as follows:

1. Free railway pass for man and machine from home to Cambridge (and return).
2. Eight shillings a day petrol allowance to cover wear and tear of motor cycle, oil consumption, and insurance. (This allowance will not be payable for days spent in train journeys when the man and machine are not available for military duty.)
3. Free messing and lodging in camp, or when this is impracticable (as is usually the case) eight shillings a day to cover hotel expenses.

The forty motor cyclists supplied by the Legion of Cyclists will be utilised with defending force together with twenty men supplied by the A.C.U., and those who are desirous of taking part should apply at once, as there are very few vacancies left. The period during which the men's services will be required is from September 14th to 20th, both days inclusive.

### A Unique Opportunity.

Never before in the history of British peace manœuvres have so many troops been called out as will be the case next September, for in addition to the 70,000 regulars there will be 10,000 cyclists, of whom 3,000 will be drawn from the various cyclist battalions and will include a considerable number of motor cyclists. It is probable, therefore, that the number of motor cyclists employed will be greatly in excess of those called out on any previous occasion, and a rough estimate places their number as follows:

Furnished by the A.C.U. ... ..	20
Furnished by the A.A. and M.U. ... ..	60
Furnished by the Legion of Cyclists ... ..	40
Furnished by Territorial Cyclist Battalions ... ..	70
Furnished by Regular Army ... ..	20
Furnished by Officers' Training Corps ... ..	15
Furnished by Special Reserve, etc., and R.E. ... ..	30
<b>Total ... ..</b>	<b>255</b>

In addition to those who will be allotted to specific duties there are sure to be a goodly number of attached officers and men who will turn out on motor cycles, and thus bring the number up to close upon the three hundred mark.

### A Few Hints.

I would like to impress a few suggestions upon those who are selected to take part in manœuvres, and who have not had any previous experience. First of all, as to expenses, which is usually a most important consideration. The allowances provided by Government amount to sixteen shillings a day, and the average distance that men will be called upon to travel will hardly exceed fifty miles a day, so that it will be seen there is a fair margin left for living-expenses. On the other hand, it must be remembered that when 80,000 men are suddenly imported into a country district supplies are apt to run short and accommodation is liable to be well-nigh unobtainable. The umpires, the directors, the foreign attachés, and the press invade the hotels and fill them to overflowing. Generals and regimental commanders fill up farmhouses and country inns, whilst staff clerks and other orderlies eagerly grab any emergency accommodation that happens to be left. Personally, I should advise every motor cyclist to render himself independent of hospitality by providing himself with a blanket and a waterproof sheet or cape, then if the worst comes to the worst he can doss down in the first tent or shed that is handy.

Secondly, the motorist should disabuse his mind of any previous notions he may possess as to the necessity of four meals a day at given hours, because he will probably have to content himself with snacks at one meal a day (and lucky if he finds place, time, or opportunity to get that!). Instead of going to an overcrowded hotel and paying three shillings for an inferior breakfast he will do far better to throw himself on the indulgence of a farmstead.

Then as regards the machine, make it as weather-proof as you possibly can. It may, of course, be fine and dry, but it is wiser to be prepared for the worst. A good lamp is essential, as many journeys have to be run at night when troops and unlit waggons may be encountered on the road. Good non-skid tyres should also be fitted, since in wet weather the traffic of an army cuts up roads to an appalling condition of slush, especially on the steeper portions of gradients.

### Addenda.

Since writing the above I have heard that the full complement of men required for the period September 14th-20th has been filled up, but that there are no vacancies for twenty-two men for the period September 8th to 20th. A P.O. for 1s. should be sent with each application to defray postages and probable telegram

### LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

# BANK HOLIDAY RACING AT BROOKLANDS.

THE changeable weather doubtless had some effect on the attendance at Brooklands on Monday, but despite the blustering wind and an occasional shower, there was a very fair number of people. The meeting began at noon instead of 2 p.m., and there was a good number of events, which were well supported, with several exciting incidents to keep up the general interest. The first motor cycle event was the Eleventh Short Motor Cycle Handicap. Prizes, £10 or cup at option, £5 or cup, £3 or cup. Distance, 5½ miles. Fork start, long finishing line.

The machines passed the fork once and then entered the straight. Of the competing machines several were worthy of comment. Pickin's Rudge had an air inlet in the induction pipe. T. W. Wartnaby put the mechanism lubricated W.D. on the track for the first time, and F. H. Arnott, "Humming Bird" fame, rode a machine which showed no signs of special attention outwardly, but in the interior doubtless concealed secrets which its owner would not give away to the world. Unfortunately, Arnott lost his belt, and did not finish. Townsend, the rider of a Zenith, had a smash near the tunnel. He was riding on a badly-worn front fork. This burst, and he fell on his head and slid down the banking. Paul, the hon. medical officer, was quickly on the scene, and eventually the poor victim was conveyed to the hospital on the aviation ground. His head was badly cut, he was suffering from concussion, and his hands were severely damaged, but fortunately no bones were broken. At the start Elce (Rudge) was slow at getting away, and Mills had considerable difficulty in getting his machine to fire. Elcebold in starting made a bad move, and nearly collided with the rider next to him. The first lap order was: Square, Smith, Croucher, Bailey, S. R. Cooke, Elce, Timson, Newbold, "Pontin," Remington, Fowler, Stanley, Townend, Garrett, Spencer, Wartnaby, Huckle, Elce, Whitehead, and Pickin. It was a good race, thanks to the skilful handicapping of Mr. Ebbelwhite, Elce winning by a few lengths, and Newbold and Stanley (scratch) second and third, finishing almost neck and neck. Result:

	Bore and stroke.	c.c.	m. s.
W. H. Elce (1 Rudge) ...	85x88	499	0 46
P. Newbold (2 Zenith) ...	76x85	771	0 32
G. E. Stanley (1 Singer) ...	85x88	499	0 28*
R. Croucher (1 Kerry-Abingdon) ...	85x88	499	1 10
S. L. Bailey (2 Douglas) ...	61x60	351	0 58
J. A. Manners-Smith (1 Triumph) ...	85x88	499	1 10
S. D. Timson (1 Rudge) ...	85x88	499	0 58
S. R. Cooke (1 Rudge) ...	85x88	499	1 18
S. F. Garrett (1 Green-Precision) ...	85x88	499	0 46
B. C. Remington (1 Rudge) ...	85x88	499	0 58
W. G. Fowler (1 Rudge) ...	85x88	499	1 10
H. H. Huckle (2 Zenith) ...	76x54.5	494	0 46
"A. E. Pontin" (1 Rudge) ...	85x88	499	1 18
W. T. W. Wartnaby (1 W.D.) ...	85x88	499	0 46
H. H. Square (1 Robin-Minerva) ...	69x69	258	3 0
J. Gibbs (2 Humber) ...	60x60	340	1 34
C. Whitehead (1 Triumph) ...	85x88	499	0 58

\*Scratch.

The winner's speed was 62½ miles per hour.

## Ninth Long Distance Handicap.

The next motor cycle event was the Ninth Long Distance Handicap. Prizes as in the previous race. Fork start. Long finishing line. In the event before the motor cycle races the well-known Triumph rider at Brooklands, M. Campbell, while racing his Darracq, burst a tyre, hit the edge of the track, and smashed both off side fenders. At the start Garrett, as facetiously garrulous as ever, made the wait before the word to "go" pass quickly.

As Slatter, on the baby Alcyon, 3m. 27s. start, got away in good form, and Garrett asked Mr. Ebbelwhite if he might have a small machine and secure a big start, Remington left the line on one cylinder, and Croucher retired during the first lap. The first lap order was: Slatter, Cooke, "Pontin," Arnott, Croucher, Gibbs, Stanley, Dewar, Garrett, Hannis Mills, Huckle, Elce, Yano, Wartnaby, and Remington. On the second lap the order was as follows: Slatter, Arnott, Garrett, Stanley, Dewar, Cooke, Mills, Elce, Huckle, Yano, and Wartnaby.

The English-Dutch Trial. Unloading machines at Harwich Station.

## A Double Victory.

At the finish Arnott showed what his machine was worth, and much to the surprise of the handicapper he romped in an easy winner, and brought home the second Rudge that day to victory at a speed of 60½ m.p.h. Result:

	Bore and stroke.	c.c.	m. s.
(1.) F. H. Arnott (1 Rudge) ...	85x88	499	1 27
(2.) S. F. Garrett (1 Green-Precision) ...	85x88	499	1 9
(3.) G. E. Stanley (1 Singer) ...	69x80	294	1 27
H. C. Mills (1 Green-Precision) ...	85x88	499	1 9
W. Dewar (1 Triumph) ...	85x88	499	1 27
N. D. Slatter (1 Alcyon) ...	62x82	247	3 27
H. H. Huckle (2 Zenith) ...	76x54.5	494	1 9
W. H. Elce (1 Rudge) ...	85x88	499	1 9
S. R. Cooke (1 Rudge) ...	85x88	499	1 57
J. Gibbs (2 Humber) ...	60x60	340	2 21
W. T. W. Wartnaby (1 W.D.) ...	85x88	499	1 9
S. L. Bailey (2 Douglas) ...	61x60	351	1 27

Bailey's Douglas came in on one cylinder as he broke an exhaust valve. Arnott's win qualified him to run in the Winners' Handicap with 53s. start in company with the following competitors: K. Yano (25.8 Bedford), 49s.; C. H. Bird (15.9 Sunbeam), 10s.; McL. N. Staigh (15.9 S.C.A.R.), 36s.; L. Coatalen (30.1 Sunbeam), scr.; Turner-Smith (13.9 Stoewer); and G. W. Hands (12 Calthorne). Arnott led easily and would have won but, instead of coming down the straight as he should have done, he completed a lap and thus lost the cup value £12 10s.

Jake de Rosier, who writes from the Crocker Street Hospital, Los Angeles (Cal.), wishes to thank Messrs. W. Macneill and T. A. Carter for their donations recently forwarded through *The Motor Cycle*. De Rosier says that the broken bones only began to knit about three weeks ago, but it certainly braces a man up to know he is not forgotten by his English friends. He is still on his back, and is likely to remain so for some considerable time.

### Sheffield and Hallamshire M.C.C.

The officials of the Sheffield and Hallamshire M.C.C. report an error in the results of the open hill-climb held on July 27th. The error was in Class IV., T.T. singles up to 560 c.c., and the results should have read as follows: 1, Dan Bradbury (3½ Norton), figure of merit 87.4; 2, K. Clarke (3½ Corah), 98.4; 3, E. L. Moxey (3½ B.S.A.), 99.0.

### Exeter and District M.C.C.

Sixteen riders started on the second twenty-four hours' reliability trial held by the club on the evening of the 26th ult. for the Gould Cup. Results (subject to confirmation):

1, S. J. Sanders (3½ Rudge Multi), 21m. 29s. error; 2, J. Milner (3½ Rudge Multi), 47m. 28s. error; 3, A. C. Arden (3½ T.T. Premier), 56m, 3s. error.

### Westmorland M.C.C.

The hill-climb held last week at High Cross Moor, Lancaster, resulted as follows:

Lightweights.—1, S. H. Phillpott (Humber).

Single-cylinders.—1, G. H. Braithwaite (Zenith); 2, L. Pierce (Corah); 3, J. Dean (Singer).

Twin-cylinders.—1, A. I. Moffat (Zenith); 2, B. Jefferys (Bat); 3, I. H. Nelson (Scott).

Sidecars: 1, B. A. Jervis (6 Zenith); 2, H. H. Satterthwaite (8 Matchless).

Fastest time of day.—B. A. Jervis (6 Zenith).

### Dewsbury M.C.

The club held their second hill-climb of the season on Tuesday, the 30th ult., on the knock-out principle. Results: Class I. (open to all members): 1, S. Dawson (T.T. B.S.A.); 2, F. Ward (Zenith-Gradua); 3, C. Sydney (Bradbury).

Class II. (open to members not having previously won a prize in similar event): 1, S. Dawson (T.T. B.S.A.); 2, H. Hainsworth (Triumph); 3, G. H. Hirst (James).

The members' reliability trial for the Fenton Cup will take place on the 13th inst. There will be two classes, solo and passenger.

### Durham and District M.C.C.

A speed trial was held on the 24th ult. over a quarter-mile stretch of good road, and some good times were made. In the single-cylinder class the result was as follows:

Rider and machine.	Time in secs.	Speed m.p.h.
1. C. W. Smith (3½ Smith-Precision)	12½	73.77
2. E. Turvey, jun. (3½ B.S.A.)	12¾	71.42
3. R. B. Smith (3½ Ariel)	13¾	66.17

F. C. Wake (6 h.p. twin Zenith) covered the course in 11½s., this being equivalent to a speed of 76.27 m.p.h., but, as there were only two entries in the twin class, this class was cancelled.

An all-night reliability trial was held on the 27th-28th ult., commencing at 8.30 p.m. The route was Durham, York, Scarborough, Whitby, Saltburn, Stockton, to Durham, a total distance of 185 miles. Seven competitors started, in fair weather, but soon encountered much rain and thunder, therefore the stop of two hours and a half near York for refreshments proved very acceptable. Only three competitors succeeded in completing the course, and the result was as follows: 1, C. F. Christon (3½ Triumph); 2, R. B. Smith (3½ Ariel); 3, G. Philburn (3 Fafnir).

A hill-climb was held on the 31st ult. at 6.30 p.m. The hill chosen was perfectly straight and the surface very good, some fast times being the result. Results:

Single-cylinders.—1, E. Turvey (3½ B.S.A.), 30s., gold medal; 2, C. Smith (3½ Smith-Precision), 31s., silver medal; 3, J. P. Forster (3½ Rudge), 34s., bronze medal.

Twin Class.—1, F. Wake (6 Zenith), 26½s., gold medal.

Sidecar Class.—R. Maughan (8 Matchless), 48½s., silver medal.

### Herts County A. and Ae.C.

The members' hill-climb will take place on the 10th inst. There will be classes for machines up to 350 c.c., 500 c.c., 750 c.c., unlimited capacity, and passenger machines up to 1,100 c.c. The Motor Cycle formula  $\frac{C \times T^2}{W}$  will be used in the handicap classes; which will be open only to amateurs riding their own machines.

### Mid-Staffordshire A.C.

An inter-club hill-climbing competition was held at St. Cop, Rugeley, on the 27th ult. Some excellent sport witnessed, the hill being a fast one. Results:

1, G. W. Huntbach (3½ h.p. Premier), winner of medal Harley Jones challenge cup; 2, S. C. Witcomb (8 h.p. Matchless); 3, — Russell (3½ h.p. Russell). Fastest time, J. Prendergast (3½ h.p. Ivy-Precision).

The members of the following clubs were competing: Derby and North Staffs., Leicester, North Staffs. M.C.C., Mid-Staffs. A.C.

Both cup and fastest time were obtained by the North Staffs. M.C.C.

### Dublin and District M.C.C.

This trial to Glengariffe and back took place on the 27th and 6th inst. The following arrived at Glengariffe on the 27th: H. T. Carroll (3½ Rex), G. Roche (3½ Rover), T. E. Gre (3½ Rudge), McAreyve (3½ Rex), R. Walshe (3½ Calthor), F. J. Walker (3½ Rudge), V. J. Farrell (3½ Triumph), Doleman (3½ Rudge), J. Browne (3½ Rudge), F. Jules (Premier), J. Webster (3½ Hobart), T. Woods (3½ Ariel), T. D. Rollins (3½ Rover), B. J. Gogarty (3½ Triumph), W. G. Greene (2½ A.J.S.) arrived late. Dunphy retired Cahir with magneto trouble. P. H. Hurse (3½ Rudge) lided with a cow at Maryboro' and damaged his machine. Woods had a collision with a dog near Cahir and sustained injuries, but reached here. Browne (3½ Rudge) shed the spokes from his back wheel. J. D. Weirs (6 Ent sc.) was last seen stopped after coming through the flood near Maryboro'. Several riders had trouble here for same cause. J. Healy (3½ Rudge sc.) had belt trouble was late at Mallow; later he burst his back tyre at R. more and transferred his passenger to McAreyve's car and drove on the rim to Killarney. H. A. Conneff last seen with a puncture.

### Crossgates and District M.C.C.

Speed trials were held in Templenewsam Park on the 27th ult., by the kind permission of the Hon. E. L. Wood. The course was about three furlongs, and some excellent sport witnessed. The best times registered were:

#### SOLO CLASS.

Rider and machine.	Time.
*H. E. Haswell (3½ h.p. Bradbury)	25s.
*A. Kirk (3½ h.p. Premier)	25s.
F. Crosthwaite (8 h.p. Matchless)	25½s.
H. Whitfield (3½ h.p. Triumph)	25½s.
T. Wilkinson (6 h.p. Matchless)	25½s.
G. Botterill (3½ h.p. Triumph)	25½s.

#### SIDECAR CLASS.

Vernon Crosthwaite (8 h.p. Dot)	29s.
F. Crosthwaite (8 h.p. Matchless)	32s.
H. E. Haswell (3½ h.p. Bradbury)	32s.
H. Whitfield (3½ h.p. Triumph)	34½s.
J. Stuart-White (3½ h.p. Bradbury)	37½s.
A. Longbottom (4 h.p. Singer)	39s.

\*Tied for fastest time of the day.

The handicap was formulated on a trial run. Results Solo Class.—1, W. Bramley (3½ Triumph); 2, J. Stuart-White (3½ Bradbury).

Sidecar Class.—1, A. Longbottom; 2, V. Crosthwaite H. Whitfield.

Competitors in the Wolverhampton M.C.C. contest for the Corke cup.

### Wolverhampton M.C.C.

The reliability trial for the Corke Cup was run off on the 28th ult. The route was *via* Bewdley, Ludlow, Knighton, Church Stretton, Shrewsbury, and Wellington, 140 miles in all.

### North Birmingham A.C.

The first hill-climb held by this club took place at Throak on the 27th ult. Results: Solo class: 1, F. W. Southern (Premier); 2, O. Curpley (Ith); 3, N. Fairley (Ivy-Precision). Decars: 1, J. D. Watson (B.S.A.); 2, G. Maxfield (pedo); 3, G. Blood (Kynoch). Hon. sec., Mr. W. Russell, 1, Oakfield Road, Erdington.

### North Staffordshire M.C.C.

The annual reliability trial for the president's trophy took place on the 23th ult. The start was from Whitmore, and the course, which was secret till the morning of the trial, took the competitors through North Wales, and was about 100 miles, *via* Shrewsbury, Knighton, Newtown, Llanfair, Penin, Dolgelly, Llangollen, and back to Whitmore. Results: 1, G. Tagg (Regal-Precision), error 35m., trophy and gold medal; 2, J. Attwood (Bradbury), 40m., gold medal; 3, G. Zenith, 50m., silver medal.

### Cumberland County M.C.C.

The result of the Bessentbwaite to Harrogate and back (100 miles) reliability trial for the Piel Wyke Challenge Cup and club medals is as under: 1 (cup and gold medal), H. Robinson (3½ T.T. B.S.A.), no marks lost; 2, E. A. Hale (3½ Scott) and Beck (3½ T.T. Triumph), five marks (equal). This is the second year in succession H. Robinson has won the cup, which now becomes his own property. The other could not have been worse, fully half the distance was run in a perfect downpour. The result of the speed judging, which took place from the Merdale Boat House was: Whitelock (Rudge) and Little (Rudge) tied for first place, both arriving dead on time, Hilton Robinson (B.S.A.) being third, 1m. fast.

### Fleet and District M.C.C.

A reliability trial was held on the 27th ult. for the Kinder Cup. Results: 1, J. Haszard; 2, C. Q. Roberts; 3, G. Meredith. Six competitors made non-stop runs.

### A.C.U. SILENCER TESTS.

The Experimental Silencer Contracted. (See page 871).

### Bristol M.C.C.

The long-distance trial (400 miles) to Llandudno and back took place on the 26th and 27th ult. Out of an entry of fourteen, only seven faced the starter. The results were gold medals to the following six: H. Hutchinson and F. P. Davis on Ridges, and Eli Clark, F. C. Wasley, P. Phillips, and E. Kickham on Douglasses. J. B. Kellar (B.S.A.) had the misfortune to blow out inlet valve cap, and was forced to retire twenty-seven miles from the finish.

Five members of the B.M.C.C. are riding in the Six Days' Trials, Messrs. Fry, Grout, and Wasley forming the private owners' club team, all on Douglas machines.

Exeter and District M.C.C. 24 Hours Reliability Trial. A group of competitors at Staines in the early morning before the start of the return journey.

# A.C.U. SIX DAYS' TRIALS.

the  
**L. M. C.**

District Office, A.M.P. Society,  
TAMWORTH, N.S.W., AUSTRALIA, June 24th, 1912.

Dear Sirs,

Last August I purchased a 3½ h.p. **L.M.C. Cob** model for experimental purposes. As an agent of the above Society I worked my large district by train, bicycle, buggy and pair. Your local agent here, R. W. Webster, urged me to get one, absolutely assuring me that I would double my earnings, for we are purely on commission. This I have succeeded in doing during my first six months, and at present I am earning nearly as much in a week as I made in a month by train and buggy.

The comfort one has in doing a long country run on our bush roads is remarkable. Its all very fine to read about trial runs on a prepared track, but when you see my machine which averages 250 a week over wheat fields, sheep runs through paddocks (fields), and the roughest of bush roads, it really seems impossible.

My tyre troubles are my chief worry, simply because the surface of many of the roads is rough and rocky. I have completed just on 4,000 miles up to date.

On a trip from Barraba to Tamworth, our local express does the journey in 6½ hours. The distance is 56 miles. Last Thursday I left Barraba just as the train had gone at 4-15 p.m.; and I was having my tea here at five past six. The express got in at twenty past ten o'clock. (Mixed train).

Would you please send me your latest catalogue. I intend selling my old machine at Christmas, and getting the latest 3½ Cob model again.

If you desire it I will forward you a photo of myself and my machine.

Wishing the L.M.C. continued success and I personally see it is always in evidence here.

Yours faithfully, R. W. FERRELL.

In answering these advertisements it is desirable to mention "The Motor Cycle."

# "LYSO" Reliability

—The New "LYSO" Belt has proved beyond doubt its thorough Reliability in the hardest and most severe tests. Read these remarkable records recently achieved by machines fitted with the New "LYSO" Belt.

## The Scottish Six Days' Trial

—In this event—which is the most severe and arduous test that the machine could be put to—the following riders:—Vernon Taylor on a Rudge; W. D. South on a Rudge; H. Berwick on a New Hudson; J. Donaldson on a New Hudson; G. Griffiths on a Zenith, and G. L. Fletcher on a Douglas

## all used "LYSO" BELT

## —and all secured GOLD MEDAL

—R. Lord on a Rex and Miss Muriel Hind on a Rex obtained SILVER MEDALS, and E. Tolfree Bat obtained BRONZE MEDAL.

—These and all others who used the New "LYSO" experienced no belt trouble whatever.

**Sheffield and Hallamshire M.C.C. Open Hill Climb, July 27th, 1912.**—A. B. Wade on a Zenith secured FIRST place in the T.T. Class and also FIRST place in the Standard Class.

**Irish End-to-End Reliability Run.**—C. Kirk on a  $3\frac{1}{2}$  h.p. Triumph secured GOLD MEDAL. E. Ware on a  $2\frac{3}{4}$  h.p. Douglas obtained special prize for best lightweight performance.

### Read what Riders say of the "LYSO" Belt.

"I return you the New 'LYSO' Belt that I used on my Singer with Sidecar on the worst roads in England, 3,600 miles in all kinds of weather. Your Belts are doing me splendid service."—HARRY LONG.

"Your Belt gave absolute satisfaction in the Irish End-to-End Run. I only shortened Belt once in 700 miles. I find this Belt has marvellous gripping qualities when slack."—CYRIL KIRK.

"The Behaviour of the New 'LYSO' Belt in the T.T. Races was highly satisfactory, the same Belt used without adjustment through both races and still is in perfect condition."—E. KICKHAM.

"The New 'LYSO' Belt I used in the T.T. Races gave no trouble whatever. I used the same Belt in the Sidecar Race at Brooklands on July 6th when I obtained first place, and also in the B.A.R.C. Meeting at Brooklands July 13th when I again got first place. I must say for the hard work I gave it the Belt behaved abnormally well."—E. B. WARE.

—Fit YOUR mount NOW with the New "LYSO" Belt—the "Perfect Power-transmitter."

Of all Agents, etc. Prices: Size  $\frac{3}{8}$  in. 1/5;  $\frac{7}{8}$  in. 1/9;  $1\frac{1}{8}$  in. 2/1; 1 in. 2/4; and  $1\frac{3}{4}$  in. 2/9 per foot.

**LYCETT'S, "The Saddlery," Bromley Street, Birmingham**

### Slow Hill-climbing in the A.C.U. Six Days.

In the A.C.U. Six Days competitors are going to be penalised unless they can climb certain test hills "on their top gears at a speed not exceeding 12 m.p.h." What is a "top gear"? I have a three-speed hub in conjunction with an adjustable engine pulley, and if I choose I can adjust the engine pulley down to give a direct drive of  $6\frac{1}{2}$  to 1; this would be my middle gear, and with this setting my top gear would be  $4\frac{1}{2}$ , scarcely low enough for a freak hill like Countisbury, but I should be a fool to drive through the trial with so small an engine pulley—it would be asking for belt troubles. Will competitors be allowed to adjust their pulleys to any gear they like near the start of a slow climb, or will they be compelled to use their ordinary running ratios?

On the other hand, if I used a three-speed hub of different make, the top gear would be the direct drive, and in ordinary running would be, say,  $4\frac{1}{2}$  to 1, thus giving a second gear of about  $6\frac{1}{2}$ , and a bottom gear of 9—the ordinary trial ratios for men using this particular hub; but for a top gear slow climb of Countisbury, the users of this hub could drop their pulleys to  $6\frac{1}{2}$  if permitted, thus reducing their two lower ratios to about 9 and 13 to 1, which is absurd.

To my mind there is a mystery surrounding these slow hill-climbs, and surely the only sensible way to deal with them is to apportion a gear limit for each test hill for each type of engine. I suspect the idea is to make the men do the climb non-stop on their ordinary running ratios, in which case users of certain machines will be caught napping with gears almost as high as  $3\frac{1}{2}$  to 1 (geared up top ratios), which is absurd.

Why not say plainly that a  $3\frac{1}{2}$  h.p. machine must not be geared lower than, say, 5 to 1 for these tests, or a  $2\frac{3}{4}$  h.p. lower than 6 to 1? At present the unfortunate entrants do not know where they are.

### Gashed Covers.

In the past I have very frequently engaged in long and messy processes whenever I gashed a cover clean through, my repairs taking the line of solutioning patches and canvas to the cover itself. Recent experience has taught me a more excellent way. A lasting repair is an expert job, and best entrusted to the makers; what we desire is a sound temporary expedient which may enable us to conclude our trip or tour. The best plan is to use one of the light gaiters, designed to slip between tube and cover, and possessing thin flaps of rubbered canvas which are clipped in the clinch by the beads; thick flaps make the tyre very awkward to replace, and may even cause it to blow off afterwards; strap-on gaiters are impossible with rim brakes, and may shift the spokes. Having one of these light-flapped gaiters, a good plan is to take a piece of canvas or roll of wide tape and wind it spirally around the partially deflated tube, so that two thicknesses of material embrace the tube. The diameter of the cylinder must roughly approxi-

mate to the diameter of the inflated tube, though of course it has to be rolled round the tube when the latter is deflated. Care must be taken in tucking such a loose roll inside the cover, for any turned-over edges may chafe and cause fresh trouble. A liberal amount of French chalk should be dusted over the lot. A repair of this kind has lasted over 100 miles on my back tyre. I am sure it is a mistake to use any other type of gaiters, or to repair covers on the road, when these simple methods occupy no more time than a simple tube patch takes to affix.

### Exhaust Valve Lifters.

Such refinements as the exact method of raising the exhaust valve for starting or coasting purposes reveal the size of a designer's brain cavity, and in this connection I should like to pay a special tribute to the Rudge, which has as effortless a valve lifter as I ever tweaked on a hairpin bend.

I saw a well-known rider preparing his machine for a big trial the other day, and reminded him of some 1911 wrestlings when he broke his valve lifter wire on the first day of a week's trial. He smiled astutely, and conducting me to the offside of his jigger, proudly indicated a small pedal, rod and hook, not exceeding 5 ozs. in weight, which enabled him to foot-operate his valve lifter in the event of a broken wire.

It struck me that this fitting would not be unwelcome on the average machine. It is delightful for long coasts, useful in emergencies, and leaves both hands free for awkward blind corners. My own machine, for instance, has a throttle which does not shut dead tight, and it possesses neither air lever nor switch. If my valve lifter wire broke unexpectedly, I might find myself in a pretty pickle.

Trying to kick off the high tension wire while steering through a flock of sheep would be most exciting.

A.C.U. SILENCER TESTS.

The judges observing the effect of the telescopic silencer fitted to a Rudge.

# THE Douglas

VIBRATIONLESS      LIGHTWEIGHT

Referring to the  
Test Hill - Climb  
at Brooklands,  
"The Motor Cycle"  
(July 25th) said:

"Bailey's  
ascent  
was  
marvellous."

S. L. Bailey (Douglas), winner  
of the All Comers' Handicap  
at Brooklands on July 20th.

# QUESTIONS & REPLIES

589

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Timing a Twin Minerva.

Will you kindly let me know as clearly as possible how to time my  $4\frac{1}{2}$  twin Minerva m.o.i.v. motor cycle 45° engine, as it is a great trouble to alter, having internal timing wheels. Starting from the front cylinder I take it that the inlet valve should open as the piston is at the top of cylinder. Then I do not know exactly how to go on with the back cylinder.—W.J.C.B.

The method of timing a twin is the same for a single. The inlet valve should open and the exhaust valve close almost at the same moment, viz., when the piston has descended a very little way on the compression stroke. Time the back cylinder this way, then turn the engine  $1\frac{1}{2}$  revolutions and time the front cylinder in the same way. The exhaust valves should open when the pistons have descended six-sevenths of the firing stroke. A piece of cigarette paper placed between the valve stem and tappet will show the opening and closing of the valves very accurately.

## Motor Cycle Regulations in Jersey.

What are the laws and regulations with regard to motor cycles in Jersey, Channel Islands? As a permanent resident, what tax would I have to pay?—W.H.H.

Special regulations apply to motor vehicles in the island of Jersey, but motorists who drive to the danger of the police are proceeded against. We take from that that no number plates are required, and that you can drive a motor cycle without licence, registration, or driving licence. In Guernsey you must give written notice annually concerning the number of motor cycles which belong to you to the Chief of Police under a penalty not exceeding £10, and you will receive annually from the police a licence. The police indicate the numbers to be carried, which have to be painted on the back of a car on a black plate in white letters, but nothing is said about carrying a front number plate or illuminating it. An annual tax of 2s. 6d. must be paid on any kind of cycle. In the streets of towns where drivers of other vehicles are obliged to proceed at walking pace a speed of four miles per hour is necessary or a penalty not exceeding £1. These are all the particulars we have regarding the Channel Islands, but you could obtain further particulars on application to the police on arrival.

## Sudden Loss of Power.

I shall be glad if you can elucidate for me the following puzzle. My  $3\frac{1}{2}$  F.E. machine (1911) has developed the curious and annoying habit of suddenly pulling up on ordinary gradients after, say, a couple of miles running at about 30 m.p.h. When travelling well at 30 up a hill of about 1 in 12 or 1 in 15, it suddenly slows down and stops as though the brake were on or the throttle closed—no "conking," but a sort of spitting and spluttering in the exhaust box. I can't persuade myself it is overheating, as there is no knocking, and with a  $4\frac{1}{2}$  gear it should run for miles at 30 or over. The symptoms point to starving of petrol, but I have carefully examined petrol pipe and have run off half a gallon direct to prove there is no "air lock." B. and B. carburettor just returned from makers for adjustment, as I suspected that; compression good, and timing of valves carefully checked, no misfiring, and "break" occurs a few mm. before top of compression stroke. The curious

thing is that just as it pulls up, without knocking, putting out the clutch does not keep engine firing, and, as I have said, there appears to be no missing at the plug—though I have tried changing that. When it occurred on a hill recently I turned round straight away, fired to the bottom, and started up straight away from clutch and took the hill easily. I can get 45 on the level for short stretch easily, and there seems plenty of power in the ordinary way, but this sudden stoppage beats me. If you think it is overheating, why is there no sign of knock? I use plenty of Price's Huile de Luxe.—H.R.H.

It is difficult to diagnose the trouble without a personal examination of the machine, but it sounds like exhaust or inlet valve sticking or magneto rocker sticking. Should advise you to examine both. If you find valve at all a tight fit, take it out and rub stem with emery cloth until it is quite free. It probably expands when hot, and that is why the engine will pick up again after descending a hill and cooling down.

SCENE DURING THE SCOTTISH TRIALS.

J. H. Begg ( $3\frac{1}{2}$  h.p. Rudge) crossing the Caledonian Canal.

## Cyclecar Queries.

Could you kindly give me any information as to the cyclecar driven by C. M. Keiller, as to whether it is three-speed, free engine, and what petrol it consumes?—W.L.K.

The cyclecar referred to is the G.W.K. Full particulars of this can be obtained from the makers, Messrs. G.W.K., Ltd., Home Works, Datchet, Bucks. A detailed description and illustrations were published in *The Motor Cycle* of March 7th, page 249. Back numbers can be obtained from our Publishing Offices, 20, Tudor Street, E.C. The machine is friction driven and, therefore, has an infinitely variable gear between two points, the highest and lowest. A free engine is obtained by removing friction drum from friction wheel. As the engine is a twin-cylinder of about 1,000 c.c. the petrol consumption is probably in the neighbourhood of forty miles to the gallon.

## Responsibilities of Dog Owners.

I was motoring through the village of Birstwith, in Yorkshire, when I came across a farmer standing at his gate with his dog. Suddenly the dog jumped at me and followed for about half a mile, barking and running round the machine. On going a little further up the road I found I had taken the wrong turning, and had to return. I found the farmer and his dog still there, and again I had trouble, resulting in my being thrown from my machine, damaging my leg and also my motor cycle, owing to the dog getting in front of the wheel. The farmer never came to my assistance. When I recovered from the shock I went to him and asked why he did not call the dog away, and the answer I got was, "It always runs after motorists, and I can't stop it." I should be obliged if you could inform me whether I shall be able to claim for damage done to myself and cycle.—B.S.

There is no doubt that you have a good case against the farmer, as you are able to prove that the man knew of his dog's failings, which is the important thing

The silver cup presented by the president, Mr. William Allday, to the South Birmingham M.C.C. as a perpetual trophy.

in these cases. We should advise you to put the matter into the hands of a local solicitor if it becomes necessary, but make an attempt to settle out of court in the first place

## Obstruction in Petrol Supply.

My motor cycle runs quite smoothly at low speeds, but when at full or threequarter throttle, it starts misfiring and explosions occur in the silencer. It is also rather hard to get started, even when warm. Should I fit a larger or a smaller jet? I think it is the carburetter that is at fault; the magneto and plugs seem in good order.—E.S.

It is rather hard to say what the particular fault with the carburetter is without fuller information. When on full throttle and explosions occur in the silencer, you do not say what you are doing with the air lever, whether any alteration of the air lever makes any improvement. If closing the air lever causes a sudden acceleration and then afterwards the air lever can be opened it seems to indicate that there is a partial obstruction either in the jet or the vent in the filler cap is stopped up. Obviously, the petrol does not get to the carburetter quickly enough. The fact that the machine is rather hard to start leads one to suppose that there is some obstruction in the carburetter or else, through a union being loose, too much air reaches the engine.

## Gradients and Gears.

(1.) What is the steepest gradient that could be climbed (approximately) by a 2 h.p. machine in good tune on, first, an 8 to 1 gear; second, on a 6 to 1 gear? (2.) What are the most suitable gears for winter and summer for the above machine with a ten and a half stone rider? (3.) What would cause loss of compression in a two-stroke engine? Would such an engine be less liable to loss of compression than a four-stroke side by side valved engine? (4.) What is the gradient of the average main road hill; say the gradient of the steepest hill on the road to Bristol from Gloucester?—M.R.E.

(1.) It depends on weight of rider. Presuming he did not exceed eleven stones, the machine should climb a gradient of 1 in 8 with a gear ratio of 8 to 1. With a gear ratio of 6 to 1, it would probably climb a gradient up to 1 in 12, in both cases without pedal assistance. (2.) Summer gear we should recommend about 5½ to 1; winter 6½ to 1. (3.) Loss of compression in a two-stroke engine would be caused by leakage at the sparking plugs or piston rings, and if the crank case were used for compressing the gas, leakage would be caused by worn crankshaft bearings. The only reason why the two-stroke would be less liable to loss of compression than the four-stroke side by side valve engine would be because there would be no possibility of leakage at the valves. (4.) The average gradient of the steepest hill on the road to Bristol from Gloucester does not exceed 1 in 16. The route referred to is the one missing Thornbury. Of course it is just possible that a stretch on any of the hills might be considerably steeper, but there is nothing steep on this road.

## To Preserve Plated Parts.

Could you advise me on the following details for my new Triumph? (1.) What do you recommend for preserving the plating? I have heard painting celluloid on is good. If so, how is the celluloid liquefied? (2.) Is there anything on the market for painting the engine, but which will not wash off? What do you consider the best engine paint?—H. BLOXAM.

(1.) There are several special preservatives for plated parts of a machine, sold in tins ready for application. Celluloid in the ordinary way is liquefied by mixing in with acetone, but there is no need for you to do this when you can buy a preparation ready mixed. (2.) Radiolin and Ebonine are good preparations.

## EXPERIENCES WANTED.

"W.McL." (Cowdenbeath).—4½ h.p. Mead-Precision.

"C.O." (Ceylon).—Brampton gear.

"C.F.C." (Epsom). G.W.K. cyclecar.

"E.H.G." (Southwark).—2½ h.p. Gamage. Wearing qualities, etc.

"AB 2615 (Kidderminster).—3½ h.p. Scott and sidecar. Reliability, wear, etc.

"A.S." (London).—Bradbury and sidecar with three-speed Sturmey-Archer gear.

"Ideal" (Huddersfield).—G.W.K. cyclecar.

"F.W.W." (Dunmow).—Mabo countershaft gear on 3½ h.p. Triumph

THE KING'S PRIZE WINNER AT BISLEY.

Arthur Fulton, winner of the King's prize at Bisley. The photograph is interesting, as Mr. Fulton is an ardent motor cyclist, and rode to camp each day to compete in the great shooting competition. This should be a sufficiently convincing reply to that section who contend that motor cycling unsteadies the nerves.

Make of the Machine does not matter if the Engine's a

# Precision

"The Same as You Can Buy."

name of the machine means little—all standard engines are good. It is the name of the engine that counts. And if that name is "Precision" you are sure that you have the best engine that experience could build or money buy. Proof of this is given by facts (1) that many prominent manufacturers fit "Precision" Engines as Standard. (2) An ever-increasing number of riders specify "Precision" Engines only. (3) During the last 12 months as many as in open hill-climbing have been won with "Precision" Engines as with any other four makes.

One could wish for stronger proof. You can appreciate that it means everything to you if your engine is a "Precision."

Whatever use you propose putting your machine to, it is a "Precision" Engine which will do that work better than any other make.

Particulars posted upon request.

.... "more handy than a motor car  
more useful than a motor cycle."

Read how users speak of it—

July 12, 1912.

"I find the little vehicle a great advance on the various motor cycles with which I have had experience, and it embodies all the comfort of a fully fledged car. I have already reported to you the result of my journey from Birmingham to Norwich and back, when practically non-stop runs were made except for meals en route. The petrol consumption on the outward journey was  $3\frac{1}{2}$  gallons per about 165 miles running. . . . The control is splendid in traffic, and in emergency the tiller steering is more responsive than the wheel. . . . . You are welcome to refer enquiries to a satisfied user of your very practical machine.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.  
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.  
York and Lancashire.

SECTION III.  
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.  
Nottingham, Lincoln, Leicester, Rutland, Northampton, and Warwick.

SECTION V.  
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.  
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.  
Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants.

SECTION VIII.  
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.  
Somerset, Devon, Dorset, and Cornwall.

SECTION X.  
Scotland.

SECTION XI.  
Ireland and Isle of Man.

## THE BEST MACHINE AT LEAST COST

with promptest delivery, and the certainty of most satisfactory service, can always be obtained by a visit to.

# WAUGHOPES

WHERE THERE ARE ALWAYS OVER 300 NEW AND RELIABLE SECOND-HAND MACHINES IN STOCK, AND TO-DAY'S LIST INCLUDES:

5-6 h.p. 1912 2-speed F.E. F.N.	250 0
3 1/2 h.p. 1912 3-speed BRADBURY	250 0
2 1/2 h.p. 1911 ROYAL ENFIELD	227 0
5-6 h.p. 1908 4-cylinder F.N.	220 0
3 1/2 h.p. 1912 F.E. RUDGE	245 0
3 1/2 h.p. 1910 F.E. TRIUMPH	237 10
5 1/2 h.p. 2-speed BAT, 1911	242 10

## ASK FOR TO-DAY'S LIST.

See the BARGAINS for Cash. Send details of your used machine and receive our offer for same in part payment of a new one.

## NUMBERED ADDRESSES

For the convenience of advertisers, letters addressed to numbers at "The Motor Cycle" When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded with the advertisement. Replies should be addressed to the number, then to the number of "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of goods is three days, and if a sale is effected we return the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction carries one way. For all transactions exceeding value, a deposit fee of 2s. 6d. is charged, and the fee is 1s. All deposit matters are dealt with by "The Motor Cycle," 20, Tudor Street, E.C.

## SPECIAL NOTE.

Readers who reply to advertisements and answer to their enquiries are requested to refer to the advertisement as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to by post.

## MOTOR BICYCLES FOR SALE.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

6 h.p. 1911 N.S.U. Twin, 2-speed gear, with 239/10, or without sidecar £34.

3 1/2 h.p. Premier, 1911 model, in grand running order, 2 tyres practically new, new belt; a bargain.

3 1/2 h.p. Premier, 1912, only soiled, not damaged, Lucas lamp and horn; great bargain—Turvey and Co., The Motor House, Sunderland.

NEW 6 h.p. Royal Enfield Twin and Sidecar, for immediate delivery; admitted the finest machine in the trade; £84.

NEW 1912 3 1/2 h.p. B.S.A., T.T. model; £48.

NEW 1912 3 1/2 h.p. Humber, 2-speed; £52/10.

NEW 1912 3 1/2 h.p. Triumph, free engine; £50.

THE Above are offered as being unsold.—The sole agents for Humber, B.S.A., and Royal Enfield motor cycles—Write, wire, or by post, to The Motor House, Sunderland.

1912 Scotts, ready for delivery in 3 days; 3 free tuning.—Walker's, Fishburn, Fern.

1912 Triumph, 2-speed chain drive Bradbury 6 h.p. Enfields for quick delivery.—Walker's, Fishburn, Fern.

NEW Hudson, 3 1/2 h.p., 1912 model, as new; exchange for 1912 2 1/2 h.p. and cash.—Heron, Roman Rd., South Shields.

1912 Scott and Douglas in stock for immediate delivery, also three 2nd-hand 1911 Douglas, Archdale, Bishopston Lane, Stockton. Tel.: 254.

FOR Sale, Indian, 4 h.p., 1910, single-cyl., 1 hand, perfect; any trial; lamp, horn, watch, cyclometer, spare tube, and many spares, 3,000 miles; £30; buying twin.—H. O. Johns, Hutton Av., West Hartlepool.

### SECTION II.

York and Lancashire.

1912 P. and M., 3 1/2 h.p., immediate delivery, by Fred Lee, Pocklington.

DOUGLAS and Williamson motors in stock at Manchester agent, Goulray, Fallowfield.

FREE Engine B.S.A., late 1911, only run 800 miles, or nearest offers.—Wray, Postmaster, E.C.

CHATER-LEA Frame, everything except motor; bargain, £25, offers.—Bell, Wesley R. ningley.

BRAND New F.E. Rudge; cost £55; as complete delivery, will sell £49.—26, Ashton R. eambs.

MERRICK for Bradbury, Chater-Lea, Rudge, Matchless, etc.—Merrick's Stores, Lister Rd., 'Phone: 2439.

### Proposed Amateur Association.

THE attention of our readers has been drawn this week to an announcement made elsewhere in these pages of a proposition to form an amateur motor cyclist association to be composed only of *bona fide* amateur motor cyclists. We are asked by the promoters to invite criticism through the columns of *The Motor Cycle* on the formation of this association. Our own opinion respecting it is that there would be no necessity for a separate association of this nature if the Auto Cycle Union were fully alive to the very large number of so-called private owners or amateurs who compete weekly in events confined to private owners, but who in reality do not comply with the definition of a private owner laid down by the Auto Cycle Union. This question of amateur and professional is found in almost every sport under the sun. It is a most difficult problem, and the Auto Cycle Union as the governing body of the pastime has our very sincere sympathy in its dilemma. We are rather inclined to think that perhaps the A.C.U. has not been quite so strict as it might have been. Finding out who are trade supported and who are not was a problem which always gave the governing body of pedal cycling the greatest difficulty. History, therefore, is merely repeating itself in connection with motor cycling. We have no desire whatever to see amateurs separated from trade riders in competitions, but we most certainly think that when a competition is open to both there is something mean, underhand, and unsportsmanlike in posing as a private owner, especially when special prizes are offered for amateurs, and at the same time taking subsidies in some form or other from the manu-

facturer of the machine which is ridden, or of the accessories used. It is obvious that the riders do not do this to evade paying trade entry fees. Nor is it usually done to take an amateur's prize under false pretences. It is solely to secure undue credit for the machine ridden by the sham amateur.

### Are Motor Cycles Good Hill-climbers?

THE man in the street who is not yet converted to the pastime would ask this question in all seriousness were he to look over our shoulder as we dealt with the voluminous correspondence received in this office every morning at this time of year, mainly consisting of queries as to the best route from place to place. The extraordinary number of routes we are asked for avoiding the steepest hills is simply astounding. Often we are asked for routes in Wales, the West country, and even the Highlands "avoiding the steepest hills," questions which are just as futile as to ask how long such and such a route would take to cover when the unfortunate Editor is given no idea of the machine's capabilities.

Probably most of these queries emanate from users of under-powered machines, or, worse, single-g geared sidecar combinations. If only these riders could realise what they miss by wishing to avoid steep places they would take care to choose change-speed mounts or fit variable gears to their present machines. The six days' trial now being run off is severe enough, and too much credit cannot be given to those machines which perform well on the hills towards the end of the trial. These are the mounts which should remove this query as to how to avoid steep hills.

## INTERESTING CONVERSIONS.

ON this page we illustrate three conversions, which serve to show the need for a light low-priced run-about. At the present time there are very few low-priced machines which have undergone prolonged tests, so that quite a number of our correspondents have been exercising their ingenuity by converting old type quads and tricars to suit their requirements. Some of the resulting machines look smart and some emphatically do not, but in most cases they satisfy the needs of the proud owner-builder.

The reconstruction of ancient machines has many advantages, for many of them were of extremely sound construction, and the parts which have been proved to be satisfac-

cooled Stevens engine, three speeds and reverse gear box, and Chater-Lea frame fittings. These components have been redisposed and a new body fitted, with the result, the owner claims, that the machine is more comfortable, steers better, rolls less, and that the passengers get fewer road shocks owing to the improved position of the seats.

Mr. Yeo's conversion consists of an 8-10 h.p. tandem Rexette converted into a sociable and fitted with a stout hood.

The third illustration shows perhaps the most interesting machine, as it was originally a quad-car, built about 1897. In 1904 it was converted into a three-wheeler with forecarriage, in which state it ran till a year or

1.—An 1897 quad converted by G. Holme of Derby. 2.—An Invicta tricar converted by J. J. Holloway, Newhaven. 3.—A Rexette converted by J. Yeo, Merton.

tory by the test of time may be used for the new vehicle. On the other hand, faults in design will have made themselves obvious, and so can be easily rectified.

The case of Mr. Holloway's conversion is typical. The machine was originally an Invicta tandem tricar, fitted with a 7-8 h.p. twin water-

two ago, when the final alterations were started on. The power plant consists of a  $5\frac{1}{2}$  h.p. thermo-syphon cooled engine (the radiator is home made), fitted with an epicyclic two-speed gear. The body is made of three-ply wood mounted on a steel frame. Mr. Holme, the builder, is an amateur mechanic, and has carried out the work very creditably.

## A TRIAL OF A RUBY.

BY the courtesy of the Royal Ruby Cycle Co., Great Ancoats Street, Manchester, we have been testing a Ruby motor bicycle and sidecar on one or two severe hills in the Midlands. The specification of this three-speed machine includes  $3\frac{1}{2}$  h.p. single-cylinder J.A.P. engine, B. and B. carburetter, Bosch magneto ignition, Chater-Lea frame, Druid spring forks, and Sturmey-Archer three-speed hub gear. The firm, however, will fit Armstrong three-speed, Roc or Villiers two-speed, if required. The gear ratios on the machine we tried were  $4\frac{1}{2}$

to 1 top and 9 to 1 bottom gear, which are quite satisfactory on ordinary undulating roads, but if exceptionally steep hills have to be climbed we should recommend a slightly lower bottom gear ratio, particularly for heavyweight passengers. On ordinary roads the  $4\frac{1}{2}$  top gear renders the machine speedy, and the slow running of the engine is less irritating than exceedingly high engine speeds when used with a top gear of lower ratio, but 5 or  $5\frac{1}{4}$  to 1 top gear is really better for steep hills, as it gives a bottom gear of  $10\frac{1}{2}$  to 1, which makes climbing more certain.

## A Trial of a Ruby.—

Our first test was on Warmington Hill, which lies between Warwick and Banbury. Accelerating to a good speed at the hill foot, the machine went over half way on middle gear, and, with plenty of power in reserve, climbed the 1 in 7 gradient on bottom ratio. Having successfully climbed Warmington, we took the machine to Edge Hill, which is a very formidable climb for a  $3\frac{1}{2}$  h.p. engine with a total weight of  $6\frac{1}{4}$  cwt. This was the weight of the combination and passengers weighed on the Kineton Station weighbridge. The luggage carried included tea basket, two-gallon tin of petrol, and sundry tools and spares, such as rear cover, belt, etc.

The first attempt at Edge Hill proved a little too much for the comparatively high-g geared, heavily loaded combination, but even so weighted it was possible to get within 100 yards of the top. Without the passenger, but with the spares and luggage mentioned, the machine easily climbed as far as the awkward bend on the middle gear, and from there to the top on the low gear the throttle was never more than half-way open, thereby showing that with a slightly lower gear ratio it would have taken the passenger up. The engine power was not at fault. Unfortunately, we could not obtain a lower gear than 9 to 1 with the adjustable pulley fitted, or we should have tried what the machine was capable of with a 10 to 1 gear.

The sidecar is a standard Mills and Fulford with wicker body, and the usual Bowden controls are fitted

for carburetter, front brake, exhaust valve lifter, etc. The accompanying photograph shows Mr. C. Rigby and his brother mounted on the machine which was lent us. The former drives this combination in some of the motor cycle competitions held in the neighbourhood of Manchester.

A 3½ Royal Ruby-Jap and sidecar with its makers Messrs. C. and G. E. Rigby, as driver and passenger.

## Proposed Amateur Motor Cyclists' Association.

A Purely Sporting Body composed only of bona-fide Amateur Motor Cyclists.

**A** FEW weeks ago an announcement was made in *The Motor Cycle* that Mr. C. C. Cooke, late hon. sec. of the Herts County Ae. and A.C. (motor cycle section), with other motor cyclists, was interested in the formation of an amateur motor cycle association. Mr. Cooke now writes us that those interested have had several meetings in London, and at the last meeting the sub-committee appointed to go into the definition of an amateur completed their task. Below we give the constitution of the proposed new body, also the proposed definition of an amateur rider.

This definition is somewhat drastic, but the sub-committee are of the opinion that no half measures will meet the case from their standpoint, but if need be the meeting at a later date can somewhat modify the ruling. It will be noticed that three prominent motor cyclists are connected with the movement, viz., Messrs. A. G. Reynolds (an old A.C.U. committee man), A. P. Harding (another prominent A.C.U. member), and C. C. Cooke.

### CONSTITUTION.

1. Membership shall be open to ladies and gentlemen fulfilling the following definition of an amateur:

- (a.) A member must not be connected directly or indirectly with the manufacture or sale of motor vehicles, or accessories, or parts, used in conjunction with them.
- (b.) Must not be in the employ of any one in connection with the above, or receive any payment in money, goods, or other assistance for riding.

- (c.) Must not receive advantageous terms in the purchase of motor vehicles, their parts, or accessories.
- (d.) Must not be connected with the advertisement of motors or accessories, or a paid member on the permanent staff of any motor journal connected with trade or motoring.
- (e.) Must when competing under the rules of this association undertake to prevent the publication of his or her name, machine, and performance in the advertising columns of the press.

The promoters of the proposed body wish it to be clearly understood that it is in no way intended to compete with any other club or body, it being solely the intention to bring together a body of motor cyclists whose ideas are in agreement with the above, and who will support a national motor cyclists' movement on the lines of this definition for the furtherance of the sport of motor cycling.

A meeting will be held at an early date confined to those who are in sympathy with this object, and who also are willing to subscribe to the provisional objects of the proposed body. The date, place, and time of the meeting will be notified later. In the meantime, written application may be made to attend the first formal meeting, and may be addressed to any of the undersigned:

Mr. A. G. Reynolds, 10, Old Fillebrook Road, Leytonstone;

Mr. E. P. Harding, 56, Great Marlborough Street, London, W.; and

Mr. C. C. Cooke, North Mimms, Hatfield.

# Occasional Comments

By "Izion"

## Red Tape and Big Trials.

In these days of huge entries and tight regulations long-distance trial riding is becoming somewhat of a labour. The main aggravation arises from signing checking sheets; signing is necessary every few miles, and the sheets are often entrusted to a single individual, lacking in good manners and commonsense, who soon loses his temper when he is hustled by an impatient crowd of eager riders. In some trial long ago, of which I have stupidly forgotten the venue, signing was abolished; I was given a bunch of metal discs bearing my number, and I had to leave them at various points along the road.

Here is an idea for Mr. Loughrough to work up. Classification for first, second, and third-class medals complicates things, but the difficulty is not insoluble. As regulations stiffen, trial riding will be eschewed by sport-loving amateurs, unless some of the coils of red-tape are deleted, and the need to dismount every few miles and fight one's way through a surging crowd to an angry man at a small table is one of the chief nuisances at present.

## Speedometer Driving Shafts.

Of late I have been testing a variety of speedometers, and I should particularly like to warn the unwary against certain types which are made with a very light driving shaft and casing. The two or three makes which first catered for our needs were originally provided with very stiff and heavy shafts and casings, and in my ignorance I used to declaim against them, and deride the one-ideal engineer, who, having found a certain strength desirable for cars, employed a shorter length of the same stuff for cycles. But that one-ideal engineer was quite right.

A maker whose wares I have lately tested has gone too far in the other direction. His speedometer arrived minus any steadying straps, and I fitted it as sent. It made a merry jangle-jangle against the front half of my machine. I put on one steadying strap, and it still whisked about like a lambkin's tail. I put on three, and it responded by tearing them all to slivers. I have returned to my first love, with vows of eternal fidelity.

## Small Car or Cyclecar.

I was under the (apparently false) impression that the A.C.U. had defined a "cyclecar" under limitations of price as well as of weight and cylinder capacity. However that may be, cyclecars which sell at well over £120 without accessories are now regularly competing in motor cycle competitions and doing remarkably well. With complete road equipment the vehicles cost up to £150. For this price one can obtain several makes of small car proper, complete with all equipment—to name a sample, a 6 h.p. Rover with hood, screen, and lamps. What are the A.C.U. trying to do?

The £150 cyclecar and the £150 small car are practically identical in specification, except that the cyclecar is distinctly faster. If the A.C.U. is of opinion that the average small car is too slow, too heavy, and too steady, I have not a word to say, though it is scarcely the Union's function to guide development in that sphere. But if—as I imagine—the A.C.U. believes it is possible to create a class of four-wheeled vehicles, which shall be genuine cycles, and be differentiated from cars in price as well as in weight and horse-power, what is the £150 cyclecar doing in its competitions? By the way, some of these cyclecars are a public danger in some competitions, where they are driven rather "blue" to catch up time after minor stoppages. I dare say their brakes are all right, but I have seen them driven fast round blind corners, and they need a good deal of the road.

## Efficient Belt Shields.

I wonder no accessory factor has yet marketed an efficient belt shield at a reasonable price, standardised to fit half a dozen of the most popular makes. The number of all-weather riders is increasing, and for 15s. or so an excellent belt shield should be obtainable, if made in quantities.

Here is one of the motives which would inspire purchasers who are also owners of three-speed hub-gear machines, on which the intermediate gear is direct. The ratios of the gears vary according to the diameter at which the adjustable pulley is fixed. The series I should prefer would be, let us say,  $4\frac{1}{2}$ , 6, and  $8\frac{1}{2}$  for solo work—I know none better on a 500 c.c. engine; they meet all requirements, including saving belt and tyres on a clutch start, and the ascent of the most precipitous hills. But if the engine pulley be adjusted to these ratios, its diameter is ludicrously small, and the unshielded belt inevitably slips in a shower of rain or when there is the least atom of stretch, while a projecting fastener bolt will burr over the threads of an adjustable pulley reduced to this diameter, and render a punch and hammer necessary whenever the loose flange requires to be moved for a different ratio. *Per contra*, if the engine pulley be kept at a reasonable diameter, say 4in., the series of gear ratios, with the standard 18in. belt drum, is raised to  $3\frac{1}{4}$ ,  $4\frac{1}{2}$ , and  $6\frac{1}{2}$ . In that event the top gear is practically useless, and the bottom gear does not allow for a clutch start on single figure gradient, nor for the ascent of all hills, allowing for gear friction and occasional reductions of engine tune. In other words, without an efficient belt shield a three-speed gear is little else than a two-speed. Now these gears are selling like hot cakes, and almost everybody who buys one will sooner or later wish he had an efficient belt shield. By "efficient" I mean a guard which completely protects the pulley-encircling section of the belt plus the bottom run to the rear drum.

## QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Adjusting the Needle Valve of Carburetter.

(1.) I am using a Longuemare carburetter on my 24 h.p. cycle and I wish to adjust the needle. Can you inform me how much petrol it should contain before the needle drops and closes the valve? (2.) Does the engine suck up all the petrol out of the carburetter each time, or does it only suck up a certain amount?—W.G.

(1.) You should purchase a copy of "Motor Cycles and How to Manage Them"; in it are given several instructions for adjusting Longuemare carburetter or any other make. In your carburetter the petrol level should rise to the bottom of the conical orifice into which the spraying jet is screwed, that is about an eighth from the top of the cone. (2.) The engine sucks up the amount of petrol required for each charge. If it emptied the float vessel each time the consumption would be extremely heavy, as you could well imagine.

### Birmingham to Inverness.

Will you kindly tell me the best road to Inverness *via* Yorkshire from Birmingham, and the return journey *via* the Lake District? I do not mind hills, but specially wish to miss roads with bad surface and large towns.—C.P.W.

Your best route would be as follows: Birmingham, Sutton Coldfield, Ashby-de-la-Zouch, Loughborough, Nottingham, which you can skirt by turning right for Newark, Tuxford, Retford, Doncaster, Aberford, Ferrybridge, then through Barnard Castle, Middleton-in-Teesdale, Alston, Longtown, Lockerbie, Beattock, Abington Inn, Symington, Lanark, Carluke, Newmains, Cumbernauld Station, Denny, Stirling, Auchterarder, Perth, then through Dunkeld, Pitlochry to Blair Atholl, Dalwhinnie, Kingussie, to Inverness. You will find plenty of bad surfaces in Scotland which will be quite unavoidable. Your return journey, if possible, should be made down Loch Ness as far as Spean Bridge, branch off at Laggan shortly after Loch Laggan, after Dalwhinnie follow the same road by which you came until you reach Gretna Green, and go straight on to Carlisle, after which you branch off for Bothel and back *via* the shores of Lake Bassenthwaite, Thirlmere, and Windermere, joining the main road again at Kendal. Here you should return *via* Ilkley, Settle, Skipton, Otley, Harewood, and *via* the

Great North Road back to Birmingham. This would be better than going back to Birmingham through the West.

### Registration of Motor Tricycle.

I, a few days back, sent a cheque for £1 asking the Carlow County Council to give me a number for a Morgan runabout. They do not seem to be certain whether this should be as a car or cycle. The Act has two classes—1, motor cars; 2, motor cycles—and in the instructions for the size of number plates it states: "Motor tricycles or bicycles of a weight unladen not exceeding 3 cwts.; the dimensions of car number plates must be halved"—suggesting that tricycles come under the motor cycle registration. The Clerk to the Carlow County Council has asked me for a further opinion, and I have replied that I am putting the matter before you. I may add that Morgans do not exceed 3 cwts., and that they are fitted by the makers with cycle size number plates.—A.I.L.

If the machine does not exceed 3 cwts. it carries a motor cycle registration number and the registration costs 5s., also, having only three wheels, it needs only a £1 motor cycle local taxation licence.

### Taxation Cycles.

I should be obliged if will kindly enlighten me on following points: (1.) Is it necessary, on selling one's old motor cycle and buying another, to take out a fresh £1 licence? (2.) If posing two motor cycles are kept used alternately, is one compelled to have £1 licences for each? (3.) If a motor cycle is bought with a view to re-selling, is it compulsory to both £1 and 5s. licences?—D.B.

(1.) The local taxation licence, costing £1, entitles the holder to keep a motor cycle for one year. Therefore there is no necessity, when selling the machine, to take out a fresh local taxation licence. (2.) If you own two motor cycles and run them alternately, you must have a local taxation licence for each. (3.) If the motor cycle is kept not ridden at any time during the twelve months it is exempt from the local taxation licence, but if it is used once on the road during that period you are liable, unless it is being ridden to registration offices for the purpose of registration. The 5s. licence is a driving licence; only one is necessary. A motor cycle need not be registered if it is not used.

W. H. Elce and F. H. Arnett, winners of the eleventh short motor cycle handicap and ninth long motor cycle handicap respectively, at Brooklands on the 5th inst.

## Speed and Petrol Consumption.

**?** A question has been exercising several of your readers, which has ended in some very wordy arguments. This conflicting evidence does not seem to help us, so I am not going to take any less authority than your own to settle it in my own mind. Question—If a motor cycle had a thirty miles journey which was done in one hour, or done in two hours, which journey would consume the most petrol, *pariteris paribus*?—J.M.

A faster journey would consume the most petrol, and for this reason. The time in either case will make the same number of revolutions, but when travelling 15 m.p.h. the throttle does not require to be so wide open as when travelling at 30 m.p.h., consequently less petrol will be taken into the cylinders on each induction stroke, and as there are the same number of strokes the petrol consumption will be less.

## The Removal of Pulleys.

**?** I have just purchased a 1908 engine 3½ h.p. Triumph. I should be much obliged if you could answer the following questions: (1.) How can the pulley (Triumph adjustable) be taken off easily? (2.) How is an Albion adjustable pulley engine-shaft clutch fitted? Is there any way of fixing it to the shaft? (3.) Is the Triumph pulley or any ordinary pulley fixed on anything, such as a set-screw? (4.) When putting on the clutch, does the pulley go next the crank case or furthest out? I shall not have to fit it on myself, but the shop is merely an ironmonger's and cycle agents, and I want to know how to give the man directions for putting it on. (5.) Is it possible to get a road book map of Ross-shire and Inverness-shire in the book form, and, so, at what price?—R.F.

Why not take your motor cycle to a garage where engineers will handle it properly? It is unwise to entrust valuable machines to anyone who is not used to handling them, as considerable damage can be done by inexperienced hands. The pulley is removed in the same way as any other. Take off the nut, drive a couple of wood wedges between the crank case and the pulley (not too tight), then with a mallet-faced hammer strike the end of the crankshaft a smart blow, when the pulley should come off. In obstinate cases it is necessary to use a special tool with jaws which go behind the pulley. The tool is called a pulley lever. Most garages have one in use. The centre portion of the clutch rod is keyed to the engine-shaft in the same way as the pulley. The centre portion must be bored to the same taper as the engine-shaft, and must have the keyway accurately cut in it to suit the pulley. (3.) All pulleys are fastened by keys and keyways. (4.) The pulley must be fitted on the shaft so that the belt runs on the same line as before; that is to say the pulley on the clutch goes as the crank case as the ordinary pulley. (5.) "The Motor Cycle Route Book" includes Scotland, and can be obtained by our publishing offices, 20, Abchurch Lane, E.C.

## Valve Grinding.

**?** (1.) I should be grateful if you would kindly inform me as to the absolutely correct way in which to grind valves in. By this I mean the movement. Twisting the valve one way and back again is, I believe, wrong. (2.) Is there any preparation that can be smeared on the joints of a crank case to prevent a small leakage of oil, and also to close a small slit in an extra air tube fitted to the carburettor? (3.) Is there any advantage in fitting an extra long air tube to a Triumph 1912 carburettor? Does it increase power and save petrol?—A.C.

(1.) We have never heard the reciprocating movement described as wrong. In fact, Messrs. Brown Bros. Ltd., have just designed a special valve grinder which is designed to give a reciprocating movement to the valve. All you want to remember, whether you give a reciprocating or rotary movement, is to lift the valve occasionally from the seat to prevent scoring. This can be done by placing underneath the valve head two or three coils of an old inlet valve spring. (2.) The best preparations we know of to smear on the joint of a crank case when it is taken apart and reassembled is a light application of shellac varnish. If you want to stop a leakage on the outside without taking the crank case to pieces, seccotine might stop it. The same applies to the extra air tube of the carburettor. (3.) There is an advantage in economy of petrol, as it saves waste petrol dropping out of the extra air

inlet, and there is also a claimed advantage by reason of a slight forced induction, if the pipe is the correct length.

## Lights on Sidecars.

**?** (1.) Does a 3½ h.p. sidecar combination require, by law, a red light at the back for travelling anywhere in England, or is it optional? (2.) Does it require two lights in front?—T.W.T.

(1.) The sidecar combination is a tricycle, and comes under the motor cycle law with regard to taxation and registration, therefore no red light is required at the rear, but the front number plate must be illuminated on both sides. For your own personal safety it is advisable to carry a rear red reflex light. (2.) Two lamps are not required in front of a motor cycle by law, but again, it is advisable to have lights showing the full width of the vehicle for your own safety.

## EXPERIENCES WANTED.

"H.L.I.S." (Pembury).—1912 free engine Premier.

"G.M.C." (Edinburgh).—7 h.p. Indian two-speed and sidecar.

"E.A.I." (Workington).—Wilkinson "T.M.C." for solo work—wear, consumption, and speed.

"J.B." (Wigtonshire).—3½ h.p. Scott and 5-6 h.p. Kerry-Abingdon with sidecar.

"A.L." (Chatham).—2½ h.p. Royal Enfield, 2¼ h.p. F.N., and 3½ h.p. N.S.U. twin two-speeds.

Baroness de Laroche, the first lady aviator, who rides almost daily in the Bois de Boulogne, Paris, on her Motosacoche. She is usually accompanied by a faithful hound of the "police dog" breed.

# DECOMPRESSOR DESIGN.

By B. H. DAVIES.

**H**ISTORY repeats itself. Many years ago we of the old brigade were riding De Dion tricycles and-quads which possessed no valve lifters, and were started by the aid of "decompressors." The long handle of the compression tap was coupled by a rod to a tank lever, and the machine was started by pushing it along with this tap open. Instead of the raucous crackle which now betokens a ready engine, we used to hear a fierce spitting, and the power generated on this reduced compression was sufficient to propel the machine on the level without a rider in the saddle, provided the bore of the tap was small. Before long manufacturers increased the bore of these taps, to render machines more pushable, and an effective explosion was only procurable when the tap was shut.

## The P. and M. Decompressor.

The earliest firm to recognise the value of the decompressor was Phelon and Moore, Ltd., whose device has been fitted to the earliest models dating from 1902-3. The exhaust cam carries beside it an

Fig. 1.—The P. & M.

auxiliary cam of such a height that it does not normally touch the valve rocker, but can be made to do so at will by a simple action which interposes a slipper, and thus raises the exhaust valve slightly on the compression stroke. This is shown in fig. 1.

I am at present riding a T.T. single-gear Ariel, with  $3\frac{1}{2}$  to 1 gear, capable of a road speed of sixty miles an hour. Minus the decompressor, this high-gear, high compression engine would be impossible to start uphill, and could only be started on

Fig. 2.—The Ariel.

the level by running it along at twelve miles an hour; moreover, it could not easily be driven in traffic at less than 12 m.p.h.; neither could it be readily started up on the stand, as it has no pedals, and pulling the back wheel up is not a sure method when there is no cone in the carburetter, and

jet suction is adjusted for high piston speeds or

But as a matter of fact I can ride this machine round a grass-plot 15ft. in diameter with the engine firing regularly at 2 m.p.h. It will almost start while I am pushing it up steps into the house; it will always start from stone cold without priming or flooding. I walk it along at a speed literally no faster than m.p.h. It can be driven behind a flock of sheep without lifting the valve. I can start it on the stand by pulling up the back wheel with my forefinger. This is attained by means of a simple decompressor device included in the timing gear case. There is a small double pedal mounted on the crank case. When this is in the forward position it pulls down an additional exhaust valve rocker, which is then operated by the small dummy cam B (fig. 2). This causes the exhaust valve to open the least trifle on the compression stroke, and, by allowing part of the charge to escape into the silencer, reduces the usual force of explosion to a faint woolly bark, containing just enough power to propel the machine and rider at from two to eight miles an hour, according to the setting of the handle-bar levers. After the rider has mounted he tips the pedal back, and a spring lifts the additional valve rocker so that it clears the dummy cam B, and the primary cam A alone operates. Thus with this decompressor a racing engine can be started more easily and run more slowly than a standard engine touring machine. 8 h.p. single-gear machines with trencher pulleys would become as docile as kittens with the aid of this charming fitment.

Fig. 3 shows how an experimental device introduced under trial by the Triumph Co. attains the same result in a different way. This sketch shows a Triumph inlet cam cut in the web of the timing wheel.

Fig. 3.—The Triumph.

Fig. 4.

main inlet cam A is the full width of the cut-away web. The cam differs from the standard Triumph cam in that where cam A shades away into the web of the web C there is a small, low, continuing cam B, which is only half the width of the cut-away (see fig. 4, a section of the pinion through B C). When the rocker gets off cam A the piston is obviously starting the compression stroke, and the external decompressor lever settles whether the valve rocker shall fall on to the rim C or ride on the narrow cam B. Fig. 4 shows the two positions of the rocker as it rides the cam, the dotted lines being the position of the rocker when the decompressor is out of action. The control is very simple. The stud of the rocker

**Decompressor Design.—**

protrudes through the timing gear cover and is held up against it by a spring. A small toe-lever cam and spring blade enable the rocker to be held on to the cam B or pushed clear of it. In use this decompressor is exactly similar to the Ariel device. It is not being supplied to the public at present, but may figure on the 1913 models.

Fig. 4a.—Humber.

The Humber and Eclipse machines are also all fitted with decompressors as standard fittings, and the following description of the Humber device may be easily followed by reference to sketch (fig. 4a). It will be seen that when the small cam B is brought into action it strikes the arm A and so releases some of the gases on the compression stroke. The action is governed by a lever on the left handle-bar, and its action renders starting and traffic riding particularly simple.

**The Eclipse Device.**

The action of the Eclipse decompressor may be followed by reference to the appended sketch (fig. 5).

The valve tappet B is made with a rectangular projection B B, and is mounted in a guide A. The tappet is operated in the usual way by the valve lifting lever E. Side by side with this valve lifting lever, and on the same pivot, is mounted an auxiliary lever F which is operated by an auxiliary cam. When the hand lever is released the tappet guide A moves through 90° and carries round the tappet B with it, causing the projection B B to engage with the auxiliary lever F and release a portion of the mixture on the compression stroke. When the motor has started the hand lever is pulled up about half its movement, moving the guide and tappet into position, shown in the lower sketch, which gives full compression. Upon moving the hand lever still further

Fig. 5.—The Eclipse decompressor device.

it acts as an ordinary valve release lever, being prevented from falling beyond the full compression position by a suitable catch.

**Detachable Decompressor Devices.**

Two other models of decompressor are worthy of mention, since either can be fitted to any existing engine which possesses side-by-side mechanical valves, i.e., any engine which has a solid valve cap capable of being replaced by a spare cap drilled to take a sparking plug, for both these devices are threaded to take the place of a second sparking plug. The best known is produced by the Amac Co. It consists of a plug containing an internal double-faced valve, and the merit of the device consists in the rigidity with which this valve is pressed down on its lower face by irreversible toggle mechanism to make the device gastight when full compression is desired. When the decompressor action is desired a handle-bar lever lifts the valve up against its upper seating by means of a Bowden wire, and on the compression stroke of the engine a small percentage of the charge is allowed to escape past this upper seating and to emerge into the atmosphere via a hole at the top of the device. The other decompressor screws into a valve cap, and

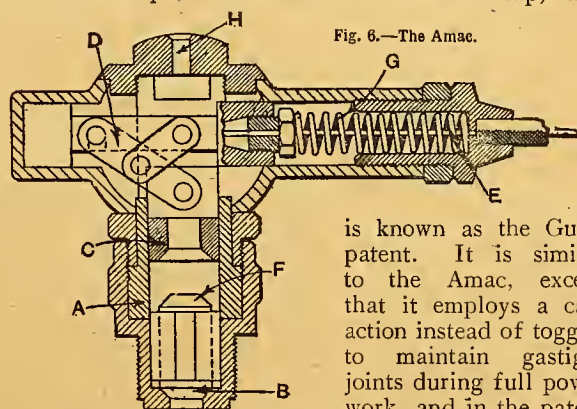

Fig. 6.—The Amac.

is known as the Guest patent. It is similar to the Amac, except that it employs a cam action instead of toggles to maintain gastight joints during full power work, and in the patent

specification it is controlled by a milled nut on the head of the plug, which would get unpleasantly hot in use, but, of course, Bowden control could easily be arranged. This decompressor is the subject of an illustrated article under the heading of Sparklets (see page 938 of this week's issue).

One other form of decompressor is on the market under the name of the P. and P. This device also screws into the valve cap, but works on quite a different principle, for whereas in each of the foregoing devices some of the gases are allowed to leak into the air, the P. and P. merely increases the compression space, and so converts a high compression engine into a low compression engine. The fitting consists of a chamber screwed into the valve cap, being normally sealed by a screw-down valve. When this valve is opened the gases can flow into the chamber and thus reduce the compression.

Fig. 7.—The P. &amp; P.

I regard these decompressor devices as by far the greatest convenience introduced during my experience of motor cycling.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### The Price of Motor Cycles.

Sir,—I think it is a capital idea to attempt to cater for the man of moderate and less than moderate means, but I would strongly advocate not going to the unnecessary expense of a magneto. As an experienced user of dry batteries, I have proved them to be as free from trouble as magnetos, one of which I have also had. Only the other day a young man asked me to show him my dry battery as he had never seen one. "Certainly," I replied, "it is in here," tapping the compartment. I added, "At least I suppose it is, but I have not seen it for over a month." Of course, we know that a rider nowadays feels sadly behind the times if he has not a magneto, but I think with a brand new machine this feeling would vanish.

JOHN H. RANDALL.

#### Starting with a Kick Starter.

Sir,—If Mr. S. J. Evans is riding an A.J.S. (which answers to his description of a single-cylinder 2½ h.p. chain-driven machine), he will find the best way to start is simply to kick the engine over the compression without lifting the exhaust at all. One vigorous thrust will do it, provided he takes care to get the engine in such a position that the full resistance of the compression is met with the kick-starter half-way down. This is easily done by lifting the exhaust a little and pressing the starter down once or twice.

I can always start from cold with one kick if petrol is injected *via* compression tap, or with two if it is not. The reader need not assume that my engine lacks compression; it is only that the foot-starter gives one a tremendous leverage.

SYDNEY J. TAYLER.

#### Oily Engines and Shorting Troubles.

Sir,—Permit me to reply to C. L. Mobray *re* an oily engine. He suggests fitting an extra crank case release. There is already an additional one to the hollow shaft. Surely another one is not necessary, making three in all?

With reference to the letter from the Bosch Magneto Co., I am very much obliged for their suggestion of paraffin waxing the high-tension wire, and shall certainly do so, although it is already a very tight fit. I tackled the makers of my machine, and they say that the magneto was not dismantled or interfered with in any way. Besides getting water in the armature tunnel, I was also troubled with same on the contact breaker, and the ring which holds the cam gets jammed after it has been in the rain, which necessitates it being taken out and rubbed with emery cloth. I still maintain that protection is necessary for bad weather.

GROWLER.

#### A Sidecar Experience.

Sir,—I was very interested in the account of the trial of the 6 h.p. Royal Enfield combination in the issue of the 1st inst., but I cannot help feeling that the article does not do this splendid machine justice. I found no trouble from the very first in starting the machine from a standstill on the low gear, and can do so on almost any hill. I have not had a single nut loose or lost in nearly 2,000 miles, and the consumption when I first got it was 72 m.p.g., but I have improved it by altering the jet in the Amac carburetter, and now do 80 m.p.g. over give-and-take roads. The machine has given absolutely no trouble whatsoever, and has done on a good level road, with sidecar and two up, 52 m.p.h. for three miles. I add the usual disclaimer, having no connection with the makers, but felt it a sort of duty to give my experiences.

WILTON HUDSON.

#### Youthful Drivers and Recklessness.

Sir,—Will you kindly permit me to enter a protest against the proposed action of the N.C.U. *re* the above heading? In my opinion, reckless drivers of motor cycles belong to no special class, but come from every class. Of course, only statistics of accidents can prove this, but reading the daily and motoring papers as well, I have seen very few accounts of accidents and reports of reckless driving attributable to minors. It would be very interesting to me to know on what basis the N.C.U. says, "Believing that youthful drivers are the worst." I do not think that the N.C.U. is a very sporting motor cyclists' union since it wishes to stop minors from riding.

H. MEDHURST.

[We take it that the N.C.U., which, by the way, is not a motor cyclists' union, does not wish to prohibit all minors from riding, but only wishes to raise the age limit slightly.—Ed.]

#### Power for Sidecar Work.

Sir,—On a former occasion I most strongly advised motor cyclists in hilly districts not to be taken in by the plausible tales of catalogues and interested parties. Amongst others my letter was replied to by Hugh Gibson, who said that he hoped to prove to us in Scotland that a hefty single was a reasonable mount even for us. Seeing this gentleman's name in the Scottish Six Days' Trials, I journeyed to "the ladder" behind Cockbridge to see how far "the hefty single" and sidecar would go before he failed. I knew him at once from photographs in your paper. He failed earlier than any of the crowd that passed. He tried all the tricks of the trade, clutch slipping, etc., and did all that man could do. No good. We closed round him and gave him the extra power that he required.

Now, sir, in saying, as we do, that 3½ h.p. is not enough for sidecar work, we are not to be understood as bigoted or unreasonable. With two or three-speed gears the little engine can do wonders. Who denies that it will plug up wonderful hills? It is not made for this double work, and is subject to endless ills and troubles when driven so long on so much throttle. Certainly, with those who can often change their machines troubles are not so apparent. They go down to the second-hand market. But with the rank and file of us, for whom you cater, our bicycle and sidecar are horse and gig and all combined. We cannot change them readily and cannot afford to over-drive or take the heart out of our machines. A twin is the only thing for us in Scotland, unless the passenger be a child. It is little short of criminal folly to persuade any poor fellow beyond the Grampians to buy a 3½ h.p. for passenger work; within the first year the engine will be a crock. There is, I think, a convincing illustration. Three gears are better than two, but a hundred are better than three. Instead of dropping into lowest gear where in a mile of heavy pulling the poor little engine goes purple and expires, the very last ounce and atom of 3½ h.p. can be got with the Gradua gear.

With twin 6 h.p. Zenith and sidecar I have done thousands of miles, all in the North, sometimes with heavy passenger, and beyond half an hour with punctures or a plug have never had a moment's anxiety. The machine is a joy and delight, built for its job and fit for its job.

It would be idle to add the usual disclaimer from the far North. I am only eager to save Northern brothers of the wheel from bitter disappointment.

EXPERTO CREDE.

**Short Measure of Petrol.**

Sir,—I was interested in what your correspondent "Fairness" had to say with regard to short measure in petrol. Might I offer the humble suggestion that a petrol can failing to give its full quota of two gallons of spirit is due to a tiny leak in the bottom of the can caused by the almost universal practice of opening the screw top of the can by means of the rim in the bottom of another? Why cannot the top be fitted with a bayonet catch instead of a screw? I don't think for a moment that the short measure is due to dishonesty on the part of the petrol manufacturer, but rather to the carelessness of the consumer.

W. W. ANDERSON, M.B.

**Motor Cycle Mania.**

Sir,—As an ordinary human motor cyclist, may I draw attention to a few of our brethren who would be better in a home than in the saddle.

Type No. 1, the man that will jog along thousands and thousands of miles, day after day, for months at a stretch, and then fill up the motor press with childish accounts of his absurd exploits. Such a one proves nothing, discovers nothing, and benefits nobody but petrol vendors.

Type No. 2 is he who purchases a  $3\frac{1}{2}$  and sidecar, gears it very low, invites his friends and relations to find seats on the various fitments of his combination, and proceeds to crawl up a gentle slope, takes twelve months' wear out of his machine, has his photograph taken, and hawks it round.

Third and last type, the much discussed "Filbert"; everyone knows him in town, but we don't see much of him when riding in the country. I wonder, oh I wonder why?

CHAS. H. GOULDEN.

**Petrol Consumption.**

Sir,—With reference to Mr. Eastgate's and other letters in recent issues. To run economically with a non-automatic or two-lever carburetter, the rider must not only have the skill that is acquired by long practice, but he must also give his air lever continuous and close attention. The average rider has not the skill, and does not take the trouble. Mr. Eastgate's enquiry specially referred to a 5 h.p. Indian, presumably with the Indian automatic carburetter.

In the petrol consumption competition of the Glasgow Motor Cycle Club on June 8th the writer rode a 5 h.p. twin Indian and his consumption is officially given at 111 m.p.g. This was a disappointing figure, as the machine usually does better than this, but still it was very good running, much better than Mr. Eastlake's fifty miles, in economy, power, and noise, for these other qualities are by-products of economy as it were.

This was obtained by using a Scott adjustable automatic carburetter. In this carburetter the choke tube and the automatic air inlet are so nicely adjustable that an approximately correct mixture can be obtained for all speeds and throttle openings, and as the adjustment is carried out while the machine is running on the road it is not guesswork but exact manipulation.

WM. G. B. SCOTT.

**Pillion Seats.**

Sir,—As a motor cyclist of some ten years' standing, and being able to cull from memory at least six accidents directly due to carrying extra passengers on the carrier of motor cycles, I marvel at the growing popularity of this insensible practice.

In the case of adults of both sexes, who are presumably alive to some extent to the risk they are taking, nothing can be said, except a word against the undue strain on the mechanism of the average motor cycle, which, of course, is not designed for such a purpose.

The reason of this letter is not so much to condemn the practice, bad as it is, of pillion carrying, but to draw attention to a glaring case of utter thoughtlessness and, in a sense, cruelty of a motor cyclist competing in a well-known London's club's reliability trials not long ago. This enthusiast, presumably with a desire to create some new record, brought a boy of twelve or thirteen years of age a distance of over 100 miles, only stopping for the times set out in the schedule, which, of course, were very short, and did not admit of nourishment being provided for the boy.

When he arrived at a well-known garage in —, the boy simply fell off the motor cycle in a state of utter collapse,

and it was at least ten minutes before he could really stand. The very grave danger is palpable, as had the motor cyclist gone another few miles the boy would have undoubtedly fallen off the machine, it being obvious that he was too weak and exhausted to retain his hold on to the driver any longer, who, by the way, I understand, was his father.

This seems to be carrying things too far, and I feel sure that all motor cyclists who really love the sport will agree with me that such an action is tantamount to cruelty of the worst kind, inasmuch as it endangers life.

G.W.

**A Six-stroke Engine.**

Sir,—I read with much interest and instruction what from time to time appears in *The Motor Cycle* as to the efficiency of the two-stroke and the four-stroke engine respectively, and it has frequently occurred to me "is it not possible so to construct a four-stroke engine that, on every alternate induction stroke, cold air could, at the will of the rider, be taken into the cylinder instead of gas, and that, on every alternate compression stroke, the air would be expelled without compression taking place?" It seems to me that any modern machine with a four-stroke engine of good make, on an ordinary give and take road, ought to travel at any pace up to 20 or 25 m.p.h. on an explosion on every alternate compression stroke, and that an open cylinder taking cold air every alternate suction stroke would mean a much better cooled and consequently much more efficient engine in every respect. I am not an engineer, but I have an enquiring mind with a mechanical turn, and so far as I can see there ought not to be much difficulty in designing a valve arrangement to give, at the will of the rider, an explosion either on every compression stroke or on every alternate one.

Should you think the subject worthy of consideration and investigation, probably you would give your readers the benefit of your views on it or invite the views of your correspondents.

EFFICIENCY.

[An arrangement somewhat similar has already been tried, and most successfully, on what might be called a six-stroke engine, the strokes being as follows: Suction, compression, explosion, exhaust, admission of pure air, expulsion of air or scavenging stroke.—Ed.]

**Built in 1905.**

Sir,—The enclosed photograph of a Lagonda tricar may interest you. The machine was built for me in 1905 specially to my requirements, with extra strong back wheel and Michelin car tyre. Although this machine was run

upwards of 10,000 miles all over the kingdom, I had only two actual punctures in the back wheel, but the front tyres suffered many a time. But (as you can understand and sympathise with me) the ignition, carburation, and lubrication proved a great source of trouble and expense.

C. GORHAM.

A new model 3 1/2 h.p. A.S.L., with 26in. wheels, similar to the one ridden by W. E. Cook in the A.C.U. six days' trials.

#### A Waterproofing Mixture.

Sir,—I seldom read *The Motor Cycle* without learning some useful tip. In a summer like the present the following will prove useful to "mudpluggers." To waterproof calico or canvas paint with this mixture; allow each coat to dry before applying the next: 1, Turpentine, five ounces; 2, driers, four ounces; 3, boiled linseed oil, one quart.

#### MUDPLUGGER.

#### L.C.C. and Driving Licences.

Sir,—It would be interesting, I think, to know whether any other of your readers have been treated by the L.C.C. in a manner similar to that in which I have been treated. On July 28th I applied in the proper manner for a licence to drive a motor cycle. I received it in due course, but it was a licence to drive a car or motor cycle. A few days later I received a letter requesting return of licence for alterations. I obliged, and on August 3rd I received my licence with "Licence Expired" printed over it, and a request that if I want it renewed I am too late, and must take out a new one. Fortunately, I have the receipt for the first one.

B.R.W.

#### Motor Cycle Insurance.

Sir,—Will you be so kind as to allow me to ventilate what seems to me to be an unfairness in the A.C.U. insurance policy? In the spring I took out a policy which I believed covered me in every possible way, as I was told it covered the machine and accessories (I paid £4 12s.). I was not told that the accessories were only covered if the machine was damaged as well. On re-starting my machine (a new one) I forgot to take out the clutch and ran into a lamp-post, doing 18s. worth of damage by smashing the lamp, but fortunately, as I thought, saving any damage to the machine: really I should have been better off by doing a few shillings' worth of damage to the machine, as I could then have claimed for that done to the lamp. Not till I wrote to the insurance company was I told that the machine must be damaged as well. Many of your readers who are insured may be under the same misapprehension. There seems no reason for this. It seems to me that the insurance company might easily safeguard themselves by stipulating that the accessories must be on the machine for the claim to be valid. I should be glad if any of your readers could tell me of a policy which does cover accessories. I would gladly pay a few more shillings to cover accessories, as it is an easy thing to damage one's lamp, horn, or belt-case, and yet save the machine. I shall certainly not again insure under the A.C.U. policy.

FRANK MATHEWS.

A copy of the above letter was submitted to Mr. Priestley, of the Liverpool Victoria Insurance Corporation, Ltd., through whom the A.C.U. policies are issued, and his reply is as follows:

Sir,—I thank you for allowing me an opportunity of answering the accusation of unfairness made by your correspondent.

I enclose herewith a prospectus, in which it distinctly states "Lamps and accessories are included under the Accidental Damage Section of the policy *when cycle is also damaged.*"

Surely this is quite clear, and should not lead to any misapprehension on the part of policy holders. The memorandum of endorsement (also enclosed) carries out the statement made on the prospectus, regarding lamps being covered "provided such damage is the direct and immediate result of an accident that at the same time causes the damage to some other integral part of the motor cycle itself (lamp brackets excepted)."

I have before me at the moment of writing specimen policies of the leading companies doing this class of insurance business, and each one contains the same condition.

If your correspondent would call upon me at my office, 199, Piccadilly, W. (presuming, of course, that he is resident in London), I will show him these specimen policies, and the same will no doubt interest him, seeing that, unfortunately, he has decided not to insure again under the A.C.U. policy.

A. H. PRIESTLEY.

#### Colonial Motor Cycles.

Sir,—As makers are probably thinking of new designs for colonial models, might I suggest the advantages of a hybrid between the four-cylinder F.N. and the two-stroke Scott as follows: Three-cylinder two-stroke engine arranged as on the F.N. with same transmission and gears, water cooling (thermosyphon with large diameter pipes), large waterproof magneto and distributor driven by gear wheels off crankshaft, forced lubrication, automatic carburetter, large combined flywheel and clutch, 26in. x 2 1/2 in. voiturette tyres, saddle and forks really well sprung, h.p. 4 to 5, gear ratios 4 1/2 and 8 to 1. This may sound rather a freakish monster and likely to be very expensive, but experience dearly bought goes to prove the necessity of something of this sort. For our work we must have weather proof transmission and ignition, high ground clearance, plenty of reserve power, and as little as possible to tinker with before and after a run. A machine built on the lines suggested would combine all the advantages of the two makes named while eliminating their few weak points.

Undugoda, Ceylon.

L. M. W. WILKINS.

#### SUMMARY OF CORRESPONDENCE.

Will the rider of a Scott and sidecar, "AK 18," kindly communicate with E. Williams and Co., Ltd., the Garage, Matlock Bath?

The rider of a Triumph who stayed at the White Horse Hotel, St. Ives, Hunts, on the 29th ult., is asked to communicate with Parker and Sons, Market Hill, St. Ives.

Will Mr. McAllister, who wrote to Glover Bros., Spon Street, Coventry, from an address at Stirchley, kindly send his full postal address?

The Editor would be interested to hear experiences of motor cyclists who have made use of the Tilbury-Gravesend ferry.

A. J. Dixon (3 1/2 Sinner) the only rider to climb to the summit of Porlock Hill in the M.C.C. Devon Tour. He is riding the same machine in the A.C.U. six days' trials.

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

**NEW PRECISION MODELS.**

F. E. Baker, Ltd., Moorsom Street, Birmingham, makers of Precision engines, have decided to add several new models to their list for 1913. These consist, be-

Method of fixing roller in valve rocking arm of 2 1/2 h.p. Precision.

sides the 500 c.c. Green water-cooled engine, of a complete range of the overhead valve type of engine, including a 2 3/4 h.p. 70 x 90 mm., a 3 1/2 h.p. 85 x 88 mm., and a 5.6 h.p. twin 70 x 85 mm.

We have inspected all these engines, and were struck by their neat and workman-like appearance. Special attention has been paid to the important and desirable feature of making the crank case oiltight. Mr. Baker points out that he wishes to introduce the overhead valve type as touring models and not as special racers. They have undergone strenuous tests and have proved in every way satisfactory. To back up his argument he took us for a run in his sidecar attached to a 3 1/2 h.p. engine of this type. A Sturmey-Archer hub was fitted having a top gear ratio of 4 1/2 to 1, and the power produced by this

Oil scoops or scrapers over flywheels of T.T. Precision engines

engine at low speeds was so remarkable that nearly all the thick Birmingham traffic was traversed on the high gear, and in the whole of our trip we failed to detect a knock. It is interesting to note that the cylinders of the Green engines used by Mills and Garret in the Tourist Trophy and at Brooklands have been in hard use for three years and are still in excellent condition.

We illustrate two new fittings on Precision engines. The first is a valve rocker from the 2 1/2 h.p. engine into which a roller has been inserted in an ingenious way. The roller is made in two pieces and riveted together. The fitting is easily explained by the sketch. The second device, which is fitted to T.T. engines only, consists of two scrapers fixed to the baffle plates between the cylinder and crankcase. Their object is to catch the oil brought round on the flywheels and throw it on to the cylinder walls.

**A NEW BROOKS SADDLE.**

J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham, are introducing a new saddle, designed to have a

parallel motion. Their well-known system of compound springing is retained, and these springs take all the weight, so that the system of levers used has no strains imposed on it other than those required to keep the saddle horizontal. It is worthy of note that the firm are making considerable extensions, so as to be able to cope with the increasing demand for their goods.

**A REAR LAMP LIGHTED BY THE MAGNETO.**

We recently had the opportunity of inspecting a very neat rear lamp lighted by the magneto in the following way. A small attachment carrying a carbon brush is fixed to the insulated part of the contact breaker; this brush makes contact during one of the two maximum positions of the armature, not used for ignition

purposes, with a brass segment carried in a fibre disc over the contact breaker. This segment is electrically connected by means of a small spring to the insulated terminal in the contact breaker cover, from which a low-tension current is taken to the lamp by means of an insulated wire. The lamp is furnished with a four volt bulb, and although the current is intermittent the glow is continuous, and illuminates the lamp in a very satisfactory manner. The device has been patented by Mr. C. W. Hinksman, 29, Upper Hanover Street, Sheffield.

**A NOVEL KICK STARTER.**

Riders of New Hudson machines with standard Armstrong gears know that to start the engine it is necessary to place the machine on the stand to start the engine.

A novel kick starter.

Bright and Hayles, a firm of motor engineers at 73, Church Street, Camberwell, S.E., have sent us a photograph of a kick starter they have fitted to a New Hudson machine, which enables the engine to be started with the back wheel on the ground. The firm state that they have simply locked the large nut of the adjustable pulley and cut on it a left-hand thread, on which is screwed a motor cycle free-wheel chain ring. The axle of the pedalling gear has been reversed to bring the chain wheel on the left side, and the chain shortened.

ENGLISH-DUTCH TRIAL. COMPETITORS CLIMBING DE GREBBE, THE ONLY HILL ON THE COURSE.

## SIX DAYS RELIABILITY TRIALS

*Taunton as a Centre*

**T**HIS is being written on Sunday, the eve of the great trial, which, as regards the number of entries, the organisation, and probable severity, will eclipse anything in the way of a six days' test the A.C.U. has ever

paratory work is now seen to be bearing fruit. Spaces are marked out in the big hall for each machine. These are not numbered, as the machines start and finish in different order each day; but the early arrivals are to fill the back places to allow room for those who come in later.

as possible, and to confiscate only those spares which, in the opinion of the judges, were unlikely to be carried by a private owner on tour.

A new model Triumph which is a T.T. roadster with free engine clutch and single gear. Observe the long silencer pipe with flattened end which is on all the Triumphs in the Six Days'. The machine illustrated is being ridden by H. Lister Cooper.

held. The drive from town on a  $3\frac{1}{2}$  h.p. B.S.A. was rather a hard one, as the westerly wind was dead ahead and several soaking rainstorms had to be gone through. That was yesterday. Today, though the weather is dull, the rain has held off and, in Taunton at any rate, we are all living in hopes of some improvement in this respect.

The official garage is the Territorial drill hall, and as an overflow for thirty-five machines which the drill hall cannot hold, the miniature rifle range has been brought into requisition, both of which

to perform. Major Nicholl took note of the equipment of each competing mount, Mr. Greenhill, aided by Mr. J. M. Trevarthen, worked hard with the sealing instruments, and Mr. E. M. P. Boileau the spare parts—a difficult and rather thankless task. The chief difficulty was in carrying out rule 14, which stated what might be carried in the way of spares, but did not specify what articles were forbidden. Eventually it was decided to interpret the rule as liberally

Passage ways are left behind, in front, and on each side of the rows, so that the public, who have access to the hall at night on payment of a small fee, may easily inspect the machines. In each garage there is a clock bearing the legend "Official time."

From 10 a.m. this morning work began in earnest. Major Nicholl, D.S.O., the Rev. E. P. Greenhill, and Mr. Archibald Sharp, the judges, each had their several duties

Operating lever of the Triumph decompressor, which may be expected as standard in 1913.

### A Weird Collection.

At the end of the day a weird collection of parts was made, which comprised several chain wheels, three piston rings and two complete carburettors off one passenger machine, a phosphor-bronze brake shoe, a gear cone, an almost complete dog clutch gear, an induction pipe and numerous spare petrol pipes. A blackboard on which the competitors' numbers are painted is placed outside the garages, and each morning as soon as it is time for a competitor to have his allotted quarter of an hour at his machine, his number is crossed off, and he is allowed to enter the garage.

He must not remain here more than fifteen minutes under pain of disqualification. Then he has ten minutes in the yard in which to replenish his tanks after doing which he must start.

### Weighing Operations.

Each machine was weighed this morning in the large garage. The scales were just inside the door, and all a man had to

Clutch pedal of new Armstrong three-speed side-car hub, fitted to 6 h.p. Brough.

buildings are, in part of the old county gaol. Outside there is a great yard bounded by unscaleable walls, while the only entrance is through an iron gate guarded by an ex-policeman who knows his job thoroughly. Credit for these excellent arrangements must be given to the Taunton M.C.C. and to Mr. T. W. Loughborough, whose excellent pre-

S. Crawley and the  $3\frac{1}{2}$  h.p. Triumph with Sturmey-Archer 3-speed gear.

do was to push his machine up a specially constructed ramp straight on

Spring box and arrangement of wheel springing on Jones sidecar fitted to one of the Matchless machines.

Complete magneto cover on the Scott machines.

Premier belt and pulley guard. It also covers the air release through centre of crankshaft.

Arrangement of force feed pipe from crankcase to carburettor on a 2 1/2 h.p. twin Humber.

D. F. Nicholl, whose excellent work the Union greatly appreciates, received his promotion only a few days ago. Valuable help is being given by the following members of the Taunton and District M.C.C.: Dr. Hles, Messrs Goldsworthy, Crump, H. F. Potter, J. Bermingham (sealing), W. J. Goodwin, G. F. Arnold, and G. Wright. The A.C.U. are distinctly fortunate in having such willing helpers at Taunton.

to the weighing machine, wheel it off, and take up his position ready for the officials to make their examination. This year the cylinders are sealed to the frame, and the only other sealed portions are the two wheels.

The sidecar machines were weighed at the gasworks under the supervision of Admiral Sir R. K. Arbuthnot, Bart.,

who is officiating as travelling marshal. Admiral Arbuthnot's promotion came just too late to allow him to enter, so he has kindly offered his assistance as an official to the Auto Cycle Union during the trial. Another officer, Major

## SOME OF THE COMPETING MACHINES.

**A**N examination of the competing machines leaves one with the firm conviction that great advance has been made in weather-proofing. Not only does this apply to the transmission, but equally to warding off foreign matter from the magneto plugs, and last, but not least, from the rider. Secondly, change-speed gears are practically universal. Those machines with single gears only are not regarded seriously as having a remote chance of completing the trial without loss of marks, if they do so much more credit to their riders.

Clutch pedal (Rex cone) and flattened silencer pipe (Rex cone) on 3 1/2 h.p. Bradbury, and on the Triumphs.

Altogether the competitors' mounts are very workmanlike lot. One or two can be styled freakish, and others have some rude arrangements of forced induction and other similar fakements, but, speaking generally, they are well finished, staunch, and reliable mounts, likely to give a good showing.

### Mechanical Features.

Dealing with the new arrivals, there is the Rolfe, a sturdy machine with twin precision engine, countershaft, and speed gear, and kick starter. A 1913 model Humber also makes its first official appearance, although we had an opportunity of examining it some weeks ago. It has a kick starter and Sturmey-Archer three-speed gear, and looks very attractive. As regards the Triumphs, instead of the one standard model usually entered for six days' events, we have in 1912 practically 11 possible types, including a three-speed countershaft geared model (which Haswell still drive), a two-speed countershaft, three-speed hub gears, plain direct drive,

and lastly Lister Cooper's T.T. model with hub plate clutch.

One of the Enfield sidecars, which model, by the way, is well represented, has a big undershield, which should effectively screen the magneto, engine, and gear. The O.K.-Precision possesses interesting points of design. One model has chain drive and a two-speed counter-shaft gear.

The A.J.S. are among the best finished machines in the trial, the three-speed passenger machine at once attracting the eye. This machine has a gear which is of the now popular counter-shaft type, with dog clutches for high and low ratios and sliding gear for the intermediate.

The Swifts and Ariels can be walked about the yard with the engine firing by the aid of the decompressor.

The buzzing Scotts are making a good show as usual and look spick and span. The trials machines have a double silencer arrangement and are particularly silent.

### Open Framed Machines.

The Swans are being watched eagerly. These machines have open spring frames and pan seats. The new A.S.L., with 26in. wheels, is very taking in French grey. A. H. Alexander is riding a blue single-cylinder Indian with two-speed

gear. The new machines to six day events are the Kynoch, which has a Sturmey gear, the Campion-Jap (with G. and H. gear), Wray-Precision, with

Effective dressguard on Mrs. Hardee's P. and M.

Bowden countershaft gear and kick starter, and the Corah-Jap, with P. and M. gear. The P. and M.'s are as clean and neat as ever, and are sure to be near the top at the finish. George Brough has fitted one of the new Armstrong sidecar gears to his 6 h.p. twin since the Scottish trials, his lowest ratio being 5 1/2

Competitors arriving at the Drill Hall, Taunton, for the weighing in and checking.

1. n.p. Iwin Swan ridden by Gurney. Note the open frame and pan seat.

J. S. Holroyd's twin cylinder Motosacoche with two-speed gear. A new model in the Six Days' Trials.

H. Mills (3½ Green-Precision water cooled).

to 1. The water-cooled Green-Precision which H. C. Mills is riding is conspicuous for its high frame, but there is no doubt about the power in the engine.

Miss Hammett (Douglas) and Mrs. Hardee (P. and M.) are to be congratulated on their pluck in riding in such a severe trial.

#### Green-Precision.

The 3½ h.p. Regal-Green-Precision is quite an interesting machine. The motive power is the 3½ h.p. 85 x 88 water-cooled Green-Precision engine. In addition to the honeycomb radiator incorporated in the copper water jacket, there is a supplementary tank provided with a large filler cap at the end of a tube, about 3in. high, carried forward of the petrol tank, the duty of which is to leave room for expansion. The frame has the top tube dropped at the rear in the usual way, but the supplementary stay is now duplicated laterally, and allows the valves to be easily reached. The two tubes of which it is formed more or less follow the contour of the bottom of the tank. The belt is guarded in front of the engine pulley and entirely enclosed on the offside. The gear is the Sturmey-Archer.

Norman Taylor (twin Yat-Jap and Millford sidecar), who claims to have beaten the six days' sidecar record.

There are several examples of the L.M.C., one with a combined chain and belt drive. An entry accepted after the programme had gone to press was S. J. Tessier's 8 h.p. two-speed Bat sidecar combination. Another Bat—a twin-entered by G. Babington, has an Armstrong gear, the first Bat with this gear we have seen.

The James mounts have the 1913 three-speed countershaft gear, and are bound to score in hill-climbing. Two of the New Hudsons have countershafts and combined chain and belt drives to enable big driving pulleys to be used. Holroyd's twin Motosacoche, with two-speed gear, is being eagerly watched, as this is a forerunner of a new 1913 series. It can be said without contradiction that the Zeniths and N.S.U.'s are the nearest to standard of any machines in the trial consequently their reliability is known.

The Quadrants are well represented, three of this make having three-speed hub gears. The Matchless sidecars look smart, and no hills have troubled them at the time of writing. Another passenger machine which greatly interests the West Country folk is the A.C., of which there are two examples.

Best guard fitted to A. G. Fenn's Humber.

3½ L.M.C. L.M.C. 2-speed gear with combined chain and belt transmission.

SCENE AT THE START ON MONDAY.

W. D. South (Rudge Multi).

W. Cooper (3½ h.p. Bradbury), Sturmer-Archer gear.

**First Day, Monday.**

Taunton, Teignmouth, Torquay, Plymouth (luncheon), Tavistock, Exeter, Taunton, 171½ miles.

Monday morning began well. The weather was fine but dull, and but for the fact that the glass had fallen during the night there was nothing to show that the first day's run would be on other than dry roads. At 7.30 the yard presented an animated scene. Early starters began to arrive and show a keen interest in the road on which the numbers were painted.

Mr. J. R. Nisbet, clerk of the course, assisted by Mr. Macnamara, who took the names, called out each man's number to the second. Everything was done in an orderly and businesslike manner. Just before starting time Col. Boles, M.P., M.F.H., arrived, having driven eight miles into Taunton for the express purpose of starting the leaders. The two early competitors were given the preference.

Mrs. Hardee, on being given the word to "go" punctually at 8 a.m. by Col. Boles, failed to make her P. and M. start, though Pratt had made the kick but perform splendidly five minutes before, so she had to be pushed off by rolling helpers. Miss Hammett (2½ h.p. Douglas), however, scorned assistance,

and on being started a minute later she made a neat running mount. Both ladies were heartily cheered. C. T. Newsome (Rover), No. 1, was next dispatched, and then Mr. Loughborough took charge of the start, sending off the men in numerical order. Frank Smith, who had had his broken sidecar spring repaired during the night, arrived just as the early starters were leaving. He was annoyed at the judges' decision to prevent him carrying his detachable wheel. The only entrants who failed to materialise were F. G. Boddington (7 h.p. Chater-Lea), F. Begley (3 h.p. Hazlewood), and W. H. Bashall (7 h.p. Bat and sidecar).

The early part of the run was over a not very smooth road to Blagdon Hill four miles from the start. The acclivity rises abruptly from the plain, and though the gradient is not unduly severe, the hairpin corner encountered about one-third of the way surprises those who do not know the hill. In these days of change-speed gears, however, little emotions of this kind are of no account, and the few observations we made on the hill justify these statements.

**The First Climb.**

The two ladies got up in good form, and after this the following competitors made clean ascents while we were watching the trial from this point. Fry (Quadrant), Scott (Rudge), South (Rudge), Wasley (Douglas), Drake, Pratt, and Shaw (P. and M.'s), who changed on the corner. Shaw, by the way, shows his contempt of superstition by accepting No. 13. Sproule (P. and M.), Sirrett (7 Indian), who made particularly easy work of the ascent, Alexander and Hill on similar mounts, Greaves (Enfield), Hardee (Triumph) had a little difficulty in changing gear, R. C. O. Wells also found his gear difficult to operate, Newsome, Crawley, Lister Cooper (Triumphs) came up in splendid style, as also did Moffat, Fletcher, Phillips (Douglas), and Newey (Bradbury). F. Dover, who had forgotten to lubricate his engine, dismounted, and one or two other failures are recorded. A. H. R. Purchase (Rolfe sidecar) experienced the first tyre trouble only five miles from the start. We then

rode on to watch the performances on Telegraph Hill. The remainder of the climb up Blagdon Hill was easy, and thereafter the road was good but narrow, and quite unsuitable for fast work until the main Exeter-London Road was reached a few miles east of Honiton. Near Exeter a turn to the left was taken which was indicated by a R.A.C. road guide. The Automobile Association men also gave valuable assistance at various danger points and doubtful turnings.

The route at this point was most complicated, but so well was the marking done that to lose one's way was a sheer impossibility.

**On Telegraph Hill.**

Telegraph Hill, which is on the main road to Teignmouth, is a long ascent with one hump in the middle, with a gradient of 1 in 7½ or thereabouts. Many of the more powerful singles took the ascent on top gear, while the lighter machines came up easily on their lower speeds. Among the newer machines we noticed the Swans, the 2½ h.p. twin Motosacoche, and the Rolfs to be performing well. Johnson (Kynoch) nearly came to a standstill through changing up too early, but the speed changing was

S. Brown (3½ h.p. James), James gear, on Blagdon Hill.

A. R. Abbott (3½ h.p. Bradbury), N.S.U. gear, changing speed on Blagdon Hill.

**A.C.U. Six Days' Trials.—**

done better here than at Blagdon, where the corner came as somewhat of a surprise. The only failure among the bicycles was that of J. M. Oakey (Matchless), through a high-tension brush in his magneto coming unscrewed. He had also had a puncture and other minor troubles at this early stage. Hubbard (Bradbury) was badly obstructed by a car.

**The Passenger Class.**

Though the hill was hardly steep enough to test the single machines, it was a good test for the passenger class. In this section the following made particularly good ascents: The two G.W.K. cyclecars, Colver (Enfield sc.), Jameson (Enfield sc.), Morgan (Morgan cyclecar), Frank Smith (Clyno sc.), C. R. Collier (Matchless sc.), the two A.C. Sociables, Guest (Matchless sc.), J. Tassell (Matchless sc.), A. J. Stevens (A.J.S. sc.), and V. Garland (Clyno sc.) J. R. Haswell (Triumph sc.) nearly stopped through changing down too late. The Duocar driven by De Peyncare came up well and then suddenly pulled up on the steep portion, and was in trouble for some seconds.

A mile or two after Telegraph Hill the first secret check was situated, but practically all the competitors were on time. A long climb over the moorlands gave us our first glimpse of the sea, but before Teignmouth was reached rain set in, and thereafter the run was rendered as uncomfortable as it could be. Oilskins and waders were now hastily donned.

Great interest is being taken in the trial, and crowds assemble in the towns and villages along the route. In Teignmouth the competitors dropped down a narrow street and had to round a hairpin which was obscured by a high wall. As several narrow escapes from falls occurred, Mr. A. H. Priestley took up a position here, but even his efforts did not prevent one man falling. This was G. Hunt (Campion) with whom the rider of the twin Swan collided. Torquay looked uninviting. The wet tramlines to Paignton were not relished, but the weather did not prevent a good crowd observing the ascent of the long winding hill immediately following the toll bridge.

Miss Hammett and Mrs. Harlee, the two lady competitors, waiting their turn to start.

On through Totnes the roads were fast becoming a mass of pools of water, and occasionally a competitor would be passed adjusting or changing his belt or cleaning the terminals.

**The Lunch Interval.**

Lunch was arranged at Plymouth, and but for the rain the morning's run would have been much enjoyed. The return to Taunton was by way of Tavistock and Two Bridges. The rain continued with unabated vigour, and it was difficult to see with rain being driven into one's face by the strong easterly wind. This was the more unfortunate, as the hills on this section are twisty and narrow, and low gear work was the order. Observers were posted at Two Bridges, but they were ornaments only, for every rider we saw

had no difficulty in accounting for the bend and 1 in 8 gradient.

**On Merrivale Hill.**

Up Merrivale Hill Mrs. Hardee came in splendid form on her P. and M., changing into second at the bad corner. Those behind her successfully negotiated the long grade in the teeth of the bitter easterly gale, which brought the low-powered machines down to low speed. All the way to Moreton Hampstead the unpleasant weather conditions continued, but after the latter place, where Lister Cooper, Arter, and several others stopped for petrol, the road, though very hilly, was more sheltered.

In the narrow winding road we overtook Phillip on his silent running Scott

A group of passenger machines which are taking part in the trials.

**A.C.U. Six Days' Trials.**

trailing a strap on the ground. At Longdown was a secret check in charge of Mr. A. V. Ebbelwhite (one of the official timekeepers), and near Exeter we saw Major Nicholl and several interested spectators observing a hill. The conditions were much better after Exeter, and near Taunton the roads were quite dry. Miss Hammett may be disqualified for receiving assistance in mending a puncture. Stanton had a broken front wheel cone, and was towed home by Mr. Loughborough. H. A. Cooper had similar trouble in his rear wheel, and broke the rear axle, and retired before Exeter. W. Cooper is missing.

The following also retired to-day: J. Slaughter (3½ New Hudson), R. Poole (3½ O.K.), Colin Macbeth (3½ Rudge), Fred Dover (3½ Premier), G. W. Ruscoe (2½ Forward), S. T. Tessier (7 Bat), and G. V. Moss (8 Autotrix cyclocar).

**Second Day, Tuesday.**

Taunton, Bampton, Barnstaple, Ilfracombe, Lynmouth (luncheon) (slow hill-climb), Countisbury, Porlock, Bridgwater, Somerton, Langport, Taunton. Distance, 160¼ miles.

The start was made this morning in fine weather; the only absentees were those whose retirements we have already mentioned in our report. Miss Hammett's case was heard last night, and the judge decided that, as no assistance could be provided, the matter could be dropped; her tyre had a huge cut in it, but she decided to continue on it to-day. The main road to Barnstaple was followed through Bampton. Near South Molton Gibb (Douglas) stopped to shorten his belt; Evans (3½ Humber) and Pratt (P. and M.) stopped for a clean up twelve miles from Lynmouth. Phillips (Triumph) was seen stopped by roadside three miles from Taunton, but incidents on this stage were fairly rare, except that Creyton suffered a broken valve lifter, and Wicker, who had sprained his wrist through a fall in Plymouth yesterday, had some difficulty in repairing a puncture. After we passed Barnstaple the main road was followed to Ilfracombe, after which the next point of interest was Parracombe, the steep climb out of which was narrow and difficult to negotiate; then came Beggar's Roost, the *pièce de resistance* of the morning's run.

**The Ascent of Beggar's Roost.**

The surface was rough, but at the side there was room for a motor bicycle. Those who did get up performed well, but failures were numerous. Those who made successful ascents and gained a bonus of 25 marks were C. T. Newsome, Sproston, Gray, South, Penny, Pratt, Shaw, Drake, Sproule, Hill, Greaves, Mrs. Hardee, W. F. Newsome, Crawley, Fletcher, Houghton, Newey, North, Pollock, Arter, Brown, Phillip, Baker, Longfield, Sawyer, Dickson, Dickson, Haddock, H. Haswell, Mills, Bees, Haslam, Heaton, Cook, Peachey, Watson, Holloway, Dibb, Griffith, Herdman, Soreby, Morris, McMinnies, H. Dixon, Oakey, Babbington, Wilberforce, Moss Blundell, Berwick, Little, Brough, Dixon, Evans, Wood, Keiller, Stevens, Frank Smith, Jameson, Creak Davis, Haswell, Morgan, and C. Collier.

This (Thursday) morning's route, 85½ miles.

A.C.U. Six Days' Trial. Total for the day, 154½ miles.

Up to the time we left the hill there had been no less than thirty-four failures, while exciting incidents were not uncommon. As Berwick was making a fast ascent, a car with two dogs following was coming down, and the plucky rider only missed one by a hair's-breadth. South only dismounted after being obstructed. Greaves came up fast with several others, who drove him into the side; however, he recovered quickly, and though he had to tackle the steepest and roughest part he made a wonderful recovery, and an absolutely clean ascent. Pollock also had a similar experience. Particularly fine ascents were made by Brough, Moss Blundell, Hill, and Haswell. The latter came up particularly well—a really fine performance for so small an engine. Though Beggar's Roost accounted for many failings, Parracombe also had its share. Many of these, however, were due to obstruction by four-horse waggons.

A curious incident happened during the morning's run. Greenhill's machine broke down, and Major Nicholl, with Sharp in his sidecar came upon him in his trouble and took him in tow, so two judges in a

sidecar towed in the other derelict motor bicycle. After lunch at the Lyn Valley Hotel, Lynmouth, the competitors proceeded to Countisbury for the slow hill-climb.

**FRENCH TRIALS REGULATIONS.**

All is not well with motor cycle regulations in France, judging by the letter published in *L'Aero*, and signed by Grapperon, a well-known rider in French competitions. M. Grapperon recommends competitors not to enter for competitions unless they are held under the regulations of the Automobile Club de France, and warns French manufacturers to be careful not to put machines on the market such as are used for racing purposes—a policy which killed the industry in France some years ago. He recommends that all machines should be sealed, that the weight of the driver should not be less than 10 stones, and that in the case of professional riders the name of the machine should be published, but for amateurs names only should be given. Cubic capacities and weights to be tested immediately after each event.

### Amateur Motor Cyclist Association.

We understand that the organisers of the proposed amateur association referred to this week have a promise of influential support from a very high social quarter.

### John Gibson's Recovery.

We are pleased to inform our readers that John Gibson, who was injured in the Isle of Man whilst practising for the T.T. races, is now quite recovered. He was reported to have been seen riding a motor bicycle at Stratford-on-Avon last week.

### English-Dutch Trial.

Owing to a slip last week we inadvertently referred to F. C. Wasley (2½ Douglas) as a trade member of the English team in connection with the above trial. As a matter of fact, Mr. Wasley is distinctly a private owner, his profession being that of a dental surgeon in Bristol and district.

### A New Venture.

It will come as a surprise to many to learn that W. F. Newsome, the well-known Triumph rider, will shortly resign his position with the Triumph Co., in order to open a motor cycle garage and agency in the East of London, in partnership with R. Fletcher. Everyone will wish the pair success in their new venture.

### Mont Ventoux Hill-climb. British Competitor Second.

The results of this French climb, held on the 11th, are:

	m. s.
1. Perrin (Peugeot) ... ..	26 43½
2. Vernon Taylor (Rudge-multi) 28 21½	
3. Dalny (Magnat-Debon) ... 28 53½	

In the lightweight class two Terrots were first and second. The winner of this class making the excellent time of 25m. 15s. It is only fair to state that the French machines were of a distinctly racing type. The record is 25m. 40s. made on a large twin-cylinder machine.

### 1913 Models.

The A.J.S. twin-cylinder sidecar machine of 1913 will have an engine of 74 x 84 mm., and three speeds instead of two. The wheelbase will be lengthened a matter of 2in., but the present style of transmission will be retained. The front forks will be of a stronger pattern, and a system of mechanical lubrication and an internal brake will probably be adopted.

The Premier Cycle Co., Ltd., who have for some weeks had a three-wheeled cyclecar under test, have decided to market a light four-wheeled vehicle, which will make its appearance in a week or two. The same company also have a new two-speed counter-shaft gear under test. It is expected to make its first appearance at the Olympia Show.

### Suse-Mont Cenis Hill-climb.

In this Italian event, contested on the 11th, riders of Motosacoche machines were first, second, third, and fourth in class one, 334 c.c. In the 500 c.c. class a Della Ferrara was first, and S.I.A.M.T. second. Fastest time 23m. 24½s.

### Six Days' Trials Notes.

The failures on less significant hills on Monday forecast an exciting day at Porlock next Saturday.

A. E. Catt claims to be the only competitor who is not carrying a spare belt, inner tube, or sparking plug.

A weak point of the regulations is that a competitor may make up lost time in case of trouble. This is leading to scorching after an involuntary stop.

Few will forget the ride over Dartmoor on Monday afternoon in the teeth of a howling gale, with rain coming down pitilessly.

So many entries having been received, the last man leaves after 10 o'clock, consequently he has to finish in darkness. This has led to much grumbling, as some of the passenger machines have to light up each night, and, to a stranger, night riding at 20 m.p.h. on the narrow and tortuous roads of Somerset is not to be recommended.

Forty-seven sets of tyres are running in the trials, entered by the Palmer Tyre Co. (3), Rom Tyre and Rubber Co. (5), Hutchinson Tyre Co. (28), Stelastec and General Syndicate (4), Wood Milne Co. (2), Leicester Rubber Co. (2), and J. Pedley and Son (3).

Practically every known combination of rubber studded, steel studded, and ribbed treads are in use.

The Service Co. entered a ¾in. Service leather belt, and J. Pedley and Son three belts, ¾in., ¾in., and 1in.

Vernon Taylor and his Rudge Multi on the summit of Mont-Ventoux on Sunday last.

### Motor Cycle Taxation.

In our last issue we pointed out that a very important legal decision regarding the use of motor cycles for trade purposes would be decided at Barnsley on the 9th inst. The case, was duly heard, Mr. S. Neuman, solicitor, Bradford, appearing for the Auto Cycle Union, and Mr. McGrath, Yorkshire West Riding Council, for the prosecution. After formal evidence had been given and after arguments, the justices found that the defendant's (Taylor of Skelmanthorpe) motor cycle "had not been constructed or adapted solely for the purpose of business," and fined him 10s. and costs.

It is possible that the Auto Cycle Union will appeal against this decision.

### Racing and Records at Glasgow.

At the Celtic Sports, Harry Martin attacked records for the Parkhead track on Saturday last. Off the mile standing start he knocked a second, bringing the time down to 1m. 14½s., while the three miles flying start he reduced by nine seconds, setting up the track record of 3m. 15½s. Martin rode his 2½ h.p. Martin-J.A.P., and an interesting event was the pursuit race between him and A. H. Alexander on a 2½ h.p. Douglas. The riders started on opposite sides of the track, and the race was for eight laps, or until one rider overtook the other. Alexander got away well, but Martin steadily overhauled him when once he got going, and passed in 2m. 34s., a result which was repeated in the second match.

### The French Grand Prix for Motor Cycles.

We have already announced that S. L. Bailey (Douglas) and Ivan B. Hart Davies (Triumph) have entered for the Grand Prix de France on the 25th inst. Since then a Triumph team has been arranged, the riders being H. Lister Cooper, W. F. Newsome, and H. Grahame Fenton. F. W. Barnes will also drive an 8 h.p. side by side valve Zenith-Jap with sidecar, P. Weatherill as passenger. F. C. North is another probable entrant on his 3½ h.p. Ariel, which he has tuned up to do 65 m.p.h. regularly.

The first sidecar entered will be driven by the president of the club, M. Chartier-Desvarennnes, who has entered a 7.9 h.p. Indian and sidecar.

The second is an 8 h.p. Matchless, which will be driven by a gentleman well-known to English riders, Mr. Melano, recently manager in London of the Hutchinson Tyre Co.

The Lyons M.C. will send their two best riders, De Baume (René-Gillet) and Vache (Magnat-Debon).

As regards the French riders, four René-Gillets and two more Triumphs have been entered. One of the Triumphs will be ridden by Gabriel.

# ENGLISH =DUTCH

# INTERNATIONAL RELIABILITY TRIAL

## With the British Competitors in the Netherlands.

**T**HE first international reliability test has been won and lost. Certainly it was not due to the weakness of the whole of the eighteen British competitors that the cup must remain in Holland, for whereas seventeen lost twenty marks collectively—eleven less than the Dutchmen—one English rider alone lost forty-three marks, and so it is easy to explain our downfall. It would be idle to hide the fact that the Englishmen expected to win easily, and all were surprised at the regular running of the opposing team on their F.N.'s, Eysinks, N.S.U.'s, Vulkaans, and Phonobiles. The Dutchmen thoroughly deserved their victory. They recorded fifteen non-stop runs compared with the British team's thirteen. Some consolation to Englishmen is derived from the fact that a Rover, James, and Douglas, appeared in the Dutch team.

### An Enjoyable Trip.

The outing proved most enjoyable. Saturday evening, the 3rd inst., saw over forty competitors and friends at Harwich watching with breathless anxiety their machines being swung aboard the *Copenhagen* in an open-ended cage, but nothing more serious than bent footrests and guards was the outcome of the crossing. Everyone admired the enthusiasm of the officials of the Dutch Motor Cycle Club committee, who rode from Amsterdam and were in waiting at the Hook to welcome their English guests at 5 a.m. Enthusiasm, in fact, characterised the whole of the arrangements. There was no such thing as too much trouble, the Englishmen were never left without a guide, there were

sufficient functions to keep everyone interested, and that is why we returned with such appreciation and respect for the hospitality of our Dutch friends. It took

A SCENE IN MARKEN.

F. C. Wasley, who would make a fine Dutchman, is seen posing with two Dutch peasant girls.

nearly two hours to trans-ship the machines and have them passed by the Customs officers, what time a cinematograph operator was busy.

After breakfast in the Hotel America, Mr. toe Laer, the president, headed the long procession of riders, and away we went for Scheveningen, the well-known bathing place. But the roads! We were all expectant of macadam surfaces which never came. Dutch roads are narrow and twisty, whilst the surface is composed of bricks very similar to tram setts. Holes deep enough to allow three or four of the bricks to be laid flat side by side existed every fifty to sixty yards, and so, instead of the Englishmen gazing around to study the scenery, as they are accustomed to do at home, all attention had perforce to be concentrated on the road to avoid a fall. Twenty miles per hour on such roads is ample. On this run we had our first glimpse of Holland. The scenery has an attractive and unique character all its own. It would be difficult to adequately describe the beauty of the lowlands, for the dykes, the windmills, the old-world costumes of the peasant girls were all so unique and quaint. It was this entire change of conditions that impressed the English visitors so much.

The visit to the Hague and Scheveningen, the fashionable sea-bathing place, was much enjoyed. After luncheon in the Kurhaus, the party dispersed in various directions to see the sights. In the afternoon, the competitors were kindly invited to tea at the Palace Hotel by Mr. and Mrs. Robt. R. toe Laer, where the party was photographed, and in the evening a move was made for Amsterdam (40 miles) *via* den Deyl, Haagsche Schouw. Oegstgeest. Hillegom. Heemstede, and Haarlem. The roads

still caused much discomfort and severely tested the machines. Our photographer broke the frame of his sidecar, one of Applebee's rear stays broke (he was carrying a third passenger on the carrier), and V. Taylor was seen with his cylinder off. Sundry bolts and nuts were found to be missing from several machines at the end of the journey.

#### A Thorough Wetting.

The entry into Amsterdam was not a dignified one, for it simply poured with rain. The competitors' machines were now filled with petrol and oil and locked up for the trial on Monday.

The rain-soaked riders requiring so long to change, the official dinner in the American Hotel, Leidscheplein, was unfortunately late, but the arrangements for this brilliant function were splendid. The majority of the representatives of both international teams were present, Mr. toe Laer occupying the chair, and welcoming the English guests. Speeches were in English and afterwards translated into Dutch. The respective captains, Messrs. Cooper and Pratt, appealed to the men to do their best and ride carefully and cautiously. In a subse-

quent speech by Mr. A. Citroen, the hon. secretary, a plaque of honour, in silver, and suitably inscribed, was presented to Mr. Geoffrey Smith (*The Motor Cycle*) in recognition of his services in connection with the arrangements for the trial in England. Suitable acknowledgment was made. It was after midnight when the competitors retired, and they were early astir, for at 8.0 a.m. the trial commenced.

#### The Trial.

The roads were little, if any, better. It was bump, bump, bump, and every 200 yards of comparatively smooth road was counterblasted by a jar sufficient to cause one's vertebrae to dither. Certain it is that bricks do not cause so much dust. Railway crossings are numerous in Holland. They are not guarded by swinging gates, but by a sort of collapsable gate which lifts vertically. To see it descending as one approaches the crossing is reminiscent of the Sword of Damocles. The first check at Soëstdijk caught a number of riders much too early, and in sight of the check balancing feats were the order. Practically everybody was too early, and as none of the milometers agreed with the

distance on the route card, a re-measurement was made, with the expected result, that it was found to be short, and two minutes were consequently allowed every competitor at this point. Unfortunately, three leading English contestants were outside this amount, and lost marks thereby. They were W. W. Douglas (Douglas), four marks; F. W. Barnes (Zenith sidecar), one mark; and F. Smith (Clyno), three marks. Slowing down to lose time, C. M. Down accidentally stopped his engine—bad luck indeed.

The lunch proved somewhat of a scramble. Here F. C. Wasley (Douglas) failed to put in an appearance until after the timekeepers had left, and lost the maximum marks (forty) in consequence. He experienced magneto trouble, the fibre of the contact breaker having worn so much that the platinum points would not break. The hopes of the British team were shattered thus early.

Public interest in the trial was most marked; at every street corner crowds assembled to witness the teams file through, and frequently cheers were raised. The ubiquitous boy scout pointed the way at all doubtful points. The regularity with which the Dutch com-

THE RESTART FROM APELDOORN AFTER THE LUNCHEON INTERVAL.

The first team : G. Smith (Humber), N. Ruyter (N.S.U.), and H. Dieters (Phanomobile.)

No. 4 team : E. Fischer (Eysink) and F. W. Barnes (Zenith).

**English-Dutch Reliability Trial.—**

petitors were running caused much surprise and comment; occasionally they would be observed repairing tyres, which did not involve loss of marks, and only three experienced trouble.

**Holland and its Hills.**

At De Steeg (81) riders dismounted to sign the checking sheet, then on again to De Grebbe (104½) for tea. De Grebbe is one of three hills in Holland. Its gradient had been kept secret, so the competitors were somewhat curious to know the worst. A standing start was made, and away the competitors were sent every twenty seconds to climb, not 1 in 4, but a gradient of 1 in 14, which most of them did in true English style! D. Croll, of the Dutch club, stopped his road wheels owing to a slipping clutch. Shortly after this, probably the prettiest stretch of the whole run was encountered. V. Taylor was passed by the roadside; his trouble remains a mystery. He was reported to be inflating a hard tyre. An unlucky experience befell Reg. Holloway hereabouts. His carburettor commenced flooding, and at last choked the engine. Pedalling his hardest, he kept the machine on the move whilst he unscrewed the float chamber cover, but had to give in at last and investigate matters. His trouble was a punctured float, which he adjusted temporarily and continued. It was generally agreed among the competitors that the rough course tested the machines as severely as two or three long days' runs over English roads. People turned out in thousands at Utrecht, where for the twentieth time during the trip the British National Anthem was played by a band.

**Impressions of the Final Stage.**

A few more miles of tramlines, several more railway crossings with the metals an inch or two above the road level, bridges approached at right angles, clumsy waggon drivers who would not heed the rule of the road, are recollections of the last stage of the journey. F. Smith (Clyno) punctured, and changed a wheel, which at first worried the officials, as they had not provided for detachable wheels on motor cycles. Another unfortunate Britisher was F. W. Barnes, who punctured his back tyre, but con-

R. G. Mundy (3½ h.p. three-speed Quadrant), who won a silver medal in the Dutch Trials as a reserve and is riding the same machine in the Six Days' Trials.

tinued on the rim. Near the end one of the cylinders of G. Smith's twin Humber commenced misfiring, but the machine was kept going on one cylinder for two or three miles, and by holding the terminal close to the top of the plug so that a spark gap was obtained, the carbon was burned away.

**Fine Performance of the Trade Team.**

All the trade team rode consistently and well, eight of nine accomplishing non-stops, and losing a total of 11 marks; The Dutch trade team lost 19 marks. The British amateurs had not such a good record, only five making non-stops, the total lost marks being 52; the Dutch amateurs lost 12 marks.

A big crowd assembled at the finish, the Darraq Palace, Stadhouderskade, Amsterdam (158½ miles). Subsequently the results were announced as follow:

WINNERS OF THE INTERNATIONAL TROPHY (presented by Messrs. A. Citroen and J. Ferwerda).—HOLLAND, marks lost 31.

**DUTCH TEAM.**

A silver medal was awarded for maximum number of marks.

N. Rayter (3½ N.S.U.), bronze medal.  
H. Dieters (6 Phonobile), silver medal, non-stop.

Hugo Smit (3 N.S.U.), b.m., n.s.  
E. J. E. Mass (5-6 F.N.), b.m., n.s.  
D. Croll, jun. (7 Indian sc.), b.m.  
E. Fischer (3 Eysink), b.m., n.s.  
P. N. Jelsma (2½ Eysink), s.m., n.s.  
D. de Roon (5-6 F.N.), b.m., n.s.  
F. Posno (3½ Rover), s.m., n.s.  
Jacq Fonck (2 Vulkaan), b.m., n.s.  
J. L. Geidt (6 Cyclonette), b.m., n.s.  
G. T. Arends (2 Vulkaan), s.m., n.s.  
D. v. d. Mark (2½ F.N.), s.m., n.s.  
J. W. Boots (6 Coronamobil), b.m.  
J. H. Nieuwenhuis (2½ Douglas), s.m., n.s.

Firma Eysink (2½ Eysink), s.m., n.s.  
C. Witteveen (3½ James), s.m., n.s.  
H. Daalmeyer (6 Cyclonette), s.m., n.s.

**ENGLISH TEAM.****PRIVATE OWNERS.**

Geoffrey Smith (2½ Humber), marks lost, 0, s.m.  
C. Maurice Down (2½ Enfield), 3, b.m.  
F. C. Wasley (2½ Douglas), 43, —.  
Vernon Taylor (3½ Rudge), 3, b.m.  
Fred Dover (3½ Premier), 0, s.m.  
E. Lester (3½ P. and M.), 0, s.m.  
W. Cooper (3½ Bradbury), 0, s.m.  
C. W. Wilson (Morgan), 0, s.m.  
A. E. Uffleman (6 Rex-Jap), 3, b.m.

**TRADE RIDERS.**

W. W. Douglas (2½ Douglas), 4, b.m.  
R. Holloway (2½ Premier), 3, b.m.  
Sam Wright (2½ Humber), 0, s.m.  
W. F. Newsome (3½ Triumph), 0, s.m.  
W. Pratt (3½ P. and M.), 0, s.m.  
J. H. Slaughter (3½ New Hudson), 0, s.m.  
Frank Smith (5-6 Clyno sc.), 3, b.m.  
F. W. Barnes (6 Zenith sc.), 3, b.m.  
F. A. Applebee (3½ Scott sc.), 0, s.m.

Three special cups were offered in connection with the trial. Messrs. Phelon and Moore's Cup for the best performance of a Dutch private owner resulted in a tie, and Messrs. Jelsma, Arends, Nieuwenhuis, Dieters, and Daalmeyer will compete again.

Negotiating one of the numerous bends. A Dutch boy scout is seen pointing the way.

A general group of competitors, English and Dutch.

At the foot of De Grebbe, the "test" hill which amused the British riders.

**English-Dutch Reliability Trial.**

The Cycle and Motor Cycle Manufacturers' and Traders' Union silver cup for the best performance of an English private owner may also be re-run in England, as five competitors lost no marks. They are Messrs. G. Smith, F. Dover, E. Lester, W. Cooper, and C. W. Wilson.

Likewise *The Motor Cycle* cup for the trade resulted in a draw, Messrs. Pratt, Newsome, Slaughter, and Applebee of the English trade team, and Messrs. Van der Mark, Eysink, and Witteveen, jun., of the Dutch trade team, qualifying for the award. Silver medals will be presented to each rider, and the destination of the cup settled in 1913.

**The Reserve Men.**

A number of chosen riders accompanied the teams as reserves, and, not being called upon, competed in a special section. Those who won silver medals for completing the course to schedule time are:

- R. Lord (6 h.p. Rex sidette).
- R. G. Muudy (3½ h.p. Quadrant).
- F. C. North (3½ h.p. Ariel).
- F. A. Hardy (2½ h.p. Norton).

Seymour Smith (3½ h.p. Norton).  
J. C. Bennett Mitchell (2½ h.p. Douglas).  
Eight reserve Dutch riders also won medals.

All the party met for dinner at the Krasnopolsky, Warmoesshaat, the same evening, and next day the much looked forward to boat trip to Volendam and Marken was enjoyed, a special steam boat being chartered. The band on board played the National Anthem as the steamer moved off, and as the boat approached the lock entry to the Zuider Zee a cornet player again obliged. Another anthem much in evidence was the British war-cry, "We're here, because we're here," etc.

The little fishing town of Volendam with its picturesque inhabitants in national costume was especially attractive to the English party in particular. The children especially looked most quaint in their old-world garb. A shop with Dutch clothing and clogs in the windows was too great a temptation for Dover, Slaughter, and Wasley; their example was followed, and the shop taken by storm. The men emerged one by one attired in clogs and huge trousers,

and seemed most concerned because they could not purchase a new pair of bags with patches on!

At lunch the English teams were the guests of the Dutch Touring Club, Mr. Fochema occupying the chair.

On the way back to Amsterdam the Isle of Marken was visited, and if the stay had been prolonged all money would have been spent, so anxious were the party to take back some souvenir of this delightful outing.

**Dutch Officials Entertained.**

In the evening the international trial was seen on the cinematograph at the Cinema Pathé. The film was not first-class, but it was cheered to the echo. Next morning, Wednesday, some explored Amsterdam, whilst another party, piloted by Mr. Citroen, started for Scheveningen. All met at the Hook about eight o'clock, and again getting the machines aboard, Messrs. Citroen and Ferwerda were entertained by the English riders to dinner, amid expressions of appreciation of the hospitality, kindness, and untiring attention of the Dutch Club officials to render the outing a thoroughly enjoyable one.

## CLUB NEWS.

**Torbay and District M.C.C.**

The second annual open hill-climb will take place on Saturday, September 14th.

**Essex M.C.**

The twenty-four hours' ride to York and back will take place on the 30th and 31st inst. Entries close on the 26th inst. All information can be obtained from Mr. H. Fuller, 51, Putney Road, South Woodford.

**Cork and District M.C.C.**

The result of the 100 mile reliability is as follows: 1, C. G. Pohlmann (3½ Rudge and sc.); 2, P. A. Egan (3½ Bradbury); 3, W. Sheehy (3½ Triumph). Pohlmann holds the New Hudson cup for a year.

**Derby and District M.C.C.**

A stiff course in North Staffs was selected for the Henmore Cup competition. Results: 1, H. Baker (3½ Triumph); 2, A. Ainsworth (3½ Rudge); 3, E. Horton (3½ Horton). There will be a hill-climb on the 17th inst.

**Glasgow M.C.C.**

A hill-climb was held on the 10th inst. The formula used was  $\frac{W}{C \times T}$ . The hill chosen was Garshake, near Dumbarton, a severe gradient without bad bends and of good surface. A. McCulloch (3½ h.p. T.T. Triumph) made fastest time. Result:

	Fig. of merit.
1. T. L. Rankin (2½ Singer) ... ..	100
2. R. Jones (2½ A.J.S.) ... ..	96
3. Graeme Taylor (3½ Rudge) ... ..	84

**Herts County A. and Ae.C. (Motor Cycle Section).**

The members' hill-climb, held on a hill near Northaw, on the 10th inst., resulted as follows:

**Division I.—Decided on time only.**

Class I. (machines up to 350 c.c.): J. Dudley (2½ Hobart), 22s.

Class II. (machines up to 500 c.c.): E. A. Colliver (3½ Zenith), 19½s.; H. F. Barge (3½ Rudge), 20½s.

Class III. (machines up to 750 c.c.): E. A. Colliver (3½ Zenith), 19s.

Class IV. (unlimited): E. A. Colliver (3½ Zenith), 19s.; G. S. Carter (5 Matchless), 20½s.

Division II.—Decided on formula, open to amateurs only.

Class VI. (up to 350 c.c.): Miss Walker (2½ Hobart).

Class VII. (machines between 350 and 500 c.c.): H. F. Barge (3½ Rudge); E. C. Jarvis (3½ Triumph).

Class VIII. (machines between 500 and 1,000 c.c.): C. M. Down (7 Indian).

**Mersey M.C.**

An open reliability trial will take place on the 31st inst. over a 200 miles course through Cheshire, Staffordshire, Derbyshire, and Lancashire.

**Finsbury Park C.C. (Motor Cycle Section).**

A hill-climb took place on the 5th inst. at Whitchurch, in Oxfordshire. The formula used was that recommended by *The Motor Cycle*,  $\frac{C \times t^2}{W}$ . Results: 1, R. Gordon Barrett (3½ h.p. Rudge); 2, C. F. Revell (3½ h.p. Triumph). The first named also made fastest time.

**Streatham and District M.C.C.**

The open hill-climb will be held on September 7th, within twenty-five miles of South London. There will be four classes for touring machines (with maximum weight limit), three classes for any machines, also classes for sidecars and cyclecars. The formula will be that recommended by *The Motor Cycle*,  $\frac{C \times t^2}{W}$ . In addition, the Greig Cup will be competed for by touring machines with variable gears up to 1,000 c.c. under the A.C.U. formula. Full particulars can be obtained from Mr. B. I. Simmons, hon. treasurer, 33, Poynders Road, Clapham Road, S.W.

**Dublin and District M.C.C.**

The markings and awards in connection with the reliability trial held from Dublin to Glengarriffe and back on the August Bank Holiday and succeeding day are as follows. G. Roche and F. J. Walker tie for the cup for the best performance, both gaining full marks all through, and will run off the tie over the sidecar trial course on August 31st. The holder, T. J. Dunphy, was knocked out on the first day of the trial by magneto troubles:

	Marks gained.		
	Open	All	
	controls.	controls.	
G. Roche (3½ Rover) ... ..	200	200	Tie for first
F. J. Walker (3½ Rudge) ... ..	200	200	place
T. E. Greene (3½ Rudge) ... ..	200	198	Gold medal
J. Doleman (3½ Rudge) ... ..	200	194	" "
T. Wood (3½ Ariel) ... ..	200	192	" "
R. Walshe (3½ Calthorpe) ... ..	200	191	" "

and £3 3s. for best sidecar performance

DONCASTER AND DISTRICT M.C.C. RELIABILITY RUN.

T. Drew (Triumph) and L. Bassett (Rudge) being started on the way to Whitby.

**Cumberland County M.C.C.**

The following revised result has been issued in Class IV.: L. S. Parker ( $3\frac{1}{2}$  Scott), time 34 $\frac{1}{2}$ s., takes third place with a figure of merit of .29, instead of B. Jeffreys (6 Bat), figure of merit .28.

**Cork and District M.C.C.**

A reliability trial took place from Cork to Dungarvan and back, a distance of 100 miles, on the August Bank Holiday. Eighteen riders took part in the competition, six of them having sidecars attached to their machines. The weather conditions were for the most part unfavourable. The chief prize of the competition was a challenge cup offered by the New Hudson Cycle Co., which was won by C. G. Pohlmann ( $3\frac{1}{2}$  h.p. Rudge and sidecar). The prize presented by the Hutchinson Tyre Co. was won by P. A. Egan ( $3\frac{1}{2}$  h.p. Bradbury), and the Egan Challenge Cup for the best performance by a novice was won by W. Sheehy ( $3\frac{1}{2}$  h.p. Triumph).

**Canterbury and District M.C.C.**

A hill-climb was held on Boxley Hill, Maidstone, on the 25th ult. The *Motor Cycle* formula,  $\frac{W}{C \times T^2}$ , was used in all classes except the slow climb. T.T. machines were penalised + 1 $\frac{1}{2}$ s.

CLASS I.—Any type of machine. Pavillet Cup Competition.

Place.	Rider and machine.	Time.	Result on formula.
1.	B. Martin ( $3\frac{1}{2}$ T.T. Rudge) ...	29 $\frac{7}{10}$ + 1 $\frac{1}{2}$	682
2.	G. Crump ( $3\frac{1}{2}$ Rudge) ...	34 $\frac{1}{5}$	605
3.	S. D. Timson ( $3\frac{1}{2}$ T.T. Rudge) ...	34 + 1 $\frac{1}{2}$	562

CLASS II.—There being no entries for this class, a class was run at the end of the day for those who had never won a prize for a fast climb, the day's fast climb winners also barred.

1.	G. Poxon ( $3\frac{1}{2}$ Bradbury) ...	34 $\frac{1}{5}$	534
2.	G. Buley ( $3\frac{1}{2}$ Triumph) ...	40 $\frac{2}{5}$	466
3.	A. Letchworth ( $3\frac{1}{2}$ T.T. Bradbury) ...	34 $\frac{7}{10}$ + 1 $\frac{1}{2}$	415

CLASS III.—Any type of machine, for members who have never won a prize in a club hill-climb.

1.	P. Kingsford ( $3\frac{1}{2}$ Triumph) ...	38 $\frac{7}{10}$	515
2.	L. Rawlinson ( $3\frac{1}{2}$ Trump-Jap) ...	36 $\frac{2}{5}$	493
3.	G. Buley ( $3\frac{1}{2}$ Triumph) ...	39 $\frac{1}{2}$	488

CLASS IV.—Slow climb (slowest up wins).

1.	G. Poxon ( $3\frac{1}{2}$ Bradbury) ...	117 $\frac{3}{5}$	
2.	G. Crump ( $3\frac{1}{2}$ Rudge) ...	114 $\frac{1}{5}$	
3.	B. Martin ( $3\frac{1}{2}$ T.T. Rudge) ...	105	

CLASS V.—Any type of machine (standing start).

1.	B. Martin ( $3\frac{1}{2}$ T.T. Rudge) ...	38	468
2.	G. Crump ( $3\frac{1}{2}$ Rudge) ...	40 $\frac{4}{5}$	424
3.	G. Poxon ( $3\frac{1}{2}$ Bradbury) ...	42	355

Boxley Hill is rather more than 500 yards in length, and the worst gradient is 1 in 5.75.

**Essex M.C.**

A gala meeting will be held at Brooklands on the 17th inst. The following events have been arranged: Sidecar race (2 laps, about 5 $\frac{1}{2}$  miles); Short cycle race (3 laps, about 8 $\frac{1}{4}$  miles); Long motor cycle race (5 laps, about 13 $\frac{3}{4}$  miles).

**Manchester Hundred M.C.**

A hill-climbing competition will take place, for both cars and cycles, on August 25th. Hill to be chosen by committee and members apprised three or four days before day of competition. A gymkhana will be held at Hoo Green on August 31st.

**Coventry and Warwickshire M.C.**

Already a good number of entries have been received for the open hill-climb on Saturday, August 31st, and in view of the fact that hill-climbs have been less frequent of late, an entry up to the usual standard of the Coventry Club is expected. We are requested to point out that Junior T.T. machines may compete in Class IV., which is for T.T. machines up to 500 c.c.

**Hampshire v. Surrey.**

An inter-county hill-climbing contest will be held on the 28th inst. Competitors will meet at South Harting village square at 3.30 p.m.

There will be five classes, each subject to a minimum of four entries in the class, viz.: Class I.—Up to 350 c.c. Class II.—Between 350 c.c. and 500 c.c. Class III. (unlimited).—Open on formula. Class IV. (unlimited).—Open on time. Class V.—Sidecars or cyclecars.

The results, except in Class IV., will be decided on the formula:

$$\text{Figure of merit} = \frac{W}{C \times (1 - 2t)}$$

where: W=Total weight of machine and rider in lbs.

C=Capacity of engine in c.c.

T=Time of ascent in seconds.

t=Time of fastest ascent of the day.

The winning side will be the one whose best twelve performances on formula show the better average figure.

**Harrogate and District M.C.C.**

The petrol consumption trial which, in the first place, was abandoned owing to the terrible weather, was run on Thursday evening last in wet and windy weather, which somewhat interfered with the entries; nevertheless two classes were run. Results:

CLASS I.—For Solo Machines.

	Fig. of merit.	m.p.g.
1. W. E. Grange ( $3\frac{1}{2}$ Bradbury) ...	11.8	100.8
2. T. C. Atkinson ( $3\frac{1}{2}$ Triumph) ...	11.7	154.6
3. W. Fawcett ( $2\frac{1}{2}$ A.J.S.) ...	9.4	132.5

CLASS II.—For Passenger Machines.

1. C. A. Nettleton ( $3\frac{1}{2}$ New Hudson sc.)	12.0	70.3
2. G. Hill ( $3\frac{1}{2}$ Scott sc.) ...	9.3	76.06
3. W. Atkinson ( $3\frac{1}{2}$ Scott sc.) ...	6.8	50.4

The course was a give and take one of twenty-nine miles. The formula used was weight carried divided by petrol used; artificial weighting was allowed.

NEWCASTLE AND DISTRICT M.C.C. TWO DAYS' TRIAL.  
T. Cooper (Triumph), G. W. Roper ( $2\frac{1}{2}$  h.p. A.J.S.), and S. Dodds (Singer), waiting for the word to start on the second day at Harrogate.

## WEAR OF BIG END BEARINGS.

FROM readers criticisms in the correspondence columns of *The Motor Cycle* there appears to be a considerable amount of interest engendered on the above subject, showing there is ample room for improvement in this direction. The solution to this problem appears to the writer to be not very far distant for the following reasons:

It may be taken for granted the excessive wear on any bearing is occasioned by, first, the excessive load in relation to the area of contact of the frictional surfaces squeezing out the film of separating oil; secondly, the quality of metal used for such surfaces.

One factor that influences the excessive load is the hammering action that takes place owing, not only to the explosive force behind the piston, but also to the reciprocating action of the piston and connecting rod.

Perhaps it may interest manufacturers and users to know that I have in my possession a De Dion engine of 1 3/4 h.p. that has run on the road a distance of some 28,000 miles, and during the whole of that time has run with the same bush in the big end of the connecting rod, no adjustment of any kind having been made. The secret, however, lies in the fact that the area of contact of this bearing is nearly three times greater than many engines of the present day of considerably more power.

Referring again to the reciprocating action of the piston and connecting rod assisting in the excessive wear of the bearings, it must be obvious, if we can make these parts lighter, we are not only going to reduce the wear but also increase the speed.

### A Light Steel Piston.

Some little time ago the writer took the trouble of making a mild steel piston out of the solid, and it weighed, when completed, some nine ounces less than the one it replaced. This alone added some four miles an hour to the speed of the machine.

Now mild steel pistons have proved in many instances a failure, because at high temperatures they do all sorts of things, but let those who have failed try the following tip: Case-harden the piston before grinding for the final fitting to the cylinder. Naturally, it must not under any circumstances be quenched so as to make it hard. The process has two very necessary results—it consolidates the metal and prevents warping at high temperatures, and also, what is equally important, it adds that percentage of carbon to the steel necessary for its wearing qualities. The piston mentioned above was treated in this way and has run some 3,100 miles, and shows no sign of wear and has given every satisfaction.

One advantage that follows from a piston made of mild steel is that it is unnecessary to make any fixing for the gudgeon pin. The pin can be a very tight fit, as there is very little fear of cracking the piston—the only necessity is that in hammering in the gudgeon pin care should be taken that the piston is not bent in any way, and for this purpose a jig is necessary.

It will be noticed that this also saves a little more weight.

So much for lightening the reciprocating parts. We now come to the other question, viz., the material of which the frictional surfaces of the connecting rod are made.

The well-known firm of Vickers, Sons, and Maxim lately introduced a new metal which they call Duralumin, and state its strength is that of steel, and weight very little more than aluminium, and in their announcement they show an illustration of a forged connecting rod of this material, and if this metal will stand the heat of an air-cooled engine it seems to me ideal for the purpose.

In a most interesting presidential address given by L. A. Legros, M.I.M.E., before the Institution of Automobile Engineers on October 11th, 1911, he referred to the improvements in materials of construction, and stated "that there were, however, certain possibilities in the case of steel which may yet have to be considered. It has been found that metallic tantalum has very great hardness and power of resisting wear by abrasion. It is recorded that an attempt to drill a tantalum sheet by means of a diamond drill run at 5,000 revolutions per minute for seventy-two hours resulted in a penetration of the metal to the extent of 1/4 mm. only, and was accompanied by considerable wearing of the diamond tool. Now if we suppose that the surface of a prepared piece of steel could be treated with tantalum in the same way as it can be treated with carbon in the ordinary case-hardening operation, and that, in fact, it could be superficially coated with a firmly adhesive coating of metallic tantalum, it should be possible to reduce any bearing surfaces so treated to dimensions hitherto unapproached under the heaviest loading."

This appears to be a peep into the future, but I am not altogether sure it is very far distant. At any rate, I think what has been written above will show that makers are much alive to possible improvements.

LEONARD R. JONES.

## WHAT I SAY

GENTLEMEN,

I have introduced several designs and improvements that have set the fashion in motoring. I have given to motor cyclists the true Two-Jet automatic carburetter. I have been experimenting and making carburetters for fifteen years, and I do not believe it is possible to make an automatic carburetter as good as mine by the use of a single jet; the reason is obvious—no carburetter is any good that does not provide a fierce rush of air past the jet; if you have this fierce rush past a single jet it will draw far too much petrol out. In the Binks this fierce rush is past a tiny jet which gives you an instant start, a slow pull, a "tick" round, then when you want more power you automatically direct most of this rush of air past a larger jet, and as the suction increases on the large jet it automatically decreases on the small one, giving you a perfect mixture at all speeds. On any decent machine on which it is fitted you can saunter along dead slow and get the most violent acceleration by slamming the throttle wide open. Just consider my magnificent collection of testimonials, every one unsolicited, from the Aristocracy, Clergymen, Doctors, Lawyers, Racing Men, and Tourists. There is an automatic boom coming on; do not be let down by experiments. Profit by my experience. Get the best, viz., the Binks Two-Jet automatic, it is the only way.

Yours truly,  
C. BINKS.

## WHAT USERS SAY

LANCASTER, April 17th, 1912.

Dear Sirs,—The carburetter arrived by post this morning, and I put it on at once, and have to-day had the most enjoyable run I have ever had on my 8 h.p. "Matchless." I could not believe a carburetter could make such a difference. It works most beautifully when running slowly and picks up in the most wonderful way. I put 4 jet in the pilot and have kept the 6 in the main jet, and could not wish for better results.

However, I will try various jets, and if I can make an improvement will be more than satisfied. I shall certainly recommend them to my various friends.

Believe me, yours faithfully, W. H. S.

40, West Blackhall Street,  
GREENOCK, July 26th, '12.

Dear Sir,—I am writing you to express my satisfaction with the carburetter you supplied recently for my 6 h.p. twin Rex. I have given it an exhaustive trial, and it does all you claim for it. The flexibility is such that now I can negotiate all traffic on my top gear, whereas I had to use the low before. I use a No. 3 jet in the pilot, and though not so easy to start with from cold as a No. 4, it is just the thing when running at speed, and the machine runs 24 to 30 m.p.h. on the flat without opening the main jet.

When I bought your carburetter I did not expect to find any improvement in petrol consumption, and I am surprised to find that I can average 70 miles per gall. I could not get much over 50 miles with my old carburetter. My last run of 65 miles was done at the rate of 73 miles per gall. The addition of your twisted handle makes an ideal method of control.

The silencer you supplied to my order fitted without any trouble, and the noise of the exhaust is now scarcely audible. There does not seem to be any back pressure as I cannot detect any difference in the running of the engine, whether the cut-out is open or shut.

I am recommending your carburetter to my acquaintances. Thanking you for your courtesy,  
Yours faithfully, FRANK HALL.

The originals of above, together with hundreds of others, may be seen at the works.

# WOODMILNES

## Splendid Results in 20,000 Mile Test

With already 16,000 miles completed Mr. Harry Long, who is attempting 20,000 miles on Woodmilne Tyres in six months with sidecar and passenger reports

**ENTIRE ABSENCE of TYRE TROUBLE**

Surely testimony to think about and profit by! These 16,000 miles include the English and Scottish Coast Trip with its long stretches of broken road

ent of the R.A.C. through the A.C.U. We are enabled to reproduce the permit issued to them by the Turkish Embassy, which is quite interesting, as it is written in the Turkish language. Several motorists have before attempted to reach the Turkish

### Change of Address.

The Rich Patent Detachable Air Tube Co., Crawley, has removed to larger and more spacious premises on the main London-Brighton Road.

### Motor Cycle Makers who Ride.

It is unfortunately not all makers of motor cycles who ride their machines. Messrs. W. and S. Hazlewood, of Hazlewoods, Ltd., however, are firm believers in the motor cycle as an aid to business. One of these gentlemen uses his 2½ h.p. Hazlewood lightweight for travelling in the Southern and Western counties, while the other is a director and works manager, and uses his machine a great deal. Both are heavyweights, but find the three-speed gear enables them to climb all hills.

### Scottish Trials Notes.

Of five entrants who used Pedley tyres in the Scottish Six Days' Trials, four obtained gold medals and one a silver medal. Mr. White, who obtained a silver medal, lost time owing to a broken wheel. Six entrants used Pedley belts; five obtained gold and one a silver medal, Mr. White being again the only man who lost time.

The Dunlop Pneumatic Tyre Co. claim that more successes were gained on Dunlops in the above trials than were credited to any other make. Ten gold medallists used Dunlop belts, and five gold medallists used Dunlop tyres, whilst many lesser awards in the shape of silver and bronze medals were credited to this firm.

It is worthy of note that in the Scottish Trials awards three of the special prizes were awarded to riders of chain-driven machines fitted with Hans Renold chains, viz., the private owner's award to McMillan's Scott, the trade rider's award to W. Pratt's P. and M., and the team prize to the Indian team.

### A Smart Showerproof Suit.

The smart motor cycling suit illustrated is a new garment, called the Showerdust, introduced by A. W. Gamage, Ltd., of Holborn. The cloth from which the suit is made is specially manufactured for Gamages. It is, we are told, far more durable than rubber, much smarter in appearance, and more comfortable to wear. The jacket is cut easy and full, and by buttoning close up to the neck affords complete protection against dust. There are also wind cuffs in the sleeves. The overalls are made with only one fastening, which buttons on to the breeches button; while at the foot they are fitted with a broad elastic band, which goes under the boot. This gives when pulled over the boot, and holds the spats down more firmly than the ordinary leather strap.

## SPARKLETS

### A Neat Valve Holder.

Mr. H. M. Carter, a Coventry rider of a Douglas, recently brought to our notice a neat wood holder for four Douglas valves—two inlets and two exhausts. The sketch is almost self-explanatory, but it may be well to point out that the valves are retained in place by a pin which passes through the valve

Wood holder for four valves.

cotter holes, the ring in the end of the pin being pressed over the stem foot of one valve which it is made to fit. The holder is one which motor cyclists who are handy with tools will probably desire to imitate.

### New Models.

1913 Precision engines will be on view at the Tollard Royal Hotel, Kingsway, from the 19th to the 23rd inst. Mr. F. E. Baker, the managing director of the firm, will be in attendance. Members of the trade are invited to present their trade cards.

### Speedometers.

We hear very good accounts of the Watford speedometer. Both the Norton Manufacturing Co. and Harry Martin and Co. have written the firm pointing out the remarkable steadiness of the indicating hand and the accuracy of the speedometer.

### Tyre Successes.

In the Sheffield and Hallamshire M.C. open hill-climb on Amber Hill, near Chesterfield, Dan Bradbury rode three different makes of machine all fitted with Clincher tyres, and obtained no fewer than three first prizes. Mr. Bradbury is the hon. sec. of the promoting club. The machines ridden were 2½ h.p. New Hudson, 500 c.c. Norton, and 560 c.c. Norton.

### Cyclecar Parts.

The New Merlin Cycle Co., Ltd., Gough Road, Birmingham, are now manufacturing component parts for cyclecars designed for 5-6 h.p., 7 h.p., and 8-9 h.p. V-type engines. These parts consist of flywheel and clutch, steering gear, differential back axle (chain drive), front axle, and channel steel chassis complete with semi-elliptical springs.

### Riding to the Butts.

The machine ridden by Arthur Fulton the King's prize winner at Bisley, is a Triumph. This speaks well for the vibrationless qualities of this make.

### The Guest Decompressor.

This device, which is made to screw into a valve cap, or, in case of sufficient room, between cylinder and tank, into the compression tap hole in the centre of cylinder, is made by the Guest Decompressor Co., 107, High Street, West Bromwich, and is extremely simple in action. It consists of a double-faced valve, which can be brought into operation by turning the knurled disc at the top. When the knurled disc is turned to the left the cam which is connected to it working against the body of the device raises the valve and prevents any gas escaping through the bottom face of the valve. To bring the decompressor into action the knurled disc is turned to the right, which leaves the valve free to act. At each compression stroke the top face of the valve is lifted from its seat and part of the charge leaks past so reducing the volume and likewise the compression. The decompressor is only intended to facilitate starting.

### Catalogues Received.

A well illustrated catalogue of the Williamson passenger motor cycles is to hand. These machines are made by the Williamson Motor Co., Cromwell Works, Earlsdon, Coventry, the engines and gear boxes being constructed by Douglas Bros., Bristol. The booklet illustrates the air and water-cooled machines, both of which are fitted with 8 h.p. twin Douglas engines of 964 c.c. The Williamson passenger motor cycles have been designed specially for sidecar work, and have chain transmission, 3in. tyres, and gear ratios of 4½ and 7 to 1. The petrol capacity is 1½ gallons, and oil half a gallon. We are informed that steady deliveries of these machines, both air and water-cooled, have been made for some weeks past.

### A Musical Horn.

The musical Testophone horn, which plays four notes in turn, the melodious sounds of which are often heard on motor cars, has now been made in a smaller size for motor cycle use. We illustrate the motor cycle pattern, which is sold in this country by Alfred Dunhill, Ltd., 359-361, Euston Road, N.W.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

## THE NEWEST DEVELOPMENTS

1912-13 Models in ladies' and Sidecar Machines of every best make can be seen in our Showrooms.

9, SHOE LANE, FLEET STREET, LONDON, E.C.

'Phone: 5777 Holborn. Wires: "Opifcer, London."

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, ad. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe and Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR BICYCLES FOR SALE.

## MOTOR BICYCLES FOR SALE.

£6/10.—Minerva, 2½ h.p., h.b.c., B. and B. carburettor, Palmer tyres, thorough order.—109, Clova Rd., Forest Gate. [3889]

WE Can Give Immediate Delivery from stock of the following new 1912 models; deferred payments arranged.

SINGER, 2½ h.p., 2-speed, control wire covers, £49/2/6; 3½ h.p., 3-speed, £58/15.

L.M.C., 3½ h.p., adjustable pulley, £48; 4 h.p., 2-speed gear, spring footboards, £65.

A.S.L., 3½ h.p. Precision engine, complete h.b.c.; £52/10.

HUMBER, 3½ h.p., Humber-Roc 2-speed gear, foot operated; £52/10.

SWIFT, 3½ h.p., free engine, var. gear, spring saddle pillar; £55/5.

MUNN and Underwood, motor cycle agents and repairers, Junction Garage, 165, Above Bar, Southampton. [X59]

1911 L.M.C., T.T. model, perfect condition; £29, or near offer for cash.—Tibbs, South Rd., Weybridge. [X107]

BRADBURY, 1912, June, free engine, run 200 miles, condition perfect; £45.—Putney Garage, Putney. [X8715]

1912 Phelon-Moore, practically brand new, ridden 700 miles; £52, no offers.—Matthews, pawnbroker, W. Croydon. [X162]

ZENITH, Rudge, and Douglas, all models, for immediate delivery; trade supplied.—Roy, 5, Heath St., Hampstead. [X890]

KERRY, 3½ h.p., low, powerful, just overhauled, new tyres, X'all forks; £10.—19, Woodville Rd., Golder's Green. [371]

KERRY-ABINGDON, 3½ h.p., 1910, standard, fine condition, accessories, and spares.—53, Park Rd., Wandsworth. [365]

8-10 h.p. J.A.P., B. and B., low, very fast, splendid order; £24, or offer.—Lancaster House, Richmond. [366]

5-6 h.p. 4-cyl. F.N., mag., good tyres, good order; £22, or offer.—Lancaster House, Richmond. [366]

3½ h.p. 1912 Ridges in stock, multi-speed gear, pedal starter, free engine, and multi plate clutch model; £60.

3½ h.p. Free Engine, multi plate clutch and pedal starter model; £55.

LARGE Stock of accessories kept; flying mascots 1/3 post paid.—The Surrey Motor Co., Eden St., Kingston-on-Thames. [375]

TRIUMPH, late 1911, nearly new condition, perfect running order; accept £36/10.—51, High St., Tunbridge Wells. [X951]

N.S.U., 3½ h.p., 1910, little used, Whittle, accessories, excellent condition; £23.—295, Garratt Lane, Earlsfield, S.W. [365]

RUDGE, 1912, free engine, only ridden 300 miles; cost £55 in June; 42 gns.—22, Hargrave Rd., Upper Holloway. [X5]

3½ h.p. Minerva, 1908, £15; 3½ h.p. Triumph, 1910, £22; both in excellent condition.—Clifford Cant, Braiswick, Colechester. [0140]

WANDSWORTH.—Great sacrifice, brand new R.N. 4 cyls. 10 months' guarantee; opportunity £45 secures.—Below.

WANDSWORTH.—Humber, 1909, 3½ h.p., m.o.v., mag., 2 speeds, Druids, handle starting; £28/10.—Below.

WANDSWORTH.—Roc, 1909, m.o.v., mag., 2 speeds, Druids, handle starting, perfect; £26.—Below.

WANDSWORTH.—Roc, m.o.v., mag., 2 speeds, handle starting, smart machine; sacrifice, £23/10.—Below.

WANDSWORTH.—N.S.U., 1909, 6-7 h.p. twin, mag., free engine, spring forks, runs fine; £18/10.—Below.

WANDSWORTH.—N.S.U., 3½ h.p., m.o.v., mag., new Whittle belt, all in nice order; £15/10.—Below.

WANDSWORTH.—Singer, 3½ h.p., mag., B.B., h.b.c., in new condition; great bargain, £14/10.—Below.

WANDSWORTH.—Indian, latest 1910 T.T., 5-6 h.p. twin, m.o.v., mag., fast, nice order; £28/10.—Below.

WANDSWORTH.—Enfield-Minerva, 3½ h.p., running; £5/15; ex-changes.—Wandsworth Motor Exchange, Ebner St., Wandsworth Station. [X227]

F.N. 2½ h.p. Lightweight, spring forks, mag., Palmer tyres, lamp, tools, complete; £15.—Peacock, 274, High Rd., Balham. [3663]

F.N., 2½ h.p., excellent order, new tyres, lamp, tools, complete; accept £12.—Peacock, 274, High Rd., Balham. [3664]

3½ h.p. Kerry, mag., var. h.b.c. carburettor, spring forks, Danlop belt, good condition; £15.—56, High St., Bexley, Kent. [3831]

T.T. Triumph, late 1911, perfect condition, trustworthier machine, new lamp, horn; £36.—35, Denman Rd., Peckham. [3807]

5 h.p. Roc-Peugeot, 1910, 2-speed, Bosch, Whittle F.R.S. lamp; £26, lowest.—Garaged, Meek's, 254, Acreway Rd., Highbury. [3840]

## MOTOR BICYCLES FOR SALE

1912 Bradbury, 3½ h.p., free engine, run 300 miles, excellent machine, not scratched, new end Jap £48.—Loke, Winchester. [X]

TRIUMPH, 1912, 3½ h.p., free engine model; immediate delivery; £55.—P. Spearman, Bridge Bishop's Stortford. [3]

NEW Hudson, 2½ h.p., 3 speeds, only ridden 200 miles; 40 gns.; ditto, 3½ h.p., quite new, 57 gns.—P. Spearman, Bridge St., Bishop's Stortford. [3]

CHATER-LEA-J.A.P., 4 h.p., 1910 (late), 1912 Palmer cords, Bosch (gear), lamp, horn, tools, offer.—240, Bow Rd., E. [3]

TRIUMPH, 1911, fitted with Mahon clutch, horn, lamp, and generator; £36, no offers.—Moss, 1, St. George's, Primrose Hill, N.W. [3]

1912 Rudge, just as new, Cowey, lamp, and lamp, £11/10, fitted with Palmer cord; offer.—Forest Drive W., Leytonstone. [3]

1912 Humber Lightweight, mag., lamp, spares, new; bargain, £25.—Fuller, 2, Rosemount, Finchley Rd., Hampstead. [3]

1911 Triumph, in excellent condition and on tyres unpunctured; £55, bargain.—Maths pawnbroker, W. Croydon. [X]

24 h.p. F.N., B. and B. h.b.c., tyres unpunctured, condition perfect everywhere; £9.—G.R., 10, Al St., Osney Rd., Old Kent Rd. [3]

DOUGLAS, 1911, splendid condition, accessories £27/10, or exchange 3½ h.p. machine—Pig-Tails Malbr. oks, E. Molesey, Surrey. [3]

MOTOSACOCHE, 1909, mag., accessories, excellent condition; any trial; £15.—N.C.T., Fench Southborough, Tunbridge Wells. [3]

3½ h.p. Triumph, free engine, excellent condition, £32, no offers; 3½ h.p. Humber, £25; 3½ h.p. Bradbury, £37/10.—Jeffery, High St., Guildford. [3]

3 h.p. N.S.U., m.o.v., low built, dry cell, 2 h.p. enamel and plating perfect, lamp, horn, and tools; any trial.—106, Church St., Chelsea. [3]

CHATER-LEA, new, No. 7, 6 h.p. J.A.P. engine, ready for delivery.—To be seen at showrooms, Cars, London Agency, 53, Goldhawk Rd., W. [3]

F.N., 2½ h.p., 2-speed, shaft drive, good as new, on little machine, Jones speedometer, all tools, spares; £27.—151, Beulah Hill, Upper Norwood. [3]

2 h.p. Vaf, Amac carburettor, trembler coil, horn, and boards, good condition; £6, or nearest offer.—181, Mayall Rd., Brixton. [3]

1911 Triumph, perfect condition, tyres and belt with spares and tools complete; £35, or near offer.—10, Norfolk Rd., Dorking. [3]

HUMBER, 1911, 3½ h.p., 2-speed, and sidecar, 1 foot, spares and accessories; £40, or offer.—Parish, Primrose Hill, Chelmsford. [X]

3½ h.p. Rex, Bosch, B. and B., lamp complete, etc., splendid condition; sacrifice at £18/10.—Falter, 102, Hangerston Rd., N.E. [3]

4½ h.p. Twin Minerva, very low, everything lat £22, powerful, grand condition; £15/10, or exchange.—137, Rye St., Bishop Stortford. [3]

DOUGLAS, 2-speed, clutch, new May; cost, £22, extras, £27/10; perfect, done 600 miles; offer 2, River View Gardens, Barnes, S.W. [3]

3½ h.p. N.S.U., 2-speed, and free, mag., lin. Whit B. and B. h.b.c., in good order; £17/10.—F. Wood, Gloucester Rd., Walthamstow. [3]

1912 Bradbury, free engine, and sidecar, had a little use, all as new; best offer over £25 secures.—189, Church Rd., Willesden. [X]

5-6 h.p. Twin, X'all spring forks and saddle, Hutchsons heavy tyres, excellent condition; £15, or exchange.—12, Loughborough Rd., Brixton. [3]

MOTOSACOCHE, 2½ h.p., 1912, almost new, ridden few miles; cost £40, sell £30; no offers.—W.G. 627, Barking Rd., Plaistow, London, E. [X]

3 h.p. Quadrant, B.B. carburettor, Clincher and front, new Dunlop back, engine perfect; £12, no offers.—14, Oakland Rd., Dovercourt. [3]

MINERVA, 1½ h.p., in grand running order, 2 h.p. Palmer, new accumulator, etc.; £6; would 15 miles.—44, Union Grove, Clapham. [3]

PEUGEOT 6 h.p. twin, 1911 Bosch, free engine, spring forks, Chater frame, low and fast, perfect condition.—69, Greenside Rd., Croydon. [3]

HUMBER, 1912, new July 1st, 2-speed, free engine only ridden 400 miles; cost £52/10, equal to £46.—Humber, 11, The Leas, Folkestone. [3]

MOTOSACOCHE, 1910, 2 h.p., mag., 2 h.p. head light, footrests, Druids, guaranteed; £12, lowest.—67, West Side, Clapham Common. [X]

DOUGLAS, 1909, 2½ h.p., new covers, just been overhauled, guaranteed good condition throughout price £22.—Rose, Motor Works, Uxbridge. [X]

5-6 h.p. Chater-Sarola Twin, new 26x2½ Continental B. and B., and Whittle, dry battery ignition; £14.—14, Cavendish Gardens, Clapham, S.W. [3]

3 h.p. Humber, free engine, low position, h.b.c., battery in good running order, will pull side seen any time; £5.—Rosemount, Stanley Rd., S.W. ford, N.E. [3]

### Lessons of the Six Days' Trials.

**L**AST week's thousand miles trials of the Auto Cycle Union proved to be the biggest and best organised event in the motor cycle world. The large districts covered and the reliability demonstrated in all weathers should do much to help forward the motor cycle movement. We referred last week to the special points and departures in design of the competing machines, for it is usual for manufacturers to put their models of the ensuing year through the August reliability test. Dealing now with the lessons to be learned from the results of the trials, we gather from observations made whilst riding with the competitors that, in such counties as Somerset and Devon, a change-speed gear is an indispensable attainment, but that any sort of gear will not do. By this we mean that a gear giving only a small reduction on the low speed is little better than a single gear. Many competitors who have marks recorded against them for failures on hills did not lose them owing to lack of engine power, but simply owing to being unable to use it through the medium of a low gear ratio. It is, of course, generally agreed that three speeds are better than two, and as a further proof of this contention we may cite an instructive experience on the first day. A strong easterly wind was blowing in the teeth of the riders while crossing Dartmoor. The two-speeders were noticed with their backs down doing their utmost to keep on top gear. The three-speeders, on the other hand, dropped to their middle ratio and got along comfortably. But against some of the three-speeders it may be said that the lowest ratio is not low enough to ensure an ascent of Porlock under conditions such as obtain on a wet day. In

other words, the low is not an "emergency" gear as it should be.

In praise of the two-speeders it can truly be said that several successful examples more than held their own with the three-speeders. They could climb 90% of hills on top, and had recourse to the low gear for emergencies only. The variable pulley gears suffered by reason of the fact that their lowest gears were too high for precipitous hills. We pointed out last week the general improvement in protecting the belt and other vital parts of the machine; and our remarks are amply confirmed by the results, for only a single case of failure on hills due to belt slip came under our notice, and the weather was unusually bad. Belts, too, have been improved, several competitors actually never had occasion to touch them from start to finish. It should, however, be stated that chain-driven machines scored decisively, as an examination of the results will show. Altogether the trial was a huge success, but a suggestion we should like to make for next year is to award a prize for personal appearance. Some of the competitors were a disgrace to the pastime. Some carried tubes wrapped round their necks, belts around their waists, and oil tins secured by string. Such methods offend rather than attract new converts. It has been argued that the result of a strenuous trial embracing such a number of freak hills and on which there were so many failures may have a tendency to deter intending purchasers, but it must be remembered that these events are held to improve the all-round efficiency and reliability of machines, and that to settle the awards there must be an elimination. Many of the machines which failed on abnormal hills would suit more level districts.

### THE INCOMPLETE FOURTH STROKE.

The appended diagrammatic sketch serves to explain the ideas of an eighteen year old correspondent on the subject of cylinder scavenging. It will be seen that a separate piston is placed in the head and operated by cam gear through an overhead rocker. (In the specification a forked rocker, operating two plungers on the piston, is mentioned,

Diagrammatic sketch of auxiliary piston.

but for simplification only one is shown in the sketch.) At the end of the exhaust stroke, the auxiliary piston would be forced down and thus expel the last remnant of exhaust gases. The idea is quite ingenious, but is, unfortunately, not new, and the experiments that have been made in this direction have mostly failed on account of the force required to start the auxiliary piston from rest.

### A LUBRICATOR AND FILTER.

Several novel fittings to a motor cycle were recently brought to our notice by Mr. J. Bates, of West Hampstead, London. Made according to his own idea, they are fitted to a 1910 clutch model Triumph, and, we are told, act very satisfactorily.

Fig. 1. An automatic lubricator.

The first, an automatic lubricator, is shown in fig. 1. To prevent oil being blown back on to the sides of the glass bowl by the pressure from the crank case, as is the case with most drip feed lubricators, a cylindrical brass box A has been interposed between the inlet to the crank case and the glass bowl, on to the sides of which the oil is flung. In the hollow portion B a jet is placed to further minimise the tendency for oil to be forced back into the upper portion of the lubricator.

The method of working is as follows: At the bottom end of the hand-operated pump is a two-way tap, so that the oil may be pumped into the crank case direct

Fig. 2. A carburettor air filter.

or into the lubricator. Before starting on a ride a quantity of oil is pumped up into the glass bowl C through the pipe D; thence it is sucked to the crank case by way of the box A and lower tube E.

Fitted to the same machine is a Binks two-jet carburettor, to the air inlet of which is fitted a novel air filter. An old carbide tin forms the framework. In this six or eight slots have been cut, and the end has been removed, all the openings being then covered with fine wire gauze. The whole is clamped on to the end of the trumpet-shaped adapter by means of a spring, as shown in fig. 2. Round the top of the float chamber, as will be seen, Mr. Bates has fitted a guard of flat brass to prevent the rider's trousers catching the lid of the float chamber and pulling it off.

### A LONG CONTINENTAL RIDE.

A French motor cyclist, named Lucien Psalty (whose photograph is reproduced on this page), residing in London, sends us particulars of a 3,000 miles Continental ride accomplished in twelve days. Starting from London recently, he went

Lucien Psalty and his 3 1/2 h.p. Triumph, on which he recently accomplished 3,000 miles in twelve days.

by road to Newhaven, crossed to Dieppe, and thence by road to Paris, Bar-le-Duc, and Nancy to Strasbourg, thence to Belfort, and through Doubs, after climbing the Ballon d'Alsace, on to Neuchâtel (Switzerland), and back into France to Pontalier. Again crossing the frontier into Switzerland he visited Lausanne and Geneva, returning to Lyons by Bellegarde and Culoz. After Lyons the route was Valence, Montelimar, Avignon, Marseilles. Nîmes, Salon, through the provinces of Aveyron, Lot et Garonne, and Gironde. Thence to Nantes, Rennes, Mont St. Michel, Caen, Rouen, Paris, and back to London via Dieppe and Newhaven. He rode a Triumph motor bicycle. His international travelling pass, No. 1992, issued by the A.A., shows the Customs date stamps at various towns on the route.

### HAMILTON BIFUEL CARBURETTER.

This carburettor consists of two separate fuel nozzles A and B mounted side by side within a small choke tube C leading into the mixing chamber of the carburettor. Each fuel nozzle is in communication with a separate float chamber of the usual construction, one being fed with paraffin and the other with petrol. Mounted upon the central choke tube, and arranged to operate as a dashpot or damping device, is an air valve, held in its normal or shut position by a suitably proportioned spring or by a dead weight. This air valve is in the form of a circular disc, and is arranged to open by movement upwards against the action of the spring. The air valve E carries a bridge piece in which are adjustably mounted two tapering needles, which coincide with and slide within the orifices in the top of the fuel nozzles, thus forming variable fuel valves. The walls of the cylinder D are so shaped and proportioned that for any position of the air valve the ratio of openings presented respectively by the air valve and the combined fuel valves remains constant.

The Hamilton Bifuel carburettor, designed to consume petrol and paraffin, which are mixed at the jet in the desired proportion.

In the first place, the respective areas of the two fuel nozzles are so proportioned as to give the required percentages of petrol and paraffin required in the mixture. Suitable needle valves are then fitted to the bridge on the air valve. With the main air valve in its normal or shut position, the needle controlling the paraffin orifice is screwed down until in this position the paraffin is entirely shut off, whilst the needle controlling the petrol orifice is adjusted until just enough petrol is allowed to pass to carburet the small amount of air passing through the central bypass or choke tube. We have thus what is virtually a very small petrol carburettor sufficient to feed the engine running slowly on nearly closed throttle with no load, and also sufficient to start up with from cold, but directly the throttle is open the air valves opening automatically, bring into simultaneous operation both the petrol and paraffin orifices, and the engine continues to use the mixed fuel in the proportions as decided by the respective areas of opening of the two nozzles.

It has been found in practice that it is possible to run the Bi-fuel carburettor economically with 60% of petrol and 40% of paraffin without any further heating than that provided by the usual hot air intake pipe F.

## A STREAMLINE CONVERTED TRICAR.

**W**E have received some interesting photographs of a conversion by Mr. H. G. Featherby, an engineer of Bishop's Stortford, who writes as follows:

"I am sending you herewith some photographs of a tricar which may perhaps be of interest to some of your readers. I use the machine constantly as a business runabout, and in designing the present body I have kept to streamline form as far as conditions

Torpedo bodied tricar constructed and used by Mr. Featherby.

permit. The external fittings are as few as possible, and the wind resistance practically nil; in fact, just as good time can be made against a gale as with it.

"The underbody, which is of sheet iron, is continuous with the shell, and the clean run from end to end thus obtained renders the machine almost dustless. The shell is built of 3-ply wood,  $\frac{1}{4}$  in. thick, on a light bent wood frame. Bucket seats are slung from the coamings round the hatchways, and all the controls and attachments are inside.

"The engine is a twin Fafnir, 80 mm. bore, water-cooled, the radiators being arranged in two sets, in close fitting boxes, each side of the body. Large scoops catch and convey cold air to the boxes, and this finds its exit either through the louvred plates to the outside, or through controllable openings into the body for warming purposes in cold weather. The small louvred plates fore and aft are for body ventilation.

"The height of the glass screen can be regulated by sliding it in its frame. The lamps are electric, which permits them

being fitted in neat sockets. The top of the lamp sockets forms a step for access to the passenger seat. The tail lamp is inside the body altogether, the rays being projected down the fin-shaped box, the sides of which are cut to form the registration number. A white diaphragm down the middle of the box renders the sign quite readable by daylight, as may be seen by the photograph, and when illuminated at night it is very much clearer than the usual painted plate with outside lamp.

"The tanks are slung to the underside of the deck between the hatchways, the fillers being brought up through. The engine is fitted with a Polyrhoe carburettor and a Mea magneto, and the transmission is by chain through a 3 speed and reverse gearbox.

"When the machine came into my possession it had come off decidedly second best in an argument with a farm cart.

"If any of your readers possess a heavy tricar of this now almost obsolete type, I can recommend a conversion somewhat on these lines. It makes a most comfortable and handy runabout which handles much more like a four-wheeled car than a three-wheeler. There is an almost entire absence of the roll which is so pronounced on most tricars. There is plenty of leg room and ample space for adjustments."

This conversion is made more than usually interesting from the fact that the makers of the Raleighette the Raleigh Cycle Co., Ltd., Nottingham, are no longer makers of motor cycles. It is a thousand pities that this firm relinquished this branch of their business, as the Raleighette was one of the best tricars that was ever turned out.

End view of body fitted to an old Raleighette.

J. P. Haswell (3½ h.p. Triumph sidcar) leaving Taunton in the A.C.U. Six Days' Trials.

### The Warwickshire Battalion of Motor Cyclists.

SOME few months ago I was able to tell my readers that a cyclist battalion was to be formed in Warwickshire, and some two months later this statement was officially confirmed. That energetic officer, Colonel Ludlow, is to be honorary colonel, and we now have it on his authority that the new regiment is to consist entirely of motor cyclists. I am under the impression that Colonel Ludlow's hopes have outstripped the facts, and that the Director of Military Training and Organisation has not yet definitely considered the proposition of forming this battalion entirely of motor cyclists. Moreover, I am very doubtful whether, when he does come to a decision, it will be entirely on the lines foreshadowed by Colonel Ludlow.

### The Arming of Motor Cyclists.

The idea is that there will be some three motor cycles, and that every private will have a pillion seat fitted on the back carrier on which a second man can ride as passenger. The officers and N.C.O.'s will presumably not carry passengers. If any organisation on these lines is finally adopted, then one cannot too strongly urge that the passenger should be armed with a "Rexer" automatic rifle. This gun is capable of firing about 220 rounds a minute, and can be fitted with stays to act as a support, for, weighing just over 20 lbs., it is too heavy for a man to hold without some form of support. Experiments in foreign armies have taught that the ideal arrangement is to tell off two men for each "Rexer." One carries it and fires it, the other carries the ammunition and observes the fire; and in the case of this motor cyclist battalion the passenger would be the man with the gun, since the man who steered would make very poor shooting after holding the handle-bars for a few miles, especially on slippery or badly-made roads.

### Captain de Putron's Scheme.

This idea of using motor cyclists in conjunction with automatic rifles is not new; it was formulated a couple of years ago by Captain de Putron, one of the staff instructors at the School of Musketry, Hythe. In his monograph on the subject, which is now reposing in a pigeon-hole at the War Office, he suggested that these motor cyclists should be raised in companies of forty men, each company being attached on mobilisation to a cyclist battalion guarding the coast. He argued, and very soundly, that this would place in the hands of the officer commanding an extremely mobile unit with immense fire power which he could throw at any threatened point in a very short space of time. These men would keep the enemy busy whilst the cyclist battalion was concentrating and proceeding to oppose the landing. Covered by the battalion, the motor cyclist company would then be able to disengage itself and replenish ammunition supplies

### Pillion Seats.

At that time motor cycles were neither so powerful nor so reliable as they now are, and he overlooked the possibility of carrying men on the carrier. I would now suggest that motor cycle drivers should be armed with automatic pistols for their own defence; in an emergency they would then, to a small extent, be able to provide a covering fire for their Rexer comrades when the time came for these to extricate themselves from the fray. The principal drawback to the pillion idea is that if anything goes wrong with the bicycle it throws two men out of the fighting instead of one. That was one reason why the tandem bicycle was a failure from the military point of view.

### The Sordid Question.

Of course the question of expense is one that will weigh heavily with the authorities in giving their sanction to the raising of a motor cyclist battalion. At present the allowance to cover wear and tear, petrol, and insurance is 6s. 6d. a day, and it is now being altered to 8s. Three hundred times eight shillings for a fifteen days' camp adds up to quite a biggish sum, and each passenger machine will probably want a larger allowance than even eight shillings. There is, however, a way out of this. There would be no military value in taking the battalion out fifteen days running on a motor cycle joy ride. For the purposes of training it would be quite sufficient to motor down to camp and back again with, say, two days during the training when the motors would be required to go any distance at all. Therefore an allowance of £2 per machine for annual training would be about the correct amount, and this would total up to just about the same sum now allowed to a cyclist battalion of 525 men for hire of their cycles.

### Army Manœuvres.

All motor cyclists who wish to attend the Army manœuvres have still three days in which to join the Legion of Cyclists and to send in their applications. The cycle allowance will be on the 8s. scale, and those men not attached to a unit for messing and sleeping will draw another 8s. a day to defray living expenses.

The full period of manœuvres will be from September 8th to 20th, both days inclusive, but those unable to come for the whole period should state exactly what days they can come for; they will stand a good chance of being able to come out, but of course men applying for the full period will get the preference.

Applicants should write direct to the Hon. Sec., The Legion of Cyclists, 128, Jermyn Street, and enclose 1s. for postage and telegrams, etc., and 1s. 4d. for the Legion badge.

The list of applicants will be made up definitely on August 25th.

# Occasional Comments by "Ixion"

## Useless Straps.

It is astonishing that so many firms supply various cases designed for attachment to motor cycles either by leather straps or by ordinary bolts and nuts. I have warned the trade until I am tired that only one attachment is any use so far as my experience goes, namely, a clip composed of a flat steel plate, a bent steel plate, two D nuts, and two bolts. Please print the "D nuts" in heavy type, Mr. Compositor, for they are the heart and soul of the device. This attachment cannot break or shake loose, and in this respect it is unique in my experience.

## Some Transmission Notes.

I see Mr. T. F. Maw prefers the complete chain drive to that hybrid pattern which employs a belt as its primary unit. Each to his whim. The curious obsession which attacks most chain-drive enthusiasts is their stubbornness in ignoring the fact that British riders have always cast a heavy majority verdict in favour of the belt; and that consequently theory is a matter of small moment. Personally I am again experimenting with chain drive for next year. I make it a rule to buy at least one chain-driven machine every other year, but my last two experiences were unhappy. I selected machines of leading makes in both instances. On the first occasion my machine was technically disfigured by the fact that two of its chains shared a common adjustment. I will not say—at this lapse of time—that I had to adjust my transmission oftener than is the rule with the belt, but I will say that the adjustments were much dirtier, and occupied more time, and that even then my chains were never all three in perfect adjustment.

## Experiences with Chain-driven Machines.

On the second occasion I had a two-chain machine, and I adjusted its transmission eight times in the first month, after which I had to purchase new draw-bolts, as the threads were stripped, and the flimsy nuts badly burred. I then sold the machine for reasons unconnected with its transmission. In spite of these somewhat depressing experiences with the drive which a minority of the riding public are always applauding, I show my fairmindedness by ordering a chain-driver for next year. This machine again is disfigured by a grave technical flaw in its transmission design, but its public performances, and the praises showered on it by many riders, lead me to hope that this defect is less serious on the road than it is on paper. I am afraid I am an incorrigible, prenatal belt enthusiast, Mr. Maw; but if I enjoy a season of entire freedom from transmission troubles with my 1912 chain-driver, I hope I shall be frank enough to say so. The arguments in Mr. Maw's letter will only bear one interpretation, and that will not be agreeable to him. If that item of chain drive which the general public are clamouring for is the weakest item, obviously the public are being compelled against their will to resort to a length of chain for belt reasons, and are not at

all spontaneously fascinated with chain drive in itself. The facts are perfectly simple. A majority of motor cyclists clung to the direct belt drive as long as possible; but the vagaries of indiarubber belts with big engines in wet weather competitions, and the failure of direct belt drive on small-engined small-pulleyed lightweights, made some modification inevitable.

## The Two Alternatives.

There were two alternatives—to scrap belts altogether, and adopt a complete chain drive; or to relieve the belt of its one and only weakness. The latter escape seems the more popular. In answer to another letter, I still claim the credit of popularising the combined drive for Douglas Bros. Others undoubtedly utilised it before the Bristol firm, but their machines have made its merits public property. If it were not for the counter-shaft gear box, it is quite possible that a shielded belt would have been the more popular solution; for with a very little ingenuity in the way of weatherguarding, the belt would have solved all problems on a single-gear 3½ h.p., whatever might have been needed on the small pulleyed lightweights. But the growing popularity of the counter-shaft gear box indicates a chain as the primary item; and the referendum verdict of twelve years indicates a belt as the secondary item. Of course, it may all be mere prejudice, and the chain may ultimately oust the belt. But I think it is sound judgment, founded on the simplicity of belt adjustments, the stupidity of the average amateur, who cannot trust himself to attend to chains, and the cleanliness of a (rubber) belt as opposed to the grease which haunts a well lubricated and well-used chain.

A.C.U. SIX DAYS' TRIALS.  
F. H. Thornton (5 h.p. Swan). This was one of the best mudguarded machines in the trials.

## QUESTIONS & REPLIES

SRJ

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Legal—Driving to the Common Danger.

**?** I am under the impression that a motorist must have been seen riding to the common danger by a member of the police force before a conviction can be obtained. Is this so? I am sure an answer in *The Motor Cycle* would be of great interest, as many fellow motor cyclists are of my opinion, rightly or wrongly.—R.A.L.P.

Our legal adviser writes as follows: "In reply to the letter from 'R.A.L.P.,' there is no provision under the Motor Car Act that the evidence of a member of the police force is necessary before anyone is convicted of dangerous driving. In fact one witness would be sufficient whether such witness was a police constable or not. Of course, to obtain a conviction for exceeding the speed limit two witnesses are necessary if the speed given is a matter of opinion only, but a single witness is sufficient if the speed is not given as a matter of opinion, but as a matter of fact ascertained by measurement of distance and time."

### Driving Licences.

**?** Being a regular reader of your excellent journal, I should be glad if you could favour me with some information on the following question. I have a driving licence taken out from the L.C.C. on March 19th, 1912, which is made out to me at my address in London. I now find that for business purposes I shall have to live in Cheltenham. Will the L.C.C. endorse it with the new address, or must I take out a fresh licence (and pay 5s.) from the Gloucestershire County Council?—C.F.K.

There is no need for the L.C.C., or any other authority, to endorse your driving licence with the new address, but when you take out the fresh licence in March, 1913, you will have to apply to the nearest police offices to your residence, when a fresh licence will be issued with your new address. In the case of the registration, it would be necessary for you to inform the County or Borough Council with whom your machine is registered of your change of address and send them the registration form for alteration. There is no fee for amending the particulars on the registration form. The authorities are compelled to make this alteration and provide you with a copy of the details

### Magneto Timing.

**?** My machine had a fall when I was mounting, but engine went on running for a minute or so, then stopped, the driving chain coming off. I failed to get it to work again; firing in the exhaust pipe. I took the engine down and found two piston rings broken. (1.) Do you think that was the cause of firing in exhaust? (2.) The timing I found incorrect, the spark occurring when piston was just down. I have timed it when piston is in, on downward stroke. Am I right? (3.) The spark occurs on alternate stroke. Is that as it should be?—O.M.

(1.) No firing in the silencer would be caused by an explosion being missed in the cylinder and fired by the next hot gas which entered the silencer. (2.) The driving chain you refer to as coming off is, we presume, the chain which drives the magneto, as you found engine timed incorrectly. The engine would not run at all timed as you mention. To time magneto you should retard lever to full extent, place piston on dead centre of compression and firing strokes, when contact points should be just about to separate. The spark occurs in a four-cycle engine once every other revolution of the flywheel.

### Hounslow to Newark.

**?** Would you kindly inform me the best route from Hounslow to Newark (Notts.)? I want to make as fast a journey as possible, and should be glad if you would give me (1) route avoiding London, (2) through London.—S.L.S.

Your best route would be as follows: Hounslow, past Heston-Hounslow Station, Heston, Norwood Green, straight across the main road to Greenford, where turn left and then right through Greenford Green and Harrow-on-the-Hill. At the bottom of the hill turn right. Through Pipers Green, on to the main Edgware Road; turn down this, and take the turning to the left past Hendon Station, which brings you on to the main Great North Road. Follow this through Barnet, Hatfield, Welwyn, Stevenage, Baldock, Biggleswade, Buckden, Eaton Socon, Stamford to Newark. Through London, follow the main Bath Road right through Hammersmith Broadway, then go down Holland Road, up Notting Hill, turn into Oxford and Cambridge Terrace, and straight on till you come to Lisson Grove; this brings you close to the G.C. station. Go straight into Grove End Road, bear right by a fountain and then left, which will bring you into Finchley Road, where you enter the Great North Road.

A.C.U. Six Days' Trials. The G.W.K. cyclecar on the weighbridge at Taunton. J. T. Wood, the driver, is the central figure of the three just behind the machine.

## Jockey Pulley.

**?** In your "Hints and Tips" I observe the author advises the use of a jockey pulley as a preventive for belt slip. The roads in St. Anstell during wet weather get in a vile condition owing to the china clay traffic, and the belt slipping problem is an important one, especially upon hills. In wet weather I use a  $\frac{5}{16}$  in. Watawata upon my Douglas. Having about  $\frac{7}{16}$  in. to spare I am wondering: (1.) Whether a jockey pulley would be suitable? (2.) Where could such pulley be obtained, and what size pulley? (3.) Which do you consider the most suitable place to fit upon a Douglas "E" model.—J.S.

Why not have the firm's own two-speed gear and countershaft drive fitted? This would be better than a jockey pulley. If you have made up your mind to try a jockey pulley you would probably have to have it made locally. We know of no one marketing such a device to suit any machine. In the case of a Watawata you would have to use a specially made jockey pulley with a groove in the centre to take the heads of the rivets of the large washers, otherwise no doubt noise would be caused. We think the best place to fit it would be on a bracket fastened to the seat tube like the Moto-acche, and it ought to be controllable by means of a Bowden wire or lever so that it could be tightened and slackened according to circumstances.

## Petrol Consumption.

**?** I have recently purchased a  $\frac{3}{4}$  h.p. New Hudson. During my first fortnight I did 540 miles on good roads (about 300 solo and 240 with sidecar and passenger). During this time I used nearly nine gallons of petrol, giving me an average of about 64 m.p.g. Ought I not to do more than this? I have a B. and B. carburetter. I don't know the size of the jet, but it is a large one, and has been on all the time, even when I was riding solo. You must take into consideration the fact that I live in London, and at the beginning of every ride I have a few miles of traffic to get through, which entails constant use of the low gear (10 to 1). Should I try a smaller jet, or would that give me too little reserve power for hill-climbing when using the sidecar with a passenger.—J.P.C.

We do not consider sixty-four miles to the gallon very excessive with a three-speed machine and sidecar. Probably with very careful driving you could improve on it, as it is certainly possible to do more, but if you alter the size of the jet you may reduce the power of the machine on hills, necessitating the use of the low gear for many hills which you now climb on either the top or middle speed. We should advise you to keep ignition advanced as far as possible consistent with the speed, and drive with the throttle lever as far closed as possible, using the free engine clutch to descend all long hills. Of course, you drive with the air lever open as far as possible consistent with obtaining a good mixture. These are the essential points in connection with economy of petrol. The normal jet should be No. 32.

## New Piston Rings.

**?** I have a  $\frac{3}{4}$  h.p. machine, and recently fitted new piston rings. I have also ground in both valves. Compression is not so good now as when I first fitted rings, after only 200 miles. When I had fitted them I was surprised to find compression was perfect, but now it is only really good when the engine is warm. (1.) Do you think the cylinder requires reboring? I do not see why it should, or why was compression so good when I first fitted rings and before they had run at all? (2.) Ought not this to do more on the flat than 35-40? Can you suggest anything to give more speed? I have been altering the carburetter, and have now, I think, got it at its best. My gear is  $4\frac{1}{2}$  to 1. (3.) Why does my engine overheat? It is very hot after a fifty-mile run. I run with spark advanced nearly full and as much air as possible, getting about 95 m.p.g.—W.B.

(1.) Probably either new cylinder or piston is required. You may have been deceived when fitting new piston rings. These would be tight, and what you thought was good compression may have been partly due to tightness of the piston rings. (2.) You do not say the date the machine was built. If it is an old pattern it probably wants new cylinder and piston before it will exceed 35 to 40 m.p.h. and climb hills well. (3.) We cannot tell you why the engine overheats. It may be due to a number of causes. We presume it is quite clean on piston and combustion head; that is to say, it has recently had carbon deposit scraped off. Consumption seems to be about right. Do you think the engine gets hotter than other motor cycle engines after a fifty miles run? You must bear in mind that they all get fairly hot

## READER'S REPLY.

I have noticed in "Questions and Replies" a query by "H.R.H." concerning sudden loss of power on hills. I have experienced exactly the same symptoms with my motor cycle and sidecar. I happened to change my plug (originally a Bosch) and met trouble. I use Price's lubricant, and have always found it satisfactory. The engine, though apparently seizing up, ran quite free when pedalled on the stand, and ran quite well after half a minute's rest. I diagnosed the trouble to be due to the new plug having long electrodes, which, evidently, became red-hot and set up slow combustion of the fresh charge on the compression stroke. I put in the original plug and ran over the course where I previously experienced trouble—result no loss of power nor overheating. I had previously lubricated well, and on this test I drove hard and kept the oil consumption down. I trust my experience will be of some use to "H.R.H."—G. W. TRENDALL.

## EXPERIENCES WANTED.

"A.C." (Birmingham.)—5-6 h.p. A.J.S. and 5-6 h.p. Blumfield, both with sidecar.

"R.C.G." (Bridlington.)— $\frac{3}{4}$  and 6 h.p. Zenith Graduas with and without sidecars.

"C.F." (Doncaster.)—(1) Bowden two-speed and (2) Haden three-speed on  $\frac{3}{4}$  h.p. 1912 Triumph.

If "J.C." (Sandiacre), "Knarf" (no address given), "H.W.S." (Bacton-on-Sea), "R.R.T." (Aldershot), and "A.E.B." (Eastbourne), will comply with our rules and send stamped addressed envelopes, their queries will be answered.

## BARRED!

An incident of the English-Dutch Trial; unloading F. W. Barnes's Zenith-Gradua sidecar at the Hook of Holland. The photograph is reminiscent of the barred cage on the Zenith Co.'s stand at the last Olympia show.

## SIX DAYS RELIABILITY TRIALS

*Taunton as a Centre*

THE 1,000 Miles Trial of 1912 will be remembered for long to come. The severity of the Devonshire hills, for years avoided by the average tourist, account for a big proportion retiring from the contest, and the survivors losing marks, but, on the other hand, last

L. Cass (3½ h.p. Quadrant), turning the corner at Two Bridges.

week's trial proved conclusively that 50% of present-day motor cycles stop at nothing. Hills with the steepest gradients do not worry the riders, and as for reliability, they can reel off mile after mile, day after day, with clock-like regularity.

### Second Day, Tuesday (continued).

Taunton, Bampton, Barnstaple, Ilfracombe, Lynmouth (slow hill-climb), Countisbury, Porlock, Bridgwater, Somerton, Langport, Taunton Distance, 160½ miles.

Our last week's report of the first two days' runs left off after the ascent of the tit-bit of the trial—Beggars' Roost, or Barbrook Mill Hill. From the list of successes it would be seen that quite half found the gradient of 1 in 3½—the steepest gradient in Great Britain—too much for their machines. All credit to those who were successful. Long before the tail end of the string had reached Barbrook, the vanguard had commenced the slow climb up Countisbury, after lunching at Lynmouth. Consequently *The Motor Cycle*, with its two representatives mounted on motor cycles—a B.S.A. and P. and M.—is in the happy position of being able to record from personal observation the performances on these two hills.

A clean ascent of Beggars' Roost meant a bonus of 25 marks to the successful riders, but failure did not involve loss of marks. Complete teams which easily accounted for the climb includes the James, Scott, and P. and M.—singularly enough, all chain-driven machines. Lister Cooper on the single-gear Triumph was anxiously awaited by the crowd assembled on the hill, and there was general regret on learning of his retirement owing to an engine seizure. The trouble is unaccountable, and it is worthy of note that this is the first time for years of Six Days' Trials that a trade Triumph has been withdrawn. F. G. Edmond (3½ h.p. Humber) was another who did not reach the hill, it was

subsequently learned owing to his rear tyre continually coming off the rim. C. P. Finn (Enfield sidecar) was also an absentee, and news came through that he had retired. One of the judges, Rev. E. P. Greenhill, riding a Douglas, had a valve rocker break. He was towed some miles by a sporting farmer, who left his hay and got out his motor cycle. Then Major Nicholl towed him to Lynmouth, where Fletcher supplied a replacement.

### The Slow Test on Countisbury.

Returning to our observations on Countisbury, it will be remembered that this long gradual ascent, which is preceded by a quarter-mile of 1 in 6, had to be climbed at a speed not exceeding 12 m.p.h. Excess of this speed involved loss of marks. It was not expected that there would be failures, but nevertheless several came to a standstill, most probably due to attempting the steepest section at too slow a speed. There was no rain at Lynmouth on Monday, so the surface was quite dry. J. F. Sirett (7 h.p. Indian), one of the first arrivals, impressed everyone by the silence and smoothness of running of his engine. S. C. Hubbard (Bradbury) and A. H. Alexander (3½ h.p. Indian) assisted with their feet, whilst W. Creyton (Humber) stopped, as also did L. Cass (Quadrant), R. E. Guest (Matchless sidecar), and J. Munday (A.C.). Of the others, again the whole team of P. and M.'s, Scotts, and Jameses crawled up on their low gears, evidently in an attempt to win the special prize for the slowest ascent. Other machines which toyed with the gradient were Crawley's and Newsome's Triumphs, Alan Hill's Indian, the Douglasses, New Hudsons, Motosacoche, L.M.C.'s, Enfield, and the three Rovers. Wasley did well, especially as he had taken the timing gear out and replaced it at the hill foot. Mrs. Hardee (P. and M.) and Miss Hammett (Douglas) sailed up comfortably, attempting nothing sensational, at a slow speed. The Zenith and Ariel

Marking off the starters' numbers in the Drill Hall Yard, Taunton.

J. T. Wood (G.W.K.) on Beggar's Roost. Not long ago this hill was considered almost unclimbable.

riders also appeared to be travelling at a good 12 m.p.h. W. E. Cook's N.S.U.-geared A.S.L.-Precision made a sure climb. Singularly enough, practically none of the passenger machine drivers attempted slow ascents, though they could surely have scored over the bicycles on account of their stability.

#### The Hero of Beggar's Roost.

J. R. Haswell, however, the hero of Beggar's Roost, on his three-speed Triumph sidecar, simply crawled from bottom to top. His slow ascent was as monotonous to himself as the spectators, for it appeared he would never get out of sight. How his engine is able to plug away uphill for over a mile on a 16 to 1 gear without knocking itself to a standstill is a mystery. About a quarter of an hour is Haswell's time. There was much delay in the concluding stages of the slow climb owing to coaches and cars blocking the narrow road.

We were now in the tail of the procession, and hurrying along over Exmoor by the coast road to Porlock without time to enjoy to the full the magnificent land and seascapes. We were astonished to meet competitors riding in the opposite direction. They were, however, the early birds trying Porlock, Saturday's test hill. The surface was good, so most succeeded. L. Cass (Quadrant) had a badly-burst tyre, and twice stopped to effect repairs. We also passed Collier (Matchless) with belt trouble. There is a hairpin bend on a hill out of Porlock; competitors

came upon it unawares, and several failed miserably. Near Minehead we overtook Gray (Rudge multi) with his gear in pieces by the roadside. It had run hot, and gave a free engine in all positions. Having wasted over two hours endeavouring to put matters to rights, he retired, and was towed to Minehead Station by the Kempshall tyre car. Further on Creyton (Humber) was again in trouble, his timing having shifted. He, too, lost the limit of time, so gave up. Near Williton we noticed the Duo by the roadside, and, stopping to enquire, found that one of the driving pulleys had broken. It was towed in by the Pedey tyre car. Through Bridgwater and Somerton the going was good, but the roads extremely dusty, in contrast to Monday's rain, as bad as it is, dust was preferred. H. E. Haswell (Bradbury) collided with a car and bent his footrest, but continued, whilst nearing Taunton W. Land Dibb (6 h.p. Rex) ran into a wood cart and wrecked his machine, hard luck indeed, as he had lost no marks up to this point. Turning into the Drill Hall yard, Thornton (Swan) ran into the gate and knocked a spectator over.

List of marks lost on Countisbury Hill:

ONE MARK.—P. Grout (4½ h.p. Quadrant) and R. Holloway (Premier).

THREE MARKS.—F. C. Wasley (Douglas), G. B. Fry (3½ h.p. Quadrant), and W. E. Cook (A.S.L.)

FOUR MARKS.—P. Weatherill (3½ h.p. Zenith), J. H. Kerr (3½ h.p. N.S.U.), and J. M. Oakley (Matchless).

A. D. Arter (3½ h.p. James) on Countisbury.

SIX MARKS.—F. C. North (Ariel), J. Haslam (6 h.p. Zenith), W. E. Phillips (Triumph), G. H. Donnelly (4 h.p. Swan), and Miss Hammett (Douglas).

NINE MARKS.—Mrs. Hardee (P. and M.) and Hugh Gibson (Bradbury sidecar).

SIXTEEN MARKS.—L. Newey (3½ h.p. Ariel).

The slowest ascents in the motor bicycle class were by A. R. Penny (2½ A.J.S.), 10m. 26s., and Geo. Cocker (2½ h.p. Singer), 10m. 3s.

In the passenger the slowest were A. J. Stevens (A.J.S.), 17m. 5s., and J. R. Haswell (3½ h.p. Triumph), 13m. 35s.

#### Third Day, Wednesday.

Taunton, Bridgwater, Cheddar Gorge, Bristol, Birdlip, Cirencester, Malmesbury, Chippingham, Bath, and Wells. Distance, 196½ miles.

The morning was dull, and the weather appeared showery, while the roads were very wet owing to heavy rain in the early hours. As this was the longest day, the men were started in pairs, a practice which might well be followed on most days, save on those on which very narrow roads have to be traversed. As it was only seven miles to the surprise hill of the morning, an early start was made. We soon overtook the two ladies, who were greeted in all the villages with cheers. Abbott, however, seemed in a hurry, so he had to be overtaken, as we were bent on observing the ascents of all the competitors. Major Nicholl, whose Clyno

Two A.C. sociables in the check at the bottom of Telegraph Hill.

## A.C.U. Six Days' Trials.—out

H. C. Mills, (3½ h.p. Green-Precision) ready to start.

was temporarily *hors de combat* owing to tyre troubles, borrowed Loughborough's Matchless, and as he was on duty as observer, he pushed ahead, and was just in front of us on the steepest part of the hill when the back tyre suddenly collapsed.

The hill is approached by a sharp rise, followed immediately by an acute corner; then the gradient eases for a stretch, and culminates in a section of about 1 in 6, followed by a long and fairly easy gradient. The surface was wet at first, but became very greasy later on.

The following competitors climbed the hill successfully:

Mrs. Hardee (P. and M.), Miss Hammett (Douglas), Abbott (Bradbury), Herdman (Rudge), Catt (Triumph), Kerr (N.S.U.), Dr. Moss-Blundell (Corah), Haswell (Bradbury), Holloway (Premier), Peachey (Swift), Watson (Swift), Haslam (Zenith), Oliphant (Premier), Griffith (Zenith), Little (Premier), Brough (Brough), Weatherill (Zenith), Berwick (New Hudson), Mundy (Quadrant), Dixon (New Hudson), Cocker (Singer), Morris (Zenith), who skidded slightly, Bah-

The Scott Team climbing Countisbury Hill, Frank Philipp leading.

ington (Bat), Wilberforce (Douglas), Castagnoli (L.M.C.), Donnelly (Swan), Thornton (Swan), Hunt (Campion), Gibb (Douglas), Evans (Humber), Dixon (Singer), Phillips (Triumph)—the latter is a member of the Taunton Club; he is of quite an unmechanical turn of mind, so we are informed, and yet he has gone so far without losing a mark—South (Rudge), McMinnies (Triumph), Pratt (O.K.), Pratt (P. and M.), Penny (A.J.S.), Shaw (P. and M.), Mills (Green-Precision), Sirrett (Indian), Spruille (P. and M.), Drake (P. and M.), Hill (Indian), C. T. Newsome (Rover), Noble (Rover), Scott (Rudge), Spraxton (Rover), Phillips (Douglas), Newey (Ariel), Sangster (Ariel), North (Ariel), Brown (James), Arter and Pollock (James), Crawley (Triumph), Holroyd (Motosacoche), Newsome and Hardee (Triumph), Wells (Bradbury), Moffat (Douglas), Platt (Bradbury), Clarke (A.J.S.), Soresby (L.M.C.), Haddock (A.J.S.), Corke (A.J.S.), Philipp, Baker, and Longfield (Scott), Sawyer (Premier), Dickson (Zenith), Dickson (Indian), Collier (Matchless sc.), Tassell (Matchless), Guest (Matchless), Haswell (Triumph sc.), Colver (Enfield sc.), Wood and Keiler (G.W.K.), F. Smith (Clyno), R. C. Davis (Chater-Lea sc.), Gibson (Bradbury sc.), Jameson (Enfield), Morgan (Morgan runabout), Stevens (A.J.S. sc.)

The following competitors were unsuccessful:

Cass (Quadrant), plug blew out; Alexander (Indian), Grant (Quadrant), Wasley (Douglas), Fenn (Humber), broke a piston at the foot of the hill and retired; Fry (Quadrant), Cooke (A.S.L.), Nott (Matchless sc.), clutch slipping.

Cotthelston Hill occurred in the 43½ miles non-stop section.

Three competitors in Cheddar Gorge.

A descent followed into Bridgwater, and a long stretch of fairly level road brought us to Cheddar Gorge. Spectators were gathered here in large numbers, quite a crowd being on the banks at the worst bend, which is also the steepest part of the Gorge. Cheddar is not a stiff climb, but it tried some of the passenger machines fairly well, particularly the single-cylindere sidecars.

### The Ascent of Cheddar Gorge.

Most competitors climbed the Gorge satisfactorily. Miss Hammett was first up, followed by Mrs. Hardee. They received an ovation for particularly neat ascents. A. H. Alexander again came to a standstill. He is having bad luck; he attributes his failure to the assembling of his engine, for the timing is wrong. He cannot rectify the trouble in running time, as the timing gear is in the crank case. Another who stopped on the difficult S bend was J. Munday (A.C.), whose compression tap blew out with a loud report. A few miles further on, the non-stop section of 43½ miles from Taunton ended at Wellsday Inn. From that point nothing in the form of serious gradients occurred till Dundry Hill was reached.

The traffic of Bristol city is usually most difficult to negotiate, but, thanks to good directions, the assistance of the police and boy scouts, the route was easily followed over Clifton Down on to the Gloucester Road at Filton. Soon after Filton, down fell the rain, drenching roads and competitors. At Falfield the main road was left and a hilly course followed over the Cotswold range into Gloucester, with glorious views of the Severn and Bristol Channel. On the steep hill out of Falfield W. Heaton and L. A. Bees were seen stopped. The rain had rendered the surface very treacherous on parts of this section.

(Left) Frank Philipp (Scott), (right) W. Heaton (A.J.S.) at top of Chellia Gorge.

Lunch was served at the Bell, Gloucester, and the checking and timing arrangements being under the control of Mr. A. G. Reynolds was a guarantee of their being well carried out. J. Cocker (2½ h.p. Singer) had to change a plug a few hundred yards from the restart. After lunch Birdlip was ascended, this well-known acclivity accounting for more failures than it should have done, considering its notoriety and the knowledge most competitors have of its gradient and severity. A few miles from Birdlip summit we saw Pollock (James) adjusting his machine by the roadside; also R. H. Wells (Bradbury). Beyond Birdlip

there was little to interfere with the modern motor cycle of almost any power. Rain fell at intervals nearly all the afternoon, the storms between Bath and Chewton Mendip being particularly severe. The cold for the time of year was felt keenly, and commented on by all. The route from Birdlip was through Cirencester, Malmesbury, Chippenham, Bath, over the Mendips (where there were some fairly stiff ascents and descents), through Wells and Glastonbury to Taunton.

### Greenore Check.

At Greenore check, near Wells, a good deal that was of interest could be learned. The check was outside an inn which bore the curious sign, "Ne Nimium" ("Not too Much"). Shortly after our arrival just before Abbott, who evidently was afraid of being late, the rain came down in torrents, and it was very cold. Garrey (Swan) lost a bolt out of his clutch rod. Donnelly (Swan) skidded in Bath, and damaged the side plate of the frame. In Bath also a competitor side-slipped and bumped into W. Pratt, who in turn cannoned off and knocked a butcher boy over who was riding a carrier tricycle. Mills suffered a puncture. Evans's Humber and the P. and M.'s were conspicuous for their clean crank cases. Someone had bumped into Grout's machine while it was jacked up by the roadside and bent the stand. Dr. Moss Blundell had a spill in Gloucester and another in Bath, bent and damaged the chain guards, tore out the exhaust lifter, and as a result he had to put in two hours' work straightening things up. R. C. O. Wells had magneto trouble, and took out his plug and dismounted his carburetter in looking for it. He thought he had traced the trouble to the high-tension carbon brush, and just as he was starting he noticed his front tyre was flat. Guest pulled the valve out of his back tyre. Baker wore an apron on his Scott, and kept himself beautifully warm and dry. Mud was flying about, so Frank Smith cleaned his float chamber as a precaution. On the way home, Morgan was seen with the bonnet open in Glastonbury. Stugster, who, like several others, had lost a filler cap, was apparently suffering valve trouble five miles from Taunton, and about two miles from the finish Jones had a puncture. The road back was lumpy, and over Sedgemoor there were several

Three competitors at a check. The machines are a Bradbury and two twin Zeniths.

## A.C.U. Six Days' Trials.—

bad *dos d'ânes*. A dangerous bridge, one and a half miles from Glastonbury, marked by a red lamp, required caution, and at Burrow Bridge the tollgate, with which anyone who was unwarned might easily collide, came as a surprise to the competitors. A red lamp gave notice of our approach to it, and Major Lloyd gave warning at the Greenore check of both the above-mentioned dangers. The rain fortunately cleared off before Taunton, which was reached before dark.

Sixteen miles from Taunton we came across J. Oliphant (Premier), whose Sturmey-Archer gear locking arrangement had turned in the fork end and broken the frame; he had to abandon the machine, and H. Colver very kindly took him into Taunton on his Enfield sidecar.

Near the finish, W. B. Little (Premier) ran out of petrol, and enquiring for paraffin at a neighbouring cottage was surprised and pleased to learn that the occupant had a small supply of petrol.

Several riders finished on flat tyres, including Miss Hammett (Douglas), who changed a cover during the day, F. C. North (Ariel), and "No. 13," P. Shaw (P. and M.).

The competitors presented a sorry sight at the finish; for they had had alternately extremely dusty roads, then pouring rain—a combination which tested the most hardened spirits. The ladies, however—there are several on the passenger machines—were no more perturbed by the adverse weather than some of the men. Although they had been despatched in pairs for Wednesday's long run, it was dark before the back-markers checked in. Several arrived very late, including Dr. Moss Blundell (Corah). Punctures had been the chief trouble during the day, though the wet found out weak spots in the ignition system, and skids were

E. P. Dickson (6 h.p. Zenith) ascending Countisbury Hill. The photo is taken from the bank almost directly above.

not unknown. At the replenishment depot—which was very systematically arranged—an attendant put oil into Owen-Wells's petrol tank. This was the last straw, as that rider had suffered innumerable troubles during the day, but stuck gamely to his task.

A. H. Alexanier (3½ h.p. Indian) and J. F. Sirett (7 h.p. Indian) in Cheddar Gorge. Alexanier's Indian was reported to be wrongly timed.

A competitor descending Porlock.

**Fourth Day, Thursday.**

Out and home from Taunton through Somerset lanes, see maps in last week's issue, page 929. Distance, 154½ miles. A secret course until the morning of the fourth day.

"The brave old Duke of York, he had ten thousand men, First he marched them up a hill, then marched them down again."

Thus did the Auto-Cycle Union with the survivors of the trial on Thursday last. The route was a maze of turnings and surprise hills, and single figure gradients were common objects of the country side. Before lunch the district west of Taunton was covered. We left betimes this morning the start was at 7 a.m., and our destination was Collier's Hill, where we were asked to officiate as observer. The weather was dull and threatening, and the roads were wet with recently fallen rain. The way out of Taunton was shown by boy scouts, and every corner was marked both with arrows and confetti. Soon the arrows turned us off the main roads and lanes were traversed which were narrow, rough, and greasy, and both winding and steep. A hill beyond Rowford was a forecast of what was to come. Then the surface became even worse, and finally there ensued a steep descent, at the foot of which there was a sharp corner—the awkward approach to Collier's Hill. The surface here was excellent, and the gradient was no worse than 1 in 5½. Nearly everybody made a clean ascent; Mrs. Hardee led the van as usual and made a splendid climb. It now began to rain and never ceased at this particular spot, a heavy downpour alternating with a Scotch mist.

Despite the inclemency of the weather, Morris (Zenith) wore no cap. Grout (Quadrant) failed, and as his low gear was jammed the intermediate (5 to 1) was too high for the gradient. Knowing the nature of the route Grout decided to retire. Wasley (Douglas) dismounted owing to his petrol tap being turned off. Baker (Scott), being unaware that an obscured hill was confronting him, stopped at the foot to pump his front tyre. Mills (Green-Precision) came up well as usual, but by way of a lark pretended to pedal. Our assistant observed, and entered in his notebook in all seriousness that he had employed this form of assistance. Platts (Bradbury) had a bad squeak when the top gear was in engagement. Kerr (N.S.U.) stopped owing to too slack a belt. Miss Hammett arrived very late, as she changed a cover in the garage. A mile or two after Collier's Hill there are cross roads where the arrows clearly showed the way, but at one point a little farther on one of these must have pointed in the wrong direction as several men climbed Cothelstone Hill twice.

After Cothelstone the route lay through Pagborough and Watts House to a watersplash near Elwerthy on the road leading to Raleigh Inn. The water was not deep, but the ford was followed by a hill of approximately 1 in 12. W. D. South (Rudge Multi) came to a standstill owing to his belt being saturated with water. J. Peachy (Swift) also stopped owing to the water and a rich alluvial deposit on his magneto. The water put out Hugh Gibson's magneto like snuffing a candle. Through Washford to Dunster the road continued ever winding and undulating. There were few incidents to record, though several skids were reported. P. J. Evans took a toss over the handle-bars, breaking his watch and chain and at the same time losing a gold medal, which he would very much like restored to him. At last J. R. Haswell had to give up his plucky attempt to take the experimental three-speed Triumph through such a severe trial. He has had trouble all along in changing down to the low gear; this action first causing the back wheel to skid along and then suddenly taking the bit between its teeth. Naturally something must give way under such conditions, and Haswell himself predicted an early withdrawal. It came to-day as the low gear dogs were sheared off leaving him with but two effective speeds. He could plod along in this manner, but the ascent of Porlock on Saturday would have proved too much for him with the 16 to 1 ratio inoperative, so he retired. Wheddon Cross to Bampton was the next section, but this provided no severe test.

**Twenty-four Failures on Byber's Hill.**

Byber's Hill, Waterrow, was the real test of the morning, and this climb accounted for twenty-four failures. The gradients were kindly supplied to us by Captain Davidson, R.E., who was an interested spectator. Beginning with a short easy stretch, followed by a right-angled turn to the left, when the bend is negotiated the steepest part, averaging 1 in 4½, is encountered. Small loose granite rendered a firm grip for the wheels impossible, and several failures were due to this cause. After the steep section the hill eases off to 1 in 8, culminating with a hundred yards of 1 in 7. Quite a crowd assembled here in the anticipation of seeing fun, and they were not disappointed. Before referring to the performances, we think it necessary to draw attention to the lack of judgment of some of the competitors, both on this and other hills. Knowing full well by the crowd at the corner that something good was in store, many were foolish enough to round the bend on top gear, and then lost way in changing down, their engines having no chance to pick up.

The Morgan Runabout starting the ascent of Byber's Hill.

### A C.U. Six Days' Trials.—

Mrs. Hardee (P. and M.) led, as before, but paddled with her feet, though apparently her engine had ample power. H. G. Dixon (New Hudson), G. Brough (6 h.p. Brough), and J. F. Siret (Indian) shone conspicuously, all three making use of their top gears on the easy stages. Mundy (Quadrant) just got up by skilful jockeying. Babington (Bat) succeeded, though his engine was misfiring. Miss Hammett (Douglas) changed gear too late, whilst C. L. Scott (Rudge) had hard luck in breaking his belt in sight of the top. A. J. Dixon (Singer) made a clean and fast ascent, though his stand was trailing. Really easy climbs were made by Noble and Spruston (Rovers), and Holroyd (Motosacoche), who went up in a bunch, Newsome (Rover), and the James trio—Arter, Pollock, and Brown. This team, with the A.J.S., Scott, and P. and M. riders, can always be relied upon for clean and sure ascents, and their consistency is the main topic of conversation when a hill-climb is in progress. Crawley and Newsome on their Triumphs, Holloway and Little (Premiers), are also competitors who are as sure on hills as it is possible for any rider to be; the first-named was as fast as anyone on Pyber's Hill, passing three or four others on his way up. Wilberforce, after rounding the bend, charged the bank and tore a finger nail off, which caused him to faint. Recovering in about fifteen minutes, he made one of the best ascents of the day on his Douglas. G. H. Donnelly (Swan) failed, and in remounting charged the bank, but did no real damage. Penny and Corke (A.J.S.) were not up to form, for they had their first stops recorded against them. Greaves (Enfield) also stopped, though having seen him climb Barbrook one would have thought that no hill was too steep for his little twin. W. E. Phillips (Triumph) was appalled by the gradient facing him after rounding the bend, and came to a standstill. The Ariels—Sangster, North, and Newey up—climbed well, and the Douglases ridden by Fletcher and Moffatt made excellent ascents. Hardee (Triumph) got to the hill summit, but noticed his engine pulley running eccentrically. Investigation at the top proved that one of the flywheels had come loose, so he reluctantly withdrew, though he had not up to this point a single mark against his name. Platt's Bradbury passed issuing an ominous squeak. W. E. Cook (A.S.L.) changed gear too late and stopped. Abbott (Bradbury) almost stood still, but picked up in surprising fashion and made a clean ascent. P. Weatherill and Griffiths, on Zeniths, went up well, but Haslam was not so fortunate, as he skidded in the loose stones, narrowly missed a group of spectators, and bumped his head on the ground. Thornton (Swan) was balked on his first attempt, but did well next time. Catt (Triumph) travelled excellently. S. K. Jones's L.M.C. made light of the steepest section.

### The Passenger Machines.

The passenger mounts were eagerly awaited. First Frank Smith (Clyno) showed the way, and was applauded for a good show. Colver (Enfield) went over the crest very neatly, also Jameson on a similar turnout. The silent running G.W.K.'s got up well, but the driving wheels were inclined to slip. Munday's A.C. actually stopped with the back wheel churning a deep rut in the stones. Gibson skilfully piloted his Bradbury sidecar. Stevens (A.J.S.) made a sure ascent as usual, though he was overhauled by the Morgan runabout. It was left to C. R. Collier to make the fastest climb, to all appearances, on his Matchless. Tassell (Matchless) was slow, but sure; but G. Nott stopped, and next time thrilled the spectators and came near to wrecking his machine. Rounding the bend at a good 20 m.p.h.—an impossible speed—the sidecar lifted in the air, and, coming down with a bump, threw out Mrs. Nott on one side and the driver on the other, the machine turning turtle without suffering the slightest damage. Undaunted, the plucky pair tried again, and nearly repeated the performance, the sidecar wheel being a foot in the air all the way round the bend. Guest (Matchless) did well. Dr. Moss Blundell (who was late) ran on to the grass at the roadside, but cleverly recovered, and got up well. Later in the day continual chain breakages, gear trouble, and the result of yesterday's fall caused him to retire, which was hard luck as his machine had been travelling well.

It was noticed that several who started on Thursday morning were missing at Pyber's Hill, the constant rain and the severe nature of the course telling their tale unmistakably.

It was at first arranged to climb another steep ascent in this neighbourhood, which meant passing through a deep water splash near Chipstable. Though a temporary bridge was specially erected, it was at the last moment decided to cut this section out.

Just outside Milverton there was another steep observed ascent, which proved the undoing of Frank Smith, who ran out of petrol and came to a standstill.

After lunch at Clarke's Hotel the main road to Wellington was followed, then ensued more lane work, but the surface was good until the foot of Buckland Hill was reached, where the road was very loose, and at this point several of the men had to dismount as the corner was sharp and the arrow was not seen until one was almost on it. Among these unfortunates was Cass (Quadrant), and Evans (Humber) was reported to have had a tumble. The Blackdown Hills had to be climbed three times in all, and in every case this necessitated a long climb, but in no case was the gradient worse than 1 in 5. Perhaps the stiffest of these (in the sense that it required the most skill to negotiate) was Monument Hill, which finished with three lacets. The only failure was Tassell (Matchless), who stopped through belt trouble. We watched a certain number of the men on all three ascents, finishing up with Corfe Hill, which was a good test for

V. Wilberforce (Douglas) has a fall on Pyber's Hill.

colonial models as it began with corners and steep pitches. The surface was roughish at first, but it became more and more grass-grown, culminating in ruts, a fairly deep water course, and finally a steep pitch leading on to the high road. Each of these hills was over a mile long, but failures were few, Wells's being the only one recorded on Corfe Hill. The next section of interest was between Churchingford and Bishop's Wood, where there were several hills to be negotiated. Thereafter all was plain sailing through Ilminster to Langport. One mile from the latter place a turn to the right was taken and a bad road with many greasy patches had to be negotiated until the foot of Red Hill was reached, immediately at the foot of which thick mud covered the road for several yards.

The hill possessed several bends but few failures were recorded. Among these was Miss Hammett, who again misjudged her speed-changing and tried to engage the top too early. The remainder of the run was over easy roads to Taunton. Near the finish Bees (L.M.C.), who had time to spare, was seen cleaning his machine with a bucket of water and a rag. During the afternoon Wood (G.W.K.), who had not lost a mark, stripped a tooth in the differential gear and had to withdraw.

Reg. Holloway (3½ h.p. Premier) at the top of the 1 in 4½ section of Byber's Hill.

Further retirements on Thursday were as under: P. Grout (Quadrant), low gear jammed; A. H. Alexander (Indian) engine wrongly timed; and G. H. Donnelly (4 Swan), frame twisted.

### Smoking Concert.

On the evening of Thursday a smoking concert was organised by the Taunton and District M.C.C., at which all the competitors, officials, and many local motorists attended. Col. Boles presided, and later on in the evening the Mayor of Taunton took the chair. The entertainment was of the best and was much appreciated. There was some slight disorder in the centre of the room caused by certain motor cyclists whose spirits often got the better of their discretion, otherwise the concert would have passed off without a hitch. Rear-Admiral Sir R. K. Arbuthnot proposed a vote of thanks to the Mayor, who made a brief but excellent speech, mildly rebuking the originators of the disturbance, which he diplomatically and jokingly attributed to the invigorating air of Taunton.

### Some Protests and the Result

Numerous protests were received by the committee against marks being deducted from competitors who exceeded the time limit in the garage in the morning. It was found that the rule governing the question of the time to be spent on the machines previous to starting had in some cases been too leniently exercised, and in consequence an announcement was made to the effect that the marks lost up to Thursday would be cancelled, but the rule would be rigidly enforced on Friday and Saturday.

### Fifth Day, Friday.

Bournemouth and back. Outward journey: Crewkerne, Dorchester, Weymouth, lunch at Bournemouth, returning through Blandford, Sherborne, Yeovil, and Ilminster. Distance 150½ miles.

From the contour in the official programme, Friday's run promised to be the easiest of the six, and thus it proved but for two or three hours' rain. More hills were descended than ascended, and we are confident it would have been more strenuous if the course had been followed in the reverse direction. The several retirements of Friday left in the running this morning eighty-nine starters. Through Chard and then Crewkerne the course led to Weyyards Gap, which was to be the second slow hill-climb. There were some exceedingly slow ascents on this hill, but the gradient was not steep enough. Lengthening the measured stretch to two miles helped to test the cool running qualities of the engines more severely. Holloway (Premier) seemed as slow as anyone, though Frank Philipp appeared especially anxious to win the prize, for he travelled slowly and swayed from one side of the road to the other. Corke (A.J.S.) and others followed suit. P. D. Walker's Rudge ran hot, and he had perforce to dismount. The passenger machines were again at an advantage owing to their stability. G. Nott (Matchless sidecar) ran hot and stopped. E. Dickson (Indian) and Newsome and Crawley's Triumphs were also noticeably slow, but as the ascent was so easy we continued our way over undulating roads ever twisty to Dorchester, where crowds were as usual assembled at street corners. Incidentally we may observe that the blue covered journal containing a list of the competitors with their numbers was greatly in evidence here, as in most other towns passed through. At the top of Ridgway Hill, Upwey, a magnificent view of the coastline was obtainable, with Weymouth on the right and several warships in the bay. No doubt this sight at once attracted the attention of Rear-Admiral Sir R. K. Arbuthnot, Bart., R.N., who was a few minutes ahead of us on his Triumph. On this section we were in close company with the Scott riders, whose smooth running machines so greatly impress the villagers and townspeople. If they have a fault it is their propensities for smoking. The Rover team, too, may yet be in the running after Porlock. They are sure hill-climbers, and have gained full marks to date.

### A Fall on a Bend.

Skirting Weymouth by a hairpin corner at the entrance to the town, the riders ran along the coast to Warmwell. On this hairpin, Mrs. Hardee suffered a fall. The vivacious Hal Hill was officiating at the check. His first remark to the writer was "Well, fancy riding a P. and M.!" Of course it is well known that Hal Hill is a member of that sporting section who must have a big T.T. twin, fitted with overhead valves, and making a big noise. Let him, we would not change! On such an easy course it was no surprise that incidents were rare, the puncture fiend, however, was ever present. The Bradbury team riders were going much better to-day. Platt had got rid of that irritating squeak, and they had a no-trouble run. S. K. Jones and L. A. Bæes have been noticed as running very consistently, and this evening's topic has been almost solely concerning the final tithits on

F. C. North (Ariel) rounding the bend at the hill foot. The steepest section of 1 in 4½ follows.

CLIMBING BYBER'S HILL, WATERROW.  
H. Be- (New Hudson) going well. The few Hudson riders were usually fast on hills.

P. W. Moffatt (Douglas) nearing the summit.

### Winyards Gap Slow Hill-climb.

The following are the results of the slow hill-climb on Winyards Gap, near Crewkerne:

#### MOTOR BICYCLE CLASS.

1. G. L. Fletcher (Douglas) ... 23m. 4s.
2. S. Crawley (Triumph) ... 22m. 30s.
3. J. Cocker (Singer) ... 21m. 36s.

Marks lost for exceeding 12 miles an hour: Mrs. Hardee (P. and M.), 6; S. K. Jones (L.M.C.), 8; Haswell (Bradbury), 5; and Miss Hammett (Douglas), 5.

#### PASSENGER CLASS.

1. A. J. Stevens (5 A.J.S. sc.) ... 26m. 46s.
2. R. E. Guest (7 Matchless sc.) ... 22m. 39s.
3. R. C. Davis (7 Chater-Lea sc.) ... 16m. 27s.

J. Peachey (Swift) and P. D. Walker (Rudge) failed, and in consequence lost 10 marks each.

### Sixth Day, Saturday.

Saturday, Taunton to Exeter and back, *via* Dunster, Porlock, Lynmouth, South Molton, Tiverton, Sidford, Bridport, and Crewkerne. Distance, 167 miles.

In order to avoid the coaching traffic on Porlock a very early start was made on Saturday morning. The first man was sent off at 5 a.m., and when we started it was just light enough to see without lamps. The road was greasy at first but improved later, and the going was quite good from

G. Griffith (6 h.p. Zenith) suffers his one and only puncture on Friday afternoon. One of "The Motor Cycle" representatives watching the tube changed.

Saturday, "Porlock and Lynton." It is generally expected that these two notorious climbs will settle the issue in the team award and special cups.

Lunch was taken at the Central Hotel, Bournemouth, the morning's run being about eighty miles. During the interval rain began to fall and continued until Sherborne, once more rendering the pot-hole roads a mass of surface water. Through Yeovil to Ilminster the going greatly improved, and residents evinced surprise at the mud hespattered riders bedecked in oilskins when they had seen no rain at all. A few miles from home we caught up Griffith (Zenith) who had suffered the first puncture, a screw penetrating the rear Pedley cover. A lightning repair did not benefit him, for he had to stop again two miles further on. With five minutes to go he had four miles to cover, and it suffices to say that he did it, thanks to the speed and power of his 6 h.p. Jap. Mrs. Hardee (P. and M.) and Miss Hammett (Douglas) rode side by side most of the afternoon. They had good luck and were always in front rather than behind time. G. B. Fry (Quadrant) retired owing to water in the magneto, and Thornton (Swan) also withdrew.

The second slow climb up Winyards Gap. F. J. Watson (Swift) passing a gun carriage of the Wolverhampton Royal Engineers (T.) Territorials.

G. L. Fletcher (2½ h.p. Douglas) climbing Curry River.

Williton to the outskirts of Minehead. Mr. A. H. Priestley on his Rex-Jap sidecar led the way, and during the journey, though the day was young, numerous motor cyclists, some of whom rode machines of ancient pattern, were encountered on their way to see the most striking hill-climb of the Six Days' Trial. Johnny Gibson, who rode his Trump-Jap out to the hill-climb, had a nasty fall where an official signalled the beginning of the non-stop section, but though he hurt himself somewhat, he, fortunately, did not injure the wound in his head, the result of his accident in the Isle of Man, which is not yet healed. Porlock Hill was in a most appalling condition. No hill ever ascended in a Six Days' Trial has ever presented such enormous difficulties. The higher one went the worse the surface became. It was bad at the first bend, fearful at the second, and above a sea of mud from four to eight inches deep, with not a strip of even reasonable surface on which to ride. In most places one could hardly obtain foothold, and how any rider could make a clean ascent was a puzzle to every one. There was a large crowd of spectators, most of whom concentrated on the second bend. Up to this point only was the hill officially observed. Owing to the length of the hill it was impossible for one man to carry out the observation of the riders, so the two representatives of *The Motor Cycle* were stationed one at each bad corner, and this report is compiled from the notes of both. Wells (Bradbury) stopped between the two corners, and Newsome (Triumph) pulled up, but restarted. Mrs. Hardee

TWO ASPECTS OF THE SECOND AND MOST DIFFICULT BEND ON PORLOCK.

N. O. Soresby (L.M.C.)

P. Philipp (Douglas).

(P. and M.) made a particularly plucky attempt, but skidded in the mud. Sawyer (Premier) fell, likewise Heaton (A.J.S.).

It was agreed to allow paddling with the feet without penalisation, owing to the abnormal surface encountered. Several competitors, however, made absolutely clean ascents, and these were Newsome (Rover), Noble (Rover), North (Ariel), Pollock (James), Corke (A.J.S.), and Evans (Humber). The following were recorded as having made successful ascents, though in each of these cases foot assistance was given: Castagnoli (L.M.C.), Sproston (Rover), Pratt (P. and M.), Shaw (P. and M.), Drake (P. and M.), Sproule (P. and M.), Crawley (Triumph), Moffatt (Douglas), Newey (Ariel), Wilberforce (Douglas), Brough (Brough), McMinnies (Triumph), South (Rudge), F. Philipp (Scott), The successful passenger machines were: H. V. Colver (Enfield), Keiller (G.W.K.), Davis (Chater-Lea), Jameson (Enfield), F. Smith (Clyno), Morgan (Morgan), and Guest (Matchless). The lightweight noticeably steered better in the thick mud than the heavy machines, Corke's (5 A.J.S.) proved a handful, but the clever steering of its rider brought it safely round the bends. Evans received loud applause for a particularly fine ascent. Of the passenger machines, the Morgan runabout made a splendid performance and was the only one in which its passenger (Mrs. Morgan who accompanied her husband throughout the trial) was seated in a normal position. The G.W.K. with the wheels bound round with cord carried the passenger on the locker at the stern of the vehicle.

#### A Foolish Spectator.

The failures were interesting and afforded considerable excitement. Mundy skidded round, kept his seat, and proceeded to descend, but was reminded by an official that he must proceed up and not down the hill; Haswell (Bradbury) ran into a labourer who, despite Priestley's persistent warning, was standing in a dangerous position, but fortunately neither was hurt. Just above the first corner there was a bay into which the failures could conveniently be pushed and their wait till their owners were ready to proceed. Many of the men came up quite fast to the first bend, and more often than not too fast and skidded. Herdman (Rudge) fell into the hedge, Catt (Triumph) tried to get up by means of excessive clutch slipping and failed, Phillips's Triumph ran into the bay mentioned above. At the first bend several even of the successful men skidded in the most alarming manner, among them McMinnies and Pollock (James). Tassell and Collier, in company with the other Matchless riders, wound cord round their tyres in order to obtain greater adhesion. Tassell was travelling well past the first corner when the cord broke, wound round the rear guard, and stopped the machine, also damaging the tyre, and similar trouble happened to Collier at the second corner, and in

each case valuable time was lost in setting matters right. Sangster (Ariel) unfortunately just stopped his road wheel though he restarted without assistance, Dickson (7 Indian) stopped in the same position as the majority, namely, inside the second bend, Bees (L.M.C.), like many others, had plenty of power, but stopped in the thick mud. Philipp, who was travelling splendidly and without the sign of a skid lower down, was baulked by Miss Hammett, and a collision seemed a certainty, but they managed to keep their engines running and got away in good form. Miss Hammett had stopped after the first bend. Soresby (L.M.C.) treated the spectators to a marvellous exhibition of trick riding, his machine skidding from one side to the other. The two privately owned Scotts (Baker and Longfield) skidded, although their engines never faltered. The latter charged an almost perpendicular bank and fell under his machine. Holloway (Premier) and Dixon (Singer) got into a rut between the bends and stopped, but restarted and completed the climb. Haslam and Griffith (Zeniths) stopped almost side by side below the second corner. Babbington (Bat) took the bend in a particularly skilful manner. Little (Premier) ran into the side of the road, stopped his road wheels on a bump, and restarted without leaving the saddle. Brough, as usual, made a clean ascent.

H. F. S. Morgan with Mrs. Morgan as passenger on the second bend on Porlock. The Morgan runabout gained a special cup for the best passenger climb up this hill.

Frank Smith (three-speed Clyno) passing unsuccessful competitors on Lynton Hill. It will be remembered that Smith was the first to climb Lynton on a sidecar.

C. R. Collier (Matchless) hugging the wall on Lynton Hill. His back tyre refused to grip on the steepest part.

Splendid assistance was rendered by Mr. O. Collier, a Douglas private owner, who pushed one unsuccessful competitor after another until he was well-nigh exhausted. As regards the team performances, the two complete teams to make successful ascents were the P. and M. and Rover.

#### Special Prizes for Porlock.

Two prizes were offered by Taunton residents—Mr. Marshalsea, of Marshalsea's Garage, and Mr. Powell—to be awarded in any way the A.C.U. thought fit. It was decided to give these to the best performances on Porlock. Mr. Marshalsea's prize was awarded to P. J. Evans (3½ Humber) for the best performance of a solo machine, and Mr. Powell's to H. F. S. Morgan (Morgan runabout) for the best ascent of a machine entered in the passenger class.

A spectator on the hill, who wishes to remain anonymous, was so much impressed with the magnificent pluck shown by the competitors on Porlock that he offered to award a gold medal to every man who made a clean ascent and has not

otherwise earned a gold medal or won either of the above prizes.

#### Over Exmoor to Lynton.

Over terribly bumpy roads to Countisbury, with huge pools of water, the competitors proceeded to the second bonus hill-climb—Lynton Hill, Lynmouth. Near the foot of Countisbury a brake test was arranged, Messrs. Brooker and Sharp suddenly waving a red flag in front of the competitors. The holding rather than the sudden stopping powers of the brakes was more particularly noted. It was permissible to stop in Lynmouth.

#### Performances on Lynton Hill.

The following gained a bonus of twenty-five marks each for making clean ascents of this hill:

Newsome (Rover)	Watson (Swift)
Noble (Rover)	Peachey (Swift)
Sproston (Rover)	Platt (Bradbury)
Wasley (Douglas)	Holloway (Premier)
Scott (Rudge)	Haslam (Zenith)
South (Rudge)	Griffith (Zenith)
Penny (A.J.S.)	Morris (Zenith)
Pratt (P. and M.)	Wilberforce (Douglas)
Shaw (P. and M.)	Castagnoli (L.M.C.)
Drake (P. and M.)	Babington (Bat), retired
Spronle (P. and M.)	Little (Premier)
Sirett (Indian)	Brough (Brough)
Hill (Indian)	Mundy (Quadrant)
Holroyd (Motosacoche)	Berwick (New Hudson)
Newsome (Triumph)	Dixon (New Hudson)
Crawley (Triumph)	E. V. Pratt (O.K.)
Moffatt (Douglas)	McMinnies (Triumph)
Phillips (Douglas)	Garrey (Swan)
North (Ariel)	Gibb (Douglas)
Newey (Ariel)	Dixon (Singer)
Arter (James)	Evans (Humber)
Brown (James)	PASSENGER MACHINES.
Philipp (Scott)	Keiller (G.W.K.)
Baker (Scott)	Jameson (Enfield)
E. D. Dickson (Indian)	Smith (Clyno sc.)
Bees (L.M.C.)	Morgan (Morgan)
Haddock (A.J.S.)	Stevens (Stevens sc.)
Heaton (A.J.S.)	R. C. Davis (Chater-Lea sc.)
Corke (A.J.S.)	

Leaving Maiden Newton. G. Brough (6 h.p. 3-speed Brough) in front.

In the passenger class there was a large percentage of failures, the oolite surface being too greasy for the hack wheel to gain sufficient adhesion. Only six made clean ascents.

# A.C.U. SIX DAY TRIALS.

# PALMER TYRES

Fitted to Mr. F. Smith's  
5-6 h.p. Clyno and Sidecar

**WINS THE MOTOR CYCLING CUP**

FOR

# BEST TYRE PERFORMANCE.

The superiority of Palmer Tyres has been demonstrated by the marvellous way in which they have carried Motor Cycles to victory through many a severe test. Now, side by side with other makes, under official examination, and the severity of a most exacting trial, Palmer Tyres have, by their usual behaviour, proved the truth of our argument that the one and only adequate wheel equipment for the modern machine is a Palmer Tyre. The manufacture of Palmer Tyres advances with the times.

Illustrated Booklet and prices upon application.

H. Mellor Jameson (6 h.p. Enfield sidecar) who gained all possible marks, and was awarded "The Motor Cycle" private owners' cup for best performance on a passenger machine.

### The Luncheon Interval at Exeter.

Lunch was arranged at Exeter, the route being *via* South Molton and Tiverton. Troubles were not yet over. Miss Hammett reported that her carburettor temporarily caught fire, and her belt had also given trouble. Rain had fallen incessantly since the Porlock climb, and penetrated to the interior of the magneto of J. Cocker's Singer. He struggled along gamely for miles, and missed his lunch in order to finish, but finally the magneto gave out altogether, and for the second time in Six Days' Trials Cocker had to retire on the last day; could anyone imagine anything more unlucky? Another who retired at Exeter was Gordon Fletcher. He, too, had seen life on this last eventful morning. First one cylinder gave out, and he continued on the other until No. 2 also stopped firing. He was also in great pain, as he fell on the Taunton tramlines at the start and sprained his shoulder.

### A Strange Incident.

At Bridport, on the last section of all, Wilberforce was descending a hill when an exhaust valve cap came unscrewed and flew into the hedge. A hunt for it proved fruitless, so he procured a brass plug and turned it up to fit in a blacksmith's shop. Trouble was prevalent to the bitter end. W. D. South broke a valve, and was lucky to finish to time.

W. B. Gibb and P. W. Moffatt (2½ h.p. Douglas) chatting with Mr. Douglas, sen., at the finish on Saturday.

George Brough encountered a van broadside on in the roadway and unfortunately hit the wheel and cut his leg. With true British pluck he had it hastily bandaged, and, assisted into the saddle by Berwick and Dixon, he made a non-stop run to the finish, and had to be lifted off the saddle again, but he had accomplished his object—full marks throughout! Eight miles from home Babbington's magneto became saturated inside, and refused to spark. Reluctantly he accepted Admiral Arbuthnot's offer to tow him to Taunton. The crowd at the finish was much amused by his mud-bespattered appearance, dirt having been flung all over him from head to toe by Admiral Arbuthnot's Triumph. R. C. Davis (Chater-Lea), who had lost no marks to date, exceeded his time limit by several hours. His delay was due to water in the magneto on the last stage of the 1,000 miles. Other retirements were G. Nott (Matchless), Phillips, the local rider of a Triumph; Haswell (Bradbury), front wheel bearing trouble; and Sangster (Ariel), valve trouble, which caused him to arrive outside time.

### Re-examination of Machines and Tyres.

On returning all the solo machines using tyres and belts entered for test were taken into the small garage, and there these accessories were removed and the tyres examined to see if they still bore the A.C.U. stamp, and to ascertain their condition, and were weighed. They were weighed before the trial after purchase, and by the amount of weight

A dust layer in Maiden Newton. The competitors are: E. Herdman (Rudge), G. Griffith (Zenith), G. Brough (Brough), and A. E. Catt (Triumph).

lost the degree of wear will be judged. Major Lindsay Lloyd and Mr. H. J. Macnamara were in charge of these arrangements. Some of the tyres were in magnificent condition, and we could not help noticing the rear Pedley cover off Griffith's Zenith, which appeared to be in almost perfect order, and showed little if any wear. The Palmer tyres on Smith's Clyno were equally good, and it was almost impossible for any casual observer to tell the difference between the rear one and a new cover. Hutchinson tyres behaved consistently with their excellent record under similar circumstances. The Stelastic tyres also came through the test well. The Roms on the James machines were in very good condition. The John Bull tyres were also well worthy of notice. The Pedley belt was pre-eminently successful, and the Service belt also behaved well in the wet weather. The machines were examined by the judges early in the morning after the trials had finished. They were, of course, in an extremely dirty condition owing to the dreadful weather experienced. Their condition mechanically was good on the whole, though the following lost marks as under.

F. C. North (Ariel), stand broken, 5 marks lost.

S. Sawyer (Premier), front mudguard clip broken, 5 marks lost.

A. P. Morris (Zenith), back hub out of adjustment, foot-rest broken, 5 marks lost.

G. Brough (Brough), head loose, 5 marks lost.

M. Garrey (Swan), back wheel damaged, frame distorted, 5 marks lost.

## THE OFFICIAL AWARDS.

**The Team Prize.**

For the four-year running Messrs. Phelon and Moore have gained the team prize. Not only did their machines obtain the highest number of marks—3,150—but their appearance throughout the trial aroused favourable comment on all sides. Messrs. Pratt, Shaw, and Drake deserve our heartiest congratulations, and also Mr. Sproule, who gained a gold medal. Each of the three riders mentioned above gains a gold medal, while Mrs. Hardee, the plucky lady rider of a P. and M., is awarded a silver medal.

The Silver Cup, given by Dr. Hes of the Taunton M.C.C. for the best performance of a private owner of a solo machine in the slow hill-climb. Jesse Baker (3½ h.p. Scott). His total time on the two hills was 31.3m.; speed, 5.75 miles an hour.

The silver cup presented by Messrs. Harrisons' Hotels, Ltd., for the best performance of a private owner driving a passenger machine in the slow hill-climbs. J. Tassell (7 h.p. Matchless sc.). Total time on the two hills, 21.35m.; speed, 8.44 miles an hour.

**"The Motor Cycle" Cups.**

The cup presented by *The Motor Cycle* for the best performance of a private owner on a solo machine was awarded to W. G. McMinnies (Triumph), who also gains the cup presented by Col. Boles, M.P., M.F.H., for the same performance. The other private owners' cup presented by *The Motor Cycle* was awarded to H. Mellor Jameson (6 h.p. Enfield sc.), who made the best private owners' passenger performance. Jameson also gains the cup awarded by Mr. T. S. Penny, J.P., for the best private owner passenger performance on the hills.

**Tyre Awards.**

The special tyre prize was awarded to the Palmer Tyre Co. for the set of tyres (26 x 3in.) on F. Smith's Clyno and sc.

The special belt prize was awarded to Messrs. Pedley and Son, set No. 17, used on P. Weatherill's 3½ h.p. Zenith.

**Analysis of Results.**

The following is an analysis of the results:

Phelon and Moore, Ltd., five machines and gained four gold medals, one silver, and team prize.

The Rover Co., Ltd., three machines, gained three gold medals, and came second for team prize.

A. J. Stevens, Ltd., five machines, gained four gold medals and one silver, losing the fifth gold medal by eighteen marks.

Hendee Mfg. Co., four Indians, three gold medals.

Enfield Co., four machines and gained three gold medals,

The winning P. and M. team: in the pouring rain. Left to right: W. Pratt, P. Shaw, and W. C. Drake. P. and M. riders have secured the team prize since 1909 (tying last year)—a wonderful record of excellence and consistency.

one silver, and two special prizes.

Motosacoche, Ltd., entered one machine, and, following their usual practice, gained one gold medal.

Components, Ltd., entered three Ariels and gained two gold and one bronze medal.

James Cycle Co., Ltd., three machines, three gold medals.

Scott Engineering Co., Ltd., three machines and gained three gold medals and one special prize.

Premier Cycle Co., Ltd., five machines, three gold medals.

Zenith Motors, Ltd., five machines and gained two gold and three silver medals.

Lloyd Engineering Co., four machines and gained three gold and one bronze medal.

Swift Co., Ltd., two machines, two gold medals.

Collier and Sons, Ltd., five Matchless machines and gained two gold and one silver medal and a special prize.

G. Brough and Co., one entered and one gold medal.

Green Precision, one entered and one gold medal.

Morgan and Co., one entered and one gold medal and special prize.

The Swan Tear, photographed in the yard of the Drill Hall, Taunton. These machines have open spring frames and pan seats, but were unlucky in the trials.

A.C.U. Six Days' Trials. J. Oliphant and R. Holloway (Premiers) passing Upottery school. Note the enthusiastic onlookers.

### Tyres in the Six Days' Trial.

It is worthy of note that the tyres fitted to the P. and M. team machines ridden by W. Pratt, P. Shaw, and W. C. Drake were Kempshalls. The same tyres were also used to the fourth P. and M. ridden by W. J. M. Sproule.

### Taunton Topics.

J. R. Haswell knew early on Monday that he was in for trouble with his experimental gear. The shell of it ought to revolve forwards on the high gear, backwards on the low gear, and to remain stationary on the middle gear; but on Monday it was revolving forwards all the time. It was hastily assembled late on Saturday night, and when it was finished it was hardly in good trim. But time prevented its being taken down again. ☹

### Some Scottish Notes.

**A JOINT HILL-CLIMB.**—The Scottish Border M.C.C. and the Edinburgh M.C.C. are to hold a joint hill-climb on August 24th at Lanton Hill, near Jedburgh, the place of the Anglo-Scottish matches.

**THE S.A.C.U.**—The Scottish Auto Cycle Union continues to progress rapidly, and there is now no doubt of its claim to the control of Scottish motor cycling. With all the important clubs such as Edinburgh, Glasgow, Perth, etc., giving their support, and only a few minor clubs un-

attached, the Union is in a very strong position. The Union badge is now being issued, and is a striking production with its red lion rampant on a yellow ground. With attractive insurance schemes (includ-

ing an unlimited third party policy for £1), free legal defence, touring and hotel facilities, use of R.A.C. and S.A.C. scouts, etc., it is no wonder that the Scottish clubs are experiencing a great accession to their ranks.

**NO SCOTTISH SHOW.**—An attempt was made to include a motor cycle section in this year's Scottish Motor Show, held in Glasgow last January, but the trade refused their sanction. The Scottish Motor Trade Association hoped, however, to hold a combined motor cycle, industrial vehicle, and motor boat show in Edinburgh next year, but, unfortunately, this also has fallen through, so that Scottish motor cyclists have yet to see a representative selection of modern machines, and this in a country where more motor cycles are owned in proportion to the population than in England.

### The Trade in the United States.

We understand that with the exception of two important firms, which have made exceptional arrangements for quick production, all manufacturers in the States are behind in deliveries and cannot cope with their orders. Several are making additions to their factories and one firm's addition alone will cost about £25,000. We also understand that more than one American firm contemplates building in Canada to escape tariff duties.

THE LAST SEVERE HILL ON THE SIX DAYS' TRIAL ROUTE. R. C. Davis (8 h.p. Chater-Lea sidecar) on the acute bend of Lynton Hill, Lynmouth. This was one of the two bonus hills.

### TIME TO LIGHT LAMPS.

Aug 22nd	...	...	8.8	p.m.
" 24th	...	...	8.3	"
" 26th	...	...	7.59	"
" 28th	...	...	7.55	"

### Saturday at Brooklands.

There is a fine entry for the B.M.C.R.C. meeting at Brooklands next Saturday, a number of prominent riders having entered for the 150 miles race, which is the chief event.

### German Hill-climb.

The results of a hill-climb held near Bavaria recently are: 1, Dietz (1½ Motosacoche); 2, Oberlaender (2½ Motosacoche); 3, Bernstein (2¼ N.S.U.) The fourth and fifth riders also bestrode N.S.U.'s

### French Race Banned.

The motor cycle race announced for next Sunday over the Fontainebleau circuit, and in which it was expected a number of British motor cyclists would take part, will not prove the success anticipated, for the Auto Cycle Union has stepped in and threatened to suspend all British contestants.

The next important race in France is on the 8th prox.

### Northern Speed Trials.

On Saturday last the Rotherham and District M.C.C. held a speed trial over half mile course with the following results: 1, J. Baker (¾ Rudge), 33½s.; 2, L. Shephard (¾ Triumph), 34½s.; 3, Hardwick (¾ Ivy), 42s. Sidecars—1, H. S. Watson (¾ Premier), 4½s.; 2, E. J. Willis (¾ James), 45½s.; Dr. Sedgwick (¾ Humber), 59½s.

### French Clubs and Their Differences.

The delegates of the different French clubs who have refused to recognise the Automobile Club of France as sole ruling power will meet on November 2nd and 3rd at the Moto Club de Lyon's headquarters. At this meeting the calendar for 1913 will be elaborated, and delegates elected to represent France at the International Congress, which is to be held in London at the end of November.

### Range Requests.

Some strange requests hail from overseas. We have just seen an enquiry from a member of a native regiment Southern Nigeria who wants a motor cycle and anticipates that for £7 10s. he will be able to get an up-to-date light-weight engine in such condition that no one would know it from a new machine. Solid tyres are also specified, and on a lightweight! Finally the machine is to be supplied on the easy payment system

### Six Days' Trial in France.

The six days' event (1,500 kilometres) to be organised by the Automobile Club of France next month must, says a recent decision, receive at least fifty entries. "But France will only provide a very small contingent," remarked somebody to an influential member of the A.C.F. "Well, we will fetch the others from England" was the reply. Will the English firms agree though?

### The M.C.F. Grand Prix and Other Races.

The Automobile Club de France, which claims the control of motor cycle events in France, all of which must be run under its rules, has discountenanced the following competitions; the Circuit de Fontainebleau, organised by the Moto Cycle Club de France, to be held on August 25th, and the Paris Tour, to be run by the Touring Moto Club de France on September 29th. Any riders taking part in these events will be suspended by the ruling body. Owing to the agreement existing between the Automobile Club de France and our own Royal Automobile Club, with whom the Auto-Cycle Union works in perfect harmony, the A.C.U. warns British riders against taking part in these events, as should they do so suspension is bound to ensue. The Automobile Club de France is organising a six days' trial early in October, and the Auto-Cycle Union will be happy to undertake the organisation of sending over British riders who wish to compete as far as foreign licences and the journey are concerned.

### Roads Improvement Association.

The above Association has decided to present a petition to the House of Lords against the use of tramcar trailers and coupled tramcars in the Metropolis, as it is thought that these will add very considerably to the congestion and danger of the already thickly trafficked London streets.

### French International Cup Race.

For the above event, which will be run under A.C.F. rules on September 8th-9th, and therefore a race in which British riders may take part without incurring the ban of the R.A.C. and A.C.U., the following entries have been received: Vernon Taylor and Scott (Rudge-Whitworths), Ravelli (Triumph), Grapperon (New Hudson), four Peugeots, three Terrots, two Alcyons, and a Wanderer. In this race motor bicycles with engines exceeding 500 c.c. will not be admitted. Entries should be sent to the Secretary A.C., de la Sarthe au Mans, or L'Auto, 10, rue du Faubourg, Montmartre, Paris.

### A Cross Road Improvement.

A notable improvement has been effected at a dangerous junction of roads at Beckenham, Kent, where four roads meet in the form of a cross. On a signpost erected at the junction a mirror about three feet high and the same width has been fitted. It is of concave form and shows the approaching traffic.

English-Dutch Trial. One of the numerous railway crossings. Observe the gates which are moved vertically.

Geo. Wray's 4 1/2 h.p. Wray-Precision sidecar which has a Bowden countershaft gear.

#### Ferry Charges for Cyclecars.

The A.A. and M.U. are endeavouring to obtain more reasonable charges for cyclecars at ferry crossings. At present such vehicles are being charged full car rates at many ferries, although the charge for motor cycles and sidecars is very much less.

#### Rumours that will not die.

A short time ago we published a denial from the Ford Company stating that they were not building or contemplating a cyclecar. This denial, however, was not sufficient to kill the rumour, for it has again reached our ears in a more definite form than on previous occasions.

#### Rand M.C.C. (Transvaal).

A reliability trial was held recently. Jackson's Drift Hill was officially observed. Result: 1, P. Flook (2 1/2 Chater-Precision), hill-climb 56, reliability 55, total 111; 2, G. Weddell (3 1/2 New Hudson), 51, 52, 103; 3, Coulson (3 1/2 T.T. James), 48, 52 1/2, 100 1/2; 4, Taylor (3 1/2 Indian), 57, 43, 100, and Gwilliam (2 1/2 Douglas), 60, 40, 100, equal.

#### Imports and Exports of Motor Cycles.

The value of the imports of motor cycles and parts has increased by nearly £10,000 in the last two years, this increase being almost entirely in parts. The exports, as usual greatly in excess, have increased by over £44,000 in the same time. The value of these exports for the first seven months of the present year is £325,697, more than four times as great as it was two years ago.

#### Motor Cycles at the Paris Show.

A few weeks ago we published a paragraph stating that no motor cycles would be exhibited at the Paris Salon. This should have read, "no French motor cycles," as we understand that English and foreign firms other than French will exhibit motor cycles. The reason French machines will not be exhibited is because a year or two ago the motor cycle manufacturers agreed not to exhibit in Paris or elsewhere in the Department of the Seine before January, 1913.

FUTURE EVENTS	
Aug. 31.—	Coventry and Warwickshire M.C. Open Hill climb.
31.—	Dublin M.C.C. Open Sidecar Reliability Trial.
Sept. 7.—	Streatham and District Open Hill-climb.
" 7.—	Liverpool M.C.C. Open Reliability Trial.
" 14.—	B.M.C.R.C. Race Meeting.
" 16.—	Edinburgh and District M.C.C. Open Hill-climb on Amulree.
" 21.—	Herts. County M.C.C. Open Hill-climb.
27.—	Birmingham M.C.C. 24 Hours' run to Edinburgh (Open)

#### Coventry Club's Open Hill-climb.

There are already a good number of entries for the seventh open hill-climb of the Coventry and Warwickshire Motor Club on August 31st, entries for which close at ordinary fees to-morrow (Friday). Eight classes are down on the programme. A good proportion of the trade are included among the entries. We understand that the hill chosen is a safe one.

#### The Petrol Committee.

The first interim report is to hand and contains much interesting matter. The committee has been engaged in investigating the methods of handling petrol in this country, and is of opinion that, if the Port of London Authority will allow the transport of consignments of 1,000 tons to pass up the river for local storage, the possibility of shortage owing to labour troubles will be much reduced. The sittings will be renewed in September. Copies of the report may be obtained from Mr. J. W. Orde, Secretary R.A.C., Pall Mall, S.W., at 1s. 2d. post free.

#### Touring and Hotel Charges.

One or two enquiries have reached us from affiliated members of the Auto Cycle Union regarding the use of the officially appointed hotels. It is not made absolutely clear in the A.C.U. handbook that on presentation of the affiliated membership card the reduced tariff at these hotels can be made use of by members of affiliated clubs. These hotels will be found in most instances both well appointed and moderate in charges; apart from this it is a convenience to know exactly what one is going to be charged at an hotel, and such information is clearly set forth in the handbook. In most instances the letters S.B.B.A. appear under the name of each hotel, these signifying supper, bed, breakfast, and attendance. Table d'hôte dinner is not usually included under this heading, and it is advisable to bear it in mind.

H. Colver (6 h.p. Enfield Sidecar) rounding the lower bend on Beggars' Roost. Higher up he unfortunately collided with the bank.

## SIX DAYS' TRIALS NOTES.

N. Soresby was first announced as having made the west ascent of Countisbury Hill on Tuesday; but it was subsequently ascertained that he broke a chain and stopped effect repairs.

It is a distinct score for the A.J.S. to be credited with the slowest ascents of Countisbury Hill, both in the bicycle and passenger classes.

The new baby Norton accompanied the trials riders on several days, F. A. Hardy, the press secretary, being in the saddle.

Petrol supplies were carried out in a systematic way. The Shell Co. supplied competitors, free of charge, and arranged for ample supplies at the mid-day stops. Approximately 1,400 gallons were used. Mr. A. E. Cockerton supervised the arrangements.

Although, as we observed last week, scorching to make up time in case of trouble was permissible, we saw very little real racing. This was due to the competitors riding just within minimum time and thus having twenty minutes in hand for possible delays.

On Wednesday, between Felton and Falfeld, we saw a weird contraption in the shape of a tandem-motor bicycle, with two bucket seats. A heavy downpour drove its occupants to shelter, and as we were on a competing passenger machine we could not stop to examine it. We should imagine it is a risky vehicle on grease.

Some fear was expressed early in the week that competitors would arrive at Taunton after lighting up time. Thanks, however, to careful organisation no man who rode to schedule arrived later than the hour at which lamps have to be lit. The evenings, however, were cloudy and dark, and several had to light their lamps on Wednesday—the longest day's run.

The secret check system has worked well. If a man was late he had, of course, to try and make up time, but those who had no trouble care not push too far ahead for fear of arriving at some unexpected check too early. Thursday was much appreciated, as owing to the tricky course there were no checks. There was a marked difference in the way the men rode on Thursday to that in which they drove on the other days.

Boy Scouts were of inestimable service in directing the way. Several hundred were employed in this manner during the week. Special praise must also be accorded to the police for assistance in guarding cross roads.

How interested were the public in the lady competitors! In all the towns and villages the residents were especially interested in the doings of Mrs. Hardee and Miss Hammett.

Crawley (Triumph) on the first bend of Porlock. He was one of the twenty-six who successfully climbed the hill.

Fifty-nine competitors succeeded in making clean ascents of Beggars' Roost and received the special bonus of twenty-five marks.

The number of retirements on the various days forms interesting reading. The number who gave up on Monday was 11, Tuesday 14, Wednesday 5, Thursday 10, Friday 5, Saturday 4.

Philip Grout, dressed as a Dutchman, caused much amusement by riding through the main streets of Taunton, on Friday evening, on a bone-shaker quite forty years old, the property of a well-known Taunton resident.

One well informed daily paper announced on Wednesday morning that a lady was still leading in the great motor cycle race in which there were 132 competitors!

On Tuesday evening the officials of the Auto Cycle Union were entertained to dinner at Clarke's Hotel (where, by the way, the arrangements have been excellent). Colonel Hles. M.P., M.F.H.) presided, and on his right sat Alderman W. F. Whittingham, Mayor of Taunton. In proposing to toast of the Auto Cycle Union, Colonel Boles referred to the beauty of the country traversed during the trials, to the hills in which he would back against any in the country for going up or coming down. The trials were good not only for the pastime, but helping to encourage a machine to manufacture of which was an adjunct to the trade and business of the country. He coupled with the toast the name of the Rev. E. P. Greenhill. Mr. Greenhill made an excellent speech in reply, and spoke of the great help rendered by members of the Taunton club. Major Lindsay Boyd then proposed success to the Taunton and District A.C.C. The Mayor and Mr. Potter replied, and in his speech the latter referred to the interest taken in the trial by the inhabitants of Taunton. Among those present was Mr. T. Goldsworthy Crump, who has done magnificent work in helping to organise the trials. He is the district surveyor, and was mainly responsible for the route.

H. E. Haswell (B'adbury) skidded into the ditch on the first bend of Porlock, and knocked down a spectator who persisted in standing on the corner.

## Six Days' Trials Notes.—

## The Work of the Officials.

The officials have done their work so well it is almost impossible to give praise to any individual for fear of offending others whose names might by accident be omitted. Grateful thanks must be rendered to Messrs. Potter, Crump, and other members of the Taunton Club to whom the success of the trial is in no small measure due. Major Nicholl spent ten days of a well-earned leave in acting as judge. Mr. Nisbet, as clerk of the course, and general superintendent of affairs, was, of course, splendid. Mr. Macnamara worked hard and effectively, while too much praise cannot be given to Mr. H. A. Cooper, who, after retiring on the first day, devoted the whole of his time to the A.C.U. and rendered invaluable services. Mr. A. H. Priestley, who has had control of the marshalling arrangements, had an important and responsible position, which he filled in a most able manner. The numerous other officials did excellent work, but mention must be made of the untiring efforts of Mr. T. W. Loughborough, whose inexperience in long distance trials work placed him at a disadvantage, but who carried through his task in a most efficient manner, and sight must not be lost of the work of the assistant secretary, Mr. H. P. Beasley.

## Fletcher's Retirement.

On arriving at Taunton on Saturday night Fletcher announced that his engine had been ruined by some miscreant having put sand in his oil tank. The judges carefully examined his engine and found that his statement was absolutely correct. There was no doubt whatever that the foreign matter was silver sand and not road dust. The cylinder and bearings were, in consequence, very badly scored. Of course there is no trace of the originator of this dastardly act, of whom no words can adequately express our opinion.

The trial was a strenuous one for competitors, officials, and pressmen alike. Few averaged more than six hours' sleep, and some much less, owing to the early starts and the immense amount of checking and figures due to the record entry.

## Unruly Behaviour.

It is our unpleasant duty to have to record that on Saturday night there occurred some incidents to which we would rather not refer, but we feel we cannot let such behaviour which was seen on that occasion pass without comment. Fireworks were let off in the bar, a table was smashed, and the conduct of certain people was of a most disorderly nature. Those responsible are few in number, we are happy to say, but some means must be found, and that without delay, to put a stop to such goings on once and for all.

P. J. Evans (3½ h.p. 2-speed Humber) with 1913 kick starter. Evans shone conspicuously throughout, winning a special cup for the best ascent of Porlock, and gaining maximum marks.

Various ingenious owners of obsolete machines, desirous of accompanying the trials, are said to have found some twenty different ways of getting out of Lynmouth.

The machines without sidepieces to the front mudguards were plastered with red mud from end to end, and were at least four times as dirty as the standard patterns.

The observation on the test hills was linx-eyed. One rider thought he had spotted where all the officials were standing, and he furtively gave two lightning dabs with his outside foot. But he found himself penalised fifty marks when the sheet was posted.

One of the judges stored his machine in a public garage. While he was cleaning it one evening, three nefarious competitors entered very furtively, with bits of their machines in their pockets. The garage manager says "Faded" is the only word which adequately describes their exit.

A spectator made a clean ascent of Beggars' Roost on a single geared Triumph on the day of the test. He passed several variably geared competitors struggling to prevent their machines running backwards which was not complimentary to the trials men. Practically everybody stopped to cool at the hill foot.

Several forfeited 5 marks at the foot of Porlock in order to cool their engines.

The secret checks and 20 m.p.h. rule were the chief bugbear of the competitors, who otherwise enjoyed the trial.

G. Nott (Matchless sc.) finished four and a half hours late and lost 212 marks. He was so late that the arrows had been removed and he lost his way.

The surface of Porlock was in such a bad state that the judges talked of ignoring the failures on this ascent, but as 25 were successful in reaching the summit, 50 marks were deducted for failures according to the rules.

Should detachable wheels on passenger machines be barred? The A.C.U. judge's decision was in the affirmative, but detachable wheels seem a feature which should be encouraged.

Beggars' Roost, the steepest hill in England, gradient 1 in 3½, is not nearly steep enough to stop the best motor cycles nowadays. It would really be interesting to know what is the limit of a motor cycle's climbing powers.

Cleaning machines outside checks was again the rule. It is said that a certain chain-driven team carried Selvyt rags and polishing paste. Anyway, their spotless machines did them great credit.

One can especially sympathise with those competitors who retired on the last day.

Saturday's continuous rain penetrated to the interior of several magnetos and put a fullstop to their owners' records.

The 3½ h.p. Humber, ridden by P. J. Evans, which is practically a 1913 model, ran throughout the trial without a single adjustment. The Dunlop belt was not even shortened and the Continental tyres unpunctured. The rear tyre was a steel-studded pattern which accounts for his steadiness on Porlock.

P. and M. riders have not failed to gain the top award since 1909.

A 40 h.p. Daimler, belonging to Mr. Torkington, rendered invaluable service, as also the official 20 h.p. Humber car kindly lent by Humber, Ltd., and ably handled by J. Idicins.

There was great slaughter among the Devon and Somerset fauna: the bag included a fox cub, a hedgehog, a rabbit, a cat, sparrows, and several partridges.

Nearing Taunton each night certain trade riders might be seen riding "hands off" and cleaning their machines with a paraffin brush at 25 m.p.h.

THE PREMIER CYCLE CO., LTD., COVENTRY.

### HIGHEST POSSIBLE MARKS AND FINEST HILL CLIMB.

Made by "STERNOL" Users

in the A.C.U. 6 Days' Trial at Taunton.

22 Riders used "STERNOL"

(Standard Quality Oil)

and completed the 1,000 MILES, of whom10 secured Gold Medals3 obtained Silver MedalsAnd 4 took Bronze Medals

Mr. T. J. Evans, on a 3½ h.p. Humber, secured the highest possible marks (1,050), and made the finest performance up Porlock Hill.

Mr. Corks, on a 5 h.p. A.J.S., secured an extra Gold Medal for performance on the same hill.

This, in addition to the 6 Days' Sidecar Record recently beaten, where "Sternol" Oil was used, is a proof of its sterling quality, which never varies.

Write to-day for particulars and price list.

**STERNOL,**

56, Royal London House,  
Finsbury Square, LONDON, E.C.

L.M.C. chain and belt 2-speed gear.

Kick starter on new 3-speed Humber.

Triumph bottom bracket 3-speed gear, used by J. R. Haswell.

One private owner's language was picturesque on Monday night, when he paused outside control to drain off the waste lubricant. The factory mechanics had fitted his special silencer in such wise that it was impossible to remove the crankcase drain plug.

The Rudge owner who brought to Birdlip an enormous decar resembling a giant vegetable marrow is requested to communicate with the advertising manager of Sutton's seeds, Reading, from whom he will hear of something to his advantage.

The rules say that "passenger machines must ascend the steepest hills with the passenger seated in a normal position." Definitions of "a normal position" by our own representa-

tive: (1.) With her face in the oiler on the far side of the rear hub. (2.) With her toes chocked in the carrier, body horizontally rigid, head 2ft. outside side wheel. (3.) Toes on the seat, body on the carrier, tongue cleaning the back number plate (apparently). (4.) Under the seat (on straight, easy hills only). (5.) Sitting bolt upright, jerking violently in parallelism with driver (on low-powered outfits only).

Some of the three-wheeled cyclecars carried enormous portmanteaux on their back carriers. Four garage attendants, finding one such suit case lying about, endeavoured to lift it. They sent for a steam crane. It is suggested that the A.C.U. supply 56 lbs. weights at the foot of each hill in future. Those single back wheels want a lot of holding down.

The Super, a new belt driven cyclecar of smart design with tandem seats. The engine is a water-cooled Anzani of 8-10 h.p., and there are 16 speeds.

Perrin (Peugeot) winner of the Mont Ventoux hill-climb.

# Another Device for Burning Paraffin.

This apparatus known as the Fear-nought comminuter has been designed by Mr. Griesbach, of the M.G. and G. Motor Patents Syndicate, Ltd. One of the greatest troubles in the use of paraffin for power is pre-ignition, and on that account the compression must not exceed 64 sq. lbs. to the sq. in. Of this fact Mr. Griesbach takes advantage by providing a vaporising or heating chamber off the combustion head of the engine, and the extra compression space thus afforded naturally lowers the compression.

Referring to figure, the fuel is sucked in by the engine at A. It is sucked past the seating of a very lightly-loaded spring valve (the top of the spindle can be seen at B), which prevents its return and then meets with the currents of inspired air that cut right across its flow and break it up. The mixture then flows along the feed tube C, but as this and all the tubing that follows is of small diameter the velocity of the vapour has to be proportionately great. D is the vaporiser, or comminuter, in connection with the combustion head of the cylinder, and therefore the extension of the tube C, which passes through the comminuter.

is surrounded by the hot gases resulting from each cylinder explosion. At this part of its passage, too, the vapour meets a flat strip of metal that has been twisted helically, and is inserted in the extension of the tube C. This acts much as the rifling of a gun acts on a bullet,

and the centrifugal force that it imparts to the particles tends to throw the mixture against the heated walls of the small tube, and still further breaks it up. Finally, still at high velocity, the gas is conducted by the flexible tube E

to the chamber F, which is merely an inverted B. and B. carburettor throttle worked by wires and lever control.

The comminuter itself consists merely of a cast-iron ribbed cylindrical chamber with an offset passage communicating with the cylinder head and clamped down to its seating by the dog G. The offset passage is further extended at H to accommodate the displaced sparking plug.

In addition to preventing condensation, the high velocities of the gases lead to a scouring action being secured on the inner walls of the feed tube, so that there is no deposit, and, though this copper tube is of only 21 gauge, one that has been in work two years as yet shows no signs of giving out.

Mr. Griesbach has fitted his device on a  $3\frac{1}{2}$  h.p. White and Poppe engine, and tells us that it will take him up any hills. In fact, with paraffin, the engine, if anything, seems to develop slightly more power up to speeds of 800 r.p.m., though above that limit naturally the slower combustion of the paraffin begins to tell, and "all out" petrol holds an advantage of 2 or 3 m.p.h. The device can be applied to single or twin engines.

## CLUB NEWS.

### Newcastle and District M.C.

The Gordon-Roberts reliability trial will take place on the 24th and 25th inst. Route, *via* Lanchester, Alston, Penrith, Keswick, Windermere, Kirkstun Pass, Shap, Kirkby Lonsdale, Brough, Barnard Castle, Darlington, and Neville's Cross.

### The Motor Cycling Club.

The awards in the standard reliability and hill-climbing trial, held on the 3rd and 5th inst., are as follow: Silver cup, presented by Mr. H. E. Hull—A. J. Dixon. Gold medals—B. Mariani, L. A. Baddeley, H. Karlslake, D. Popplewell, R. M. Mariani, C. T. Newsome, and A. J. Spruston. Silver medals—R. Charlesworth, G. T. Gray, C. W. Meredith, W. E. Rootes, W. P. Tippet, P. H. Bentley, P. D. Walker, D. S. Baddeley, J. H. Kerr, R. E. Guest, A. da Silveira, R. C. Davis, C. Percival, and G. P. Howe. H. F. S. Morgan was disqualified for being more than 15m. ahead of schedule time.

### Derbyshire and North Stafford A.C. (Motor Cycle Section).

On Saturday, members of the above club held a highly successful hill-climb on Hob Hill, Hazelwood. The weather conditions during the earlier part of the morning were of the worst, but towards noon the road dried up. Competitors were handicapped on trial run times, any competitor reducing his trial time by more than five per cent. being disqualified. This system proved most suitable, as some of the exciting finishes fully testified.

HEAT I.—D. C. Bolton ( $3\frac{1}{2}$  Rudge), bye; H. Russell ( $3\frac{1}{2}$  Bradbury), 4 $\frac{1}{2}$ s.; beat J. A. Marshman (Rudge); E. G. Linnell ( $3\frac{1}{2}$  Bradbury), 10s., beat E. S. Brittain (Triumph); E. Russell ( $3\frac{1}{2}$  Russell), 5s., beat A. F. Greeves (Triumph); C. Smith ( $2\frac{3}{4}$  Douglas) beat T. Newton (Triumph), 3 $\frac{1}{2}$ s.; G. G. Walkdon ( $3\frac{1}{2}$  Bradbury), 11s., beat F. Smith (Douglas).

HEAT II.—H. Russell, 16 $\frac{1}{2}$ s. start, beat D. C. Bolton; E. G. Linnell, 9s. start, beat E. Russell; C. Smith beat G. G. Walkdon 9 $\frac{1}{2}$ s.

FINAL FOR FIRST PLACE.—E. G. Linnell beat H. Russell.

FINAL FOR SECOND PLACE.—H. Russell beat C. Smith.

E. G. Linnell thus takes the silver goblet, and H. Russell a silver medal. Fastest time of the day was made by D. C. Bolton, riding his famous "red" Rudge, in 1m. 2s., so gaining a silver medal.

### Portsmouth and District M.C.

A paperchase was held on the 14th inst. Captain Tappen-den on his  $3\frac{1}{2}$  h.p. Premier and so. was the "hare," and had ten minutes' start, but was not caught, although the bounds were very close on him at the finish. The route was across Purbrook Common to Denmead, Hambledon, Catherington, to Horndean.

### Essex M.C.

A members' gala meeting was held on Brooklands Track on the 17th inst. Results:

Short Sidecar Race (about 5 $\frac{1}{2}$  miles): 1, D. S. Kapadia (3 Rex-Jap), scratch; 2, C. F. Michell (6 Bat), 8s. Speed, 40.77 m.p.h.

Short Motor Cycle Race (about 8 $\frac{1}{2}$  miles): 1, A. da Silveira (7 Indian), scratch; 2, J. H. Whitlark (6 Rex), 9s.; 3, J. A. Campbell ( $3\frac{1}{2}$  Rudge), 30s. Speed, 69.39 m.p.h.

Long Motor Cycle Race (about 13 $\frac{1}{2}$  miles): 1, J. H. Whitlark (6 Rex), 15s.; 2, J. A. Campbell ( $3\frac{1}{2}$  Rudge), 50s.; E. G. Brown ( $3\frac{1}{2}$  Triumph), 35s. Speed, 63 m.p.h.

A newly designed sidecar with sheet steel body called the Dukelet.

A.C.U. Trials. 1. Competitors passing through Porlock Village.

2. Scene on Byber's Hill. Note the loose surface.

**North London M.C.C.**

A club is being formed with the above title. Headquarters, 78, Turnpike Lane, Hornsey, N. Hon. secretary, E. E. Pickerdite, Ecclesbourne, Kelross Road, Highbury, N.

**Purley and District M.C.C.**

The results of the re-run flexibility hill-climb on the 10th inst. were as under (fast time divided into slow): 1, R. Charlesworth (6 Zenith), 4.52; 2, R. W. Gaskins (6 Rudge), 3.63; 3, P. Newbold (6 Zenith), 3.37. These subject to confirmation by the committee.

**Leeds M.C.C.**

The Leeds to London and back reliability run, held on the 20th and 21st ult., resulted as follows: 40 guineas trophy and gold medal, H. E. Haswell (3½ Bradbury); gold medals, Cockroft, Moore, Bullus, and F. K. Langton. The Billy Cup for best sidecar performance was won by Mr. and Mrs. Jenkins (3½ Triumph), both driving and qualifying for gold medals.

**Middlesbrough and District M.C.C.**

An "old crock" hill-climb was held on Saturday, the 10th inst., at Ormesby Bank. Nine riders competed, and Challenger was declared the winner. The next two events will be a paperchase and a sidecar trial.

**Westmorland M.C.C.**

A secret hill-climb was held last week on Towtop, Wither-slack. Result: 1, B. Jefferys (Bat); 2, L. S. Parker (Scott); 3, J. H. Nelson (Scott). Fastest time: L. Pierce (Corah). After the climb the competitors were kindly entertained to tea at the Derby Arms by Mr. S. Watson-Heatherburn, the donor of the challenge bowl.

**Liverpool A.C.C.**

The second open reliability trial will be held on Saturday, September 7th. The course will be a circular one in North Wales, and will pass the following places. Birkenhead, Hawarden, Bwlch Gwyn, Wrexham, Chirk, Llangollen, Llandegla, Corwen, Bala, Festiniog, Bettws-y-Coed, Llanrwst, Denbigh, Caerwys, Hoiywell, Northop, and Queen's Ferry. There will be several steep hills officially observed. The whole competition will be divided into classes. The principal award is the Reliance challenge cup, and gold, silver, and bronze medals in each class.

**The Motor Cycling Club.**

A members' hill-climb for motor cycles and cars will be held on September 7th.

CONDITIONS.—This hill-climb is intended to be a test of flexibility of the machine and clutches, or gears, if fitted, can be used. The hill will be divided into two sections. The first section to be covered at as slow a pace as possible. The road wheels of the machine must be brought to a standstill at the end of the first section, and the remaining portion of the hill must be covered at as fast a pace as possible from a standing start. The order of merit in all classes will be decided on the formula S - F, S equalling time for slow section, and F equalling time for fast section. No competitor will be allowed to assist his machine with his feet in the first section. Machines and sidecars must be standard touring types as usually sold to the public, fully equipped for the road.

CLASSES.—I., for motor cycles from 350 to 560 c.c. II., for motor cycles over 560 c.c. III., for motor cycles under 350 c.c. IV., for motor cycles with sidecar attached. V., for cars (which must be standard touring types) limited to 30 h.p. by R.A.C. rating.

One of the travelling marshalls in the A.C.U. Trials.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### The Silencer Tests.

Sir,—Reading your article on "Silencers" on August 8th, and being worried about the noise of my  $3\frac{1}{2}$  h.p. 1912 Humber, I have ordered a Dunlop Ejector silencer, 5in. diameter, 14in. long, to be placed in front of the engine, an elbow 2in. long to catch a 10in. long pipe  $\frac{1}{2}$ in. bore, which pipe will run and finish under the footboard. I expect this silencer shortly, and no doubt this will satisfy as to noise. I do not think the silencer put as I have described will disfigure the machine in any way, and if it reduces the noise by half or two-thirds I shall be very pleased. Thanks for your article.

C. DUPLESSY.

#### The Problem of the Automatic Carburetter.

Sir,—Regarding the articles on "Automatic Carburetters," allow me to state my experience with the J.A.P. automatic. I ride a 7 h.p. J.A.P. engine, and its carburetter will average 110 miles on one and a half gallons of petrol with sidecar, and I recently rode from Newcastle to London in thirteen hours. I have been using a J.A.P. a.o.i.v. engine five years and have never been stopped on the road with engine trouble nor had a valve break. I put it down to the automatic inlet valves, which allow the exhaust valves to keep comparatively cool at speed. Of course, I always keep my machine in tune, as I cannot afford to take chances on my long business journeys. I have taken your paper since its first number.

VICTOR TRAVERS.

#### Pillion Seats.

Sir,—In reply to your correspondent, "H.M.," in your issue of August 1st, I should like to express my opinion on the subject. I happen to be on a visit to the Homeland from Australia, and a few weeks ago, at the invitation of a friend, I went for a hundred miles spin as a passenger on a  $3\frac{1}{2}$  h.p. Triumph fitted with a Pantalía passenger seat and footrests. I may say I have travelled extensively by almost every form of conveyances, but never in all my experience have I had such an enjoyable run. It was simply perfection, and, in order to prove my statement, if "H.M." will communicate with me I shall be only too pleased to send the address of a person who will be prepared to give him the opportunity of testing same for himself, when he can form his own opinion of its safety and utility. I have no interest whatever in the trade. I simply read "H.M.'s" letter, and am writing, thinking perhaps that my experience will be of interest to him and motor cyclists in general.

W.R.

#### Inglorious Devon.

Sir,—I noticed in your columns various complaints of the Devonshire roads, and in no case do I think the complaints exaggerated. I myself am a constant user of the Devon roads, and I have found some of the main roads almost unrideable, having been cut up by heavy lorries. Surely some steps could be taken to limit the weight of these nuisances, as the damage which is being done will cost thousands of pounds to repair, and the district boards seem to be useless in this respect. Around Torrington and Barnstaple the roads seem to be in the worst condition, and in this district I have heard of several motorists breaking their car springs and literally having their motor cycles shaken to pieces. Another caution necessary for motor cyclists contemplating riding at night in Devon is to keep a very good look out for animals on the road, as sometimes in the early morning I have seen sheep lying asleep in the middle of the road, having strayed off neighbouring moors; these are a positive danger by night.

THE OLD SWINGROAT.

#### Waterproof Magnetos.

Sir,—We notice in your paper the report of the judges on the Scottish Six Days' Trial, and contained therein is a report on magnetos, and about which the judges state they "were particularly disappointed at the poor show given by magnetos, scarcely one of which was really rainproof in the correct sense of the word, and during the wet weather caused a great deal of difficulty to the competitors, especially in starting." We think that before judges should make such a sweeping statement they should have investigated every machine. We are of opinion that the much better plan is to put a magneto where it is not likely to be affected by rain, as it is rather a hopeless job to make a magneto waterproof in the strict sense of the word.

MOTOSACOCHE, LTD.,

O. DE LISSA, Managing Director.

Sir,—I observe with great satisfaction that the judges of the Scottish Trials in their very excellent report comment strongly on the failure of the so-called waterproof magnetos to justify its name. Speaking from a short experience of a twin-cylinder model, I say without hesitation, that it is by no means as waterproof as the older patterns. One puddle can generally be trusted to put the front cylinder of my machine out of action. When this occurs it is by no means easy to get it started again. The aluminium side plates are neat to look at, but, in my opinion, useless, as they only protect the condenser, which I have never known to be affected by wet.

JOHN KENNEDY, JUN.

#### Cattle Grazing on the Road side.

Sir,—Can nothing be done to lessen or remove the ever-recurring nuisance of cattle all over the road?

I and several friends have always been regularly hindered and inconvenienced with unexpected delays, and often difficult manoeuvring, in company with prejudiced and very indifferent treatment by the man or men in charge. The crowning point came quite recently. I was returning solo on my Premier from Pateley Bridge district to Leeds, having to be at business at the latter city at 9 a.m., and on this short run (twenty-eight miles) I was troubled no fewer than three times, in each case by an absolute block in the road.

As you know, cattle will invariably walk along in front for an almost interminable distance, however slow one crawls, rather than turn off for one to pass. And again, the noise of the engine, however "quiet," causes stampeding, so the usual alternative is—shoving, which is a caution when the scene of the encounter happens to be on a gradient of 1 in 8.

Upon the third stoppage I counted thirty cows standing all over the roadway and the grass at the sides, in charge of one man only. Getting into conversation with him, he told me they were not being driven anywhere, but were being grazed at the roadside. This licks creation, in my opinion, that a farmer should be permitted to use the public main roads for a playground for his cattle. Is it right?

I should like to say I am in no way prejudiced, as my father owns a farm, and we have several head of cattle of all kinds, so we are quite used to them, but believe in fair play to all road users if it can be managed. I should be very grateful if you would kindly help me to see what other motor cyclists think of the nuisance.

FRED J. MAISON.

[This practice, though illegal (except in a few isolated cases where the grazing rights at the roadside are owned by the Lord of the Manor) is, we fear, a very common one, and generally winked at by the authorities. We should advise our correspondent to lay the matter before the chief of police.—Ed.]

**Chain v. Belt Drive.**

Sir,—Mr. Maw's letter greatly interested me, since he links precisely as myself concerning the chain drive. Nearly every motor cycling friend tried to persuade me not to have a chain-driven machine for 1912. I am pleased to say that the chain transmission on my  $2\frac{1}{2}$  h.p. Enfield has not given me one moment's trouble in 3,000 miles, beyond getting up when new. I have seen motor cyclists telly with their belt drives who simply could not start their engine in this wet weather because their belts slipped, and others on the road with their engines racing as if they were in "free engine." The belt, to my mind, is not only a great nuisance, but highly inefficient. It would be interesting to know how long a belt would last fitted between engine and counter shaft, thus taking the place of the chain on the Enfield or Douglas. People, I think, could soon give it up in favour of the chain.

As regards comfort in riding with a chain drive, I am sure that if any rider of a belt-driven machine would try an Enfield, fitted as they are with slipping clutch on engine-raft and cush drive in rear wheel, and fitted with their excellent two-speed gear, he would hardly know that he was not riding a belt-driven machine. I personally would not dream of returning to a belt-driven machine.

I cannot say what a  $3\frac{1}{2}$  h.p. single-cylinder fitted with chain drive is like, but then I infinitely prefer a small twin  $2\frac{1}{2}$  h.p. to a single of  $3\frac{1}{2}$  h.p. It is interesting to note that the new Sunbeam motor cycle is fitted with chain drive.

K. CHARSLY.

**A Flag of Distress.**

Sir,—Referring to "Help's" letter in issue of 8th inst., some eighteen months ago, having been reluctantly compelled to request the loan of a pump (my own having given out) for a few moments from a cyclist the request was granted with such bad grace that I resolved never again to ask for it, even in so trifling a form, in the event of again being stranded. In the instance mentioned, not wishing to inconvenience anyone by stopping him, I had waited till morning up to an idly dismounted rider.

As the outcome of this experience, the idea occurred to me that, if subsequently in need of any assistance on the road, I would hoist on the offside handle-bar a red ensign with the "jack" downward, and then await the event of some good-natured rider who would see the inverted "jack" and come to my aid, while a surly one would not be hindered in his course.

However, as a result of the care and foresight bestowed on the building, my machine has never necessitated any repairs other than to adjust the belt and for three tyre repairs, and these little jobs I have, when possible, carried out in some convenient byroad, so as not to put the "gentlemen of the road" (who are sometimes found amongst car drivers as well as amongst motor cyclists) to the moral necessity of slowing to a quire if assistance be needed. Hence have so far had no occasion to put the flag idea into practice.

Sometimes, however, one merely stops to enjoy a pipe by the wayside, and at such times a green flag might be used to signify that all is well.

MELANZIE.

**Power for Sidecar Work and Petrol Consumption.**

Sir,—With reference to "Experto Crede's" letter in last week's issue, I have had the opportunity of making a comparison for six months between two 1912 standard machines, a  $3\frac{1}{2}$  h.p. Zenith and an 8 h.p. Zenith, both with Mills-Morford spring wheel sidecars. The sidecar on the 8 h.p. is somewhat heavier than that on the  $3\frac{1}{2}$  h.p.

The comparisons are interesting. (1.) The  $3\frac{1}{2}$  h.p. does 40 miles per gallon more than the 8 h.p., either solo or with sidecar (mileage per gallon with sidecar 65-70). (2.) The 8 h.p. wears out two Service belts to three of the  $3\frac{1}{2}$  h.p. (3.) The wear on back tyres is approximately the same on each. On the  $3\frac{1}{2}$  h.p. a 2½ in. Hutchinson lasted 2,700 miles. There is a 2½ in. Hutchinson on the 8 h.p. (4.) There is about ½ in. play in the main bearings of the  $3\frac{1}{2}$  h.p. (total mileage 3,700), and practically none on the 8 h.p. (total mileage 5,000). The  $3\frac{1}{2}$  h.p. must now, of course, be re-lashed.

The mileage of both machines includes an Easter tour in Wales, a summer holiday in South Devon, and various rides in and about Surrey, Hampshire, and Sussex, chiefly on the North Downs.

The  $3\frac{1}{2}$  h.p. has made a clean ascent of Reigate with driver and passenger weighing 22 stone; the 8 h.p. has made clean ascents of Whitdown and Peblecombe hills with driver and passenger of 23 stone in weight.

With regard to "Ixion's" wail about belt slip, I have found that the Service belt, running quite loose, grips in all weathers even on a very small pulley. A little Beltecum, which can easily be put on while running, stops any signs of slip.

After running a  $3\frac{1}{2}$  h.p. Zenith and sidecar for two years and a 5-6 h.p. F.N. two-speed four-cylinder for two previous years, I have come to the conclusion that, even with the Zenith gear, a 500 c.c. or under engine is not good enough for sidecar work. I do not say that the 500 c.c. is not a sidecar proposition, but for general riding, and touring more especially, an infinitely variable gear and a 700-1,000 c.c. engine is necessary.

I have no interest in the sale of the above goods; in fact, if I could afford it I should prefer a friction-driven cyclecar like the G.W.K. and a  $3\frac{1}{2}$  h.p. motor cycle for solo work; but for the man of moderate means the motor cycle and sidecar is the thing.

PHILIP S. WHITE.

**Dangerous Cross Roads.**

Sir,—Will you please permit me, through the columns of your valuable paper, to warn all motorists that use the main road between Epsom and Guildford of the many dangerous cross roads that exist between these points, as anyone, not traversing this road frequently cannot fully realise the danger that these cross roads contain.

There is one in particular that, I think, needs a more efficient danger signal than the usual red triangle, and that is where the road from Newland's Corner to Ripley crosses the main road from Epsom to Guildford at the top of West Clandon Village. There have been, to my knowledge, several accidents at this particular spot, and only recently it was the scene of a bad collision between two cars, which, I am pleased to say, was not attended with any fatal injuries, but was, I believe, the result of one person receiving a fractured jaw, to say nothing of placing both cars *hors-de-combat* for several hours. I am therefore prompted to ask you to publish this letter in the hope that it may come under the notice of one of the governing bodies, who, I feel sure, would erect a more prominent danger board in the vicinity, and thereby help to prevent a fatal accident at one of these corners. The hedges at this time of the year obstruct the view of the oncoming traffic until it is too late to avoid collision. This also applies to the cross roads at West Horsley, the scene of several spills.

H.C.

C. T. Newsome (left) and D. H. Noble (centre) who both rode  $3\frac{1}{2}$  h.p. Rovers in the A.C.U. Six Days' Trials.

### A Sidecar Clip.

A hollow body A is adapted to be more or less permanently secured to the machine by means of the clip B. Within the body A lies a split tubular sleeve C, which is coned at one end and screwed at the other. The removable portion of the sidecar comprises a plain tube D. This is slid within the sleeve C, and upon the screwed end of the sleeve is then screwed a coned nut E. It is obvious that by tightening up this nut the sleeve C is contracted to hold the tube D firmly, and at the same time is itself firmly held by the coned portions within the body A.—F. W. Mead, No. 24,612, 1911.

### An Oil-retaining Tappet.

An ingenious feature of the 1912 Triumph engines is the adjustable spring valve tappet, which is so constructed as to prevent any oil exuding from the tappet guides. The guide A is extended, and fitting over it is a sieve B, which is provided with an adjustable head C. The tappet rod D acts upon the interior of the head of the sieve B so that the impact is inside, reducing noise, a spring E being arranged between the sleeve B and a shoulder F on the rod D so as always to keep the head

### 1913 Models.

The Norton Manufacturing Co., Ltd., intend to build for next year three models only—4½, 5½, and 2½ h.p. This firm's new address is Sampson Road North, Birmingham.

### Waterproof Suits.

In a letter to the East London Rubber Co., Ltd., Great Eastern Street, E.C., Harry Long, who has just completed a ride round the coast of Great Britain, says that he gave the Kerry waterproof suit a really good testing. For the first fortnight he had to face very hard rain every day and was not wet through once.

### Trade Notes.

Mr. H. Douglas Kerr has been appointed assistant manager of the tyre sales organisation of the North British Rubber Co., Ltd., Clincher House, 169, Great Portland Street, London, W. The gross profit in connection with the business of Bradbury and Co., Ltd., Oldham, the makers of the Bradbury motor cycles, for the year ended June 30th, is £19,189.

### The Demand for Motor Cycles in Natal.

An idea of the demand for motor cycles in Natal may be gained from a picture in a recent issue of the *Durban Pictorial*. In this issue appears a photograph of a large consignment of motor cycles received by Messrs. Buttery and Hatton, Ltd., per s.s. *Briton*. All the machines were sold within nine hours.

pressed into contact with the valve stem and the rod D upon the cam rocker.—Triumph Cycle Co., Ltd., and E. L. Roberts, No. 20,214, 1911.

### A Belt Tensioning Device.

This device is adapted for use either with or without variable pulley mechanism. The usual fixed rear wheel spindle A is formed with a coarse thread B on which is eccentrically mounted a carrier C, which in turn supports the hub shell proper D upon ball bearings E. Secured to the carrier C are end plates F, G, the latter of which is formed with an extension H connected to mechanism whereby it may be operated to oscillate the carrier C about the spindle A, thus moving the actual centre of the wheel hub nearer to or farther from that of the engine pulley. When the device is used in conjunction with a variable pulley the correct belt line is maintained by means of the thread B, which moves the carrier C and wheel laterally to a slight extent as the carrier is moved to adjust the belt tension.—D. J. Thomas, No. 2,422, 1911.

### A Three-speed Gear.

The driven member A of the gear is provided with three concentric rings of bevel teeth, B, C, D. On the driving shaft are mounted three bevel pinion E, F, G, adapted to engage the bevel rings B, C, D respectively. The pinion E and F are loose upon the shaft, but may be clutched thereto by a dog clutch member H sliding upon a non-circular part of the shaft. Thus either pinion

E or F may be the driver, the other remaining free. At this time the pinion G is slid out of engagement. When both pinions E and F are out of engagement the pinion G may be moved into mesh with the bevel ring D, providing the lowest gear. Two operating levers are necessary for the control of this gear.—C. Lurie, No. 11,862, 1911.

### NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscripts, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

### A Novel Trouser Guard.

A short time ago we published a photograph of a new front wheel mudguard designed to allow a draught of air to flow through it on to the cylinders and at the same time stop all mud. This guard is manufactured by the Coventry Auto Aero Co., of Priory Street,

Coventry. We are now able to illustrate another novelty made by the same firm. It consists of a metal plate in which a series of air scoops are stamped, and is made to clip on to the exhaust and inlet pipes, thus forming an effective trouser guard without interfering with the cooling of the valve pockets.

### 30,000 Miles with One Sidecar.

Mr. Frederick Horne, Addiscombe, the owner of a Mills-Fulford sidecar, has informed the makers that he has covered over 30,000 miles on his 1908 sidecar, which has been used with six different machines, and is still running satisfactorily, but fitted with a new body.

### Catalogues Received.

The booklet of the Leicester Rubber Co., Post Office Place, Leicester, describes and illustrates the John Bull motor cycle tyres and belts.

Many motor cyclists are enthusiastic photographers, therefore they will be interested to know that the Service Co., 292, High Holborn, W.C., issue a very complete photographic list containing illustrations and particulars of all the latest and best photographic cameras on the market.

The Bosch Magneto Co., Ltd., 40-42, Newman Street, Oxford Street, W., have sent us a booklet descriptive of the ZE1 magneto, the latest waterproof type, which is fitted to most of the single-cylinder motor bicycles manufactured this year. The book is exceedingly clear, and is accompanied by illustrations and a list of spare parts. Reference is also made to the latest type of Bosch plugs. Special emphasis is laid on the fact that this magneto requires very little lubrication, and that oil which may get on the platinum points causes these to burn more rapidly.

## HILL-CLIMBING AND RACING CARBURETTORS.

The "BROOKLANDS"

MODEL, £5 COMPLETE.

WITH THE OPENING AND SHUTTING MOUTH.

Can be purchased by instalments.

### DON'T MISS A WORD OF THIS!

Although I specially cater for the ordinary tourist and every-day rider who loves **slow, quiet** pulling, an instant start, great flexibility and speed, and a tick round when in traffic or with clutch out, things he cannot get with single jet carburettors, and which he does get with the

## BINKS' TOURING CARBURETTOR

complete at **45/-**, and which does all the above with the movement of one lever only. I do not neglect the speed man, I give him the **Brooklands**, described by Mr. Conradson as "the demon," and a demon it is on **hills and the track.**

Mr. Clark on a 3½ h.p. Corah, using this Carburettor at the Warwick Hill-climb, made fastest time, actually tying in speed with an 8 h.p. overhead Jap.

**This instrument must, by reason of its construction, give more speed and power than any other.**

# THE WHITTLE BELT

WAS USED BY MR. NORMAN TAYLOR IN THE  
**WORLD'S SIX DAY'S**  
**SIDECAR**  
**RECORD.**

Mr. TAYLOR writes :

39, Charles Street, Hatton Garden, London, Aug. 6th, 1912.

Dear Sirs,—The WHITTLE BELT went through the WORLD'S SIX DAYS SIDECAR RECORD through rain, hail, and floods without trouble or slip. When one considers the terrible weather encountered during the ride it is really remarkable that the WHITTLE BELT should go the whole journey without being touched.

(Signed) NORMAN TAYLOR.

**THOS. WHITTLE & SONS, LIMITED, WARRINGTON.**

## The advantages of Chain transmission for Motor Cycles.

*Equally reliable in good or bad weather.  
 Less liable to give trouble.  
 Will outlast many belts.*

In bad weather a Chain only needs keeping clear of mud. It will then run as sweetly as on the finest day.

A Belt needs constant tightening when wet, and there is always the risk of the fastener pulling through or the belt breaking. A sudden shower does not entail a change or adjustment of chain.

A Chain though hindered by mud still gives an efficient drive, whereas a belt slips unless tightened to such an extent as to risk breakage.

Properly installed, a Chain does not require attention during a run, and only needs replacement when, after a long life, it is finally worn out.

All the leading makers of Chain-driven Motor Cycles have adopted as their Standard the

for Motor Cycles

"No roadside stoppages for replacement."

### The Guest Decompressor. PATENT.

THE little article illustrated herewith makes motor cycle starting simplicity itself, and not an athletic feat as heretofore.

EASY TO START THE ENGINE, AND GOES DEAD SLOW IF REQUIRED.  
 SIMPLE TO FIT.  
 SUITS ALL STANDARD MACHINES.  
 FITS INTO EXHAUST CAP.  
 NOTHING TO GET OUT OF ORDER.

Price **12/6** each.  
 Postage 4d.

GUEST DECOMPRESSOR CO.,  
 107, HIGH ST., WEST BROMWICH.

E.H.G.

### BAKER'S WINS ON STERNOL

(Standard Quality.)

3 MILES STANDING-START LIGHT-MOTOR TRACK RECORD.—Previous Record beaten by 23.2/5 seconds.

10 MILES FLYING START LIGHT-MOTOR TRACK

RECORD.—After 9 1/2 miles in 12 minutes (well within record) ignition trouble prevented him finishing.

3 MILES NEW BRIGHTON TRACK RECORD.—Baker's time : 3 minutes 42 3/5 seconds.

5 MILES NEW BRIGHTON TRACK RECORD.—Time : 6 minutes 10 seconds.

BAKER SAYS : "I attribute my success largely to 'Sternol.'"

Price List free.

STERNOL, 58, Royal London House, Finsbury Sq., London. E.

# CORONET SIDE CARS

## DON'T OVERLOAD.

Fit a "Coronet," the lightest and strongest, 3½ h.p. machines pull them splendidly. Why overwork your engine with a heavy sidecar?

CAN BE OBTAINED FROM ALL DEALERS.

Model 1. High-class Canoe-front Body, Cranked Axle, and other improvements, £6 6 0.

Model 4. Ornamental Cane Body, as illustration, or Close Reed Cane Body, £8 8s.

**CORONET DETACHABLE JOINTS** enable our sidecars to be detached in one minute.

We illustrate herewith the "Coronet" Quick-detachable joints, which are fitted to all our models. To detach is simply a matter of unscrewing nut about five threads. When attached, and nut screwed tight, the joint is solid and perfectly rigid, and does not rattle like some patent joints held in position by springs and pins that are liable to shake loose.

**MAGNETOS. MAGNETOS. MAGNETOS.**  
We have a large stock of the best makes from 1/6. Your old coil and acc. taken in exchange.

### 25/- ALLOWED

For your B. & B. or Amac Carburettor if fitted with B. control in exchange for a new 1912 SENSAPRAY or BINKS.

**BOOTH'S MOTORIES,**  
KEIGHLEY MILLS, BEDFORD ST. NORTH  
(off Pellon Lane), HALIFAX. Tel. 1062.

## ONCE AGAIN.

**N**OW that business is easing a little we can spare a few minutes' chat with old and new friends. We have been rushed out of the place with orders, and the constant demand for "Cordingley Bargains" has been maintained throughout the year. We have not finished all of them yet; so if it has not been your luck to obtain one, write for our list at once. It is a shrewd business man's policy to save money. Why don't you save when next you buy a Motor Cycle? Nowhere in the country do you find a select stock such as we have at the moment. It may not be quite as large in numbers as some of our competitors, but it is larger in quality. It does not interest you when someone shouts "A thousand bargains"—You only want one. The place to get it is Cordingley's. By the way, if you have got fixed up for this year, don't do anything for 1913 until you have either seen or written to us. We have secured some very special agencies, and we can "treat you right." Glance through our list, and if anything interesting, let us have your offers or enquiries. We are here to receive your call, but call now.

### Change Speed Gears.

THE variable gear question is to motor cyclists an interesting topic at any time. A few words, therefore, on this subject will be opportune at a period when next year's models are in course of preparation. The position occupied by the gear appears to be unsettled at the moment. Omitting the variable pulley gears, there are three places which the gear can occupy, viz., the rear hub, the counter-shaft, and engine-shaft: the last is almost obsolete, although not by any means mechanically wrong or to be despised. The first type has been popularised for motor cycles by reason of the high class workmanship of two leading firms who make a speciality of hub gears for pedal cycles. For solo work these gears are eminently satisfactory, albeit they must absorb an appreciable amount of power on the lower ratios. For passenger work, as at present made, they are barely strong enough, although we understand that special passenger patterns will be marketed for next year. The counter-shaft reducing gear is probably the best solution for all round passenger and solo work, particularly as it allows a combination of chain and belt (which shows signs of becoming very popular), gear and belt, or all chain transmission. Expanding or variable pulley gears are excellent for solo work, and also for passenger work where no lower ratio than 8 to 1 is required, but a much lower ratio is often essential with the most powerful engines. Again, omitting variable pulleys, three speeds have so far been confined to hub gears with the exception of some T.T. and special models which are not yet standardised.

As we observed last week, before a motor cycle can be described as a "go-anywhere" machine it must

be supplied with a really low gear suitable for all emergencies. This is where the advantage of a three-speed gear comes in, for, if the low gear of a two-speed is really an emergency gear, it is too low for the hill where, especially against a wind, the engine just begins to labour on the high gear. The selective clutch gear has an advantage in this case, for, by the change of a sprocket and chain, the low gear can be altered, without disturbing the top ratio, in a very few minutes.

For 1913 we hope to see all standard solo motor cycles provided with not less than two speeds and a friction clutch for starting from a standstill. The clutch should be so designed that it will start the full load anywhere from rest and not slip on hills. Many so-called clutches are misnamed: they do not clutch when they ought to, and some which are quite satisfactory for singles give trouble when called upon to transmit full power with a passenger on abnormal gradients. A properly designed clutch should last a season of, say, 5,000 miles without any renewals, and proper means should be provided quickly to adjust the gear without dismantling it. Most motor cycle gears and clutches should be made larger and stronger. Neatness is desirable, but when this end is too closely followed the parts are apt to be too much reduced in size and strength to enable them to stand up under occasional cases of extreme stress. We are, of course, treating the subject broadly; there are machines already made which embody the above desiderata.

Another matter which goes hand in hand with the change-speed gear question is the weatherproofing of the transmission. No matter whether belt or chain be adopted, it should be efficiently screened from the elements.

## WHAT THE SIX DAYS' TRIALS TAUGHT.

By B. H. DAVIES.

THE principal feature of the 1912 Trials is the absolute annihilation of gradients by the variable gear. The west country, notorious for its blind corners, rough surfaces, and single figure gradients, failed to furnish a single hill which could hope to stop a good rider on a modern machine with a variable gear. In every trial the entry necessarily includes a percentage of weaklings—inferior riders and inferior engines—who by reason of mistakes or temporary derangements would suffer one or more hill-failures in any trial that included a couple of single figure gradients per diem. But the 1912 machines of real excellence and known make stormed up the most notorious ascents of the West with consummate ease and mastery, so endorsing the more convincing verdict registered on the more exacting hills in the Scottish Trials. Porlock stands in a class by itself. On a dry day it is an easy climb for a good rider on a variably-g geared machine who knows what line to take at the two corners, and it has often been cleanly climbed by an amateur at the first attempt. Had the narrow side track been dry on August 17th, probably eighty of the ninety survivors would have made clean ascents with their feet on the rests. But when Porlock is wet it becomes a matter for the rider rather than for the engine, and as it was very wet last Saturday week, sixty men or more came to grief on it. It should be clearly understood that even thus the engines were not in the least blameworthy, with—at the most—a dozen exceptions. In the majority of cases the riders were responsible for the failure.

### Remarkable Pluck and Good Temper.

The officials were eager not to miss an hour of knockabout comedy, and so they insisted on putting the men to a test which may bring discredit upon the machines and the engines unless the Press is able to correct a very false impression. The men evinced remarkable pluck and good temper—only two riders allowed themselves to get fretful—and the fact that two dozen managed to slither up to just above the second bend without falling off shows as good an average of luck and skill as could be expected under such ridiculous circumstances. As a technical test it was comparatively worthless. Two or three small points of technical interest may be elicited by a closer study.

1. Seventeen solo machines got up to just above the second bend without a stoppage, though all the riders steadied with their feet. Of these only two were of more than  $3\frac{1}{2}$  h.p., the vast majority of the big variably geared twins were helpless, which shows

that a lightish machine of medium power is the handiest for trick riding.

2. The machines which were limited by factors of design to ordinary bottom gear ratios practically all failed. A bottom ratio limited to 7 or 8 to 1 is less efficient than a three-speed hub which, in conjunction with an adjustable pulley, can supply a 12 to 1 gear in emergencies. Very few of the men who got up used single figure gears.

3. Certain machines fitted with narrow handle-bars brought far back were helpless in the mire on Porlock, and were noticeably unsteady on the grease along many portions of the route. A wide bar of short reach is advisable for bad going.

4. Only one or two machines were pushed up the hill. The men who failed rode most of the hill, but either pushed or were assisted on the softest patches.

5. The passenger machines were mostly in need of more weight on the back wheel; in fact, only the G.W.K., which has its engine aft, and also had a roped back tyre, seemed quite sure of its driving grip, though the Morgan wheel, with a heavy suit case on the carrier, never completely lost its bite. So far as sidecars are concerned, designers are helpless; the sidecar passenger must lean on sharp corners, and must climb on to the carrier when the outfit tackles a greasy gradient. But cyclecar designers can easily concentrate a little extra weight further aft, and I hope they will assimilate the lesson. I fancy most passenger outfits will carry Parsons chains as a standby in the 1913 trials.

J. S. Holroyd (2½ h.p. twin Motosacoche), who won a gold medal in the Six Days' Trials. Only one hill proved too much for Holroyd's machine, and that was Porlock, but he made up for that mistake by climbing Lynton Hill and gaining the bonus.

**What the Six Days' Trials Taught.—**

In this trial the hill tests served two purposes only, apart from advertisement: they eliminated bad machines and duffer drivers, and they showed that the modern engine will stand phenomenally low gears without overheating. It rests with the A.C.U. to decide what hill-test policy it will adopt next year. Personally I should like to see a limitation of gear ratios: these abnormal gears are not obtainable on standard machines in many instances, and in some cases were adopted as a relief for lost engine tune and power. I think a  $3\frac{1}{2}$  h.p. solo machine ought to be limited to a low gear of, say,  $8\frac{1}{2}$  to 1. Had this regulation been made this year, a few engines only would have conquered all the test hills; by the latitude allowed in respect of gear ratios, inferior engines are artificially made to pose as equal to the best.

**The Secret Checks.**

The secret check system caused the men who had any considerable stoppages to suffer penalties: to

change that they are awkward to change deliberately. Probably the best gear lever position is half way along the tank on the right hand side. The valve lifter can then be operated by the left hand and gear changed with the right.

**Spring Forks.**

Several spring forks designed to embody complex parts at the fork ends gave trouble: some jammed with mud: some sustained excessive wear: and some squeaked painfully. Moving parts are best mounted high out of the mud.

The belt drive came through a week's rain much better than was anticipated. I saw very little slipping or shortening, though every morning a few men tightened their belts soon after leaving the garage. I do not think belts have altered very appreciably. The rain was almost continuous and at times heavy. Most of the men used large belts on large pulleys.

I wonder how far the belt trials are trustworthy. There are persistent rumours to the effect that the

**METHODS OF CORNERING BY THE ARIEL TEAM.**

The picture was taken on the acute bend of Blagdon Hill. It will be seen that though members of one team, all three riders adopted a different method of negotiating the corner. Sargster is inside the bend where the gradient is steepest and the surface loose. Newey has adopted a medium course, while North is on the outside—the best course to steer.

perfect this system the checks should be more numerous. Unfortunately the tedium resulting from a close schedule will gradually eliminate amateur entries.

Minor control details proved rather tiresome: the water-stiffened the carburettor controls of most machines, and put the handle-bar control of dozens of magnetos completely out of action every day. Magnetos are more weather-proof than formerly, but cannot yet be termed literally waterproof. When protected by a separate cover and some insulating caulking at the point where the cable penetrates the end-plate, they gave no trouble.

Many of the men found it awkward to change gear when hurried. It is foolish to fit a gear quadrant under the saddle on either side, and some of the controls are so safeguarded against an accidental

officials failed to safeguard one loop-hole for ingenuity.

I hope that in next year's trials a special marshal will be appointed, whose sole duty shall be to inspect officially-entered belts at frequent intervals.

**Heavy Tyres give Immunity from Punctures.**

Tyres gave noticeably little trouble. I doubt how far this is ascribable to a genuine improvement in the standard light cheap tyre fitted to machines sold in the ordinary way. In previous trials trade entrants have often relied on these light cheap tyres for competition purposes: this year the majority of the machines were fitted with specially heavy covers and punctures were rare. We cannot compel manufacturers to include heavy tyres in their catalogue price: but we can insist on heavy tyres and pay for them as an extra. For a similar reason there was little skidding.

### What the Six Days' Trials Taught.—

The West country is reputed to be second only to Derbyshire in the quality of its grease, but the heavy non-skids kept the machines remarkably steady, and I saw very little sign of skidding except in corner work, where a machine would occasionally complete a turn on a side of the road obviously not contemplated by its driver. Probably a vast portion of the wet surface traversed was not genuinely slippery: but more than once when I temporarily dismounted I found it quite difficult to keep my footing, although the machine had been travelling quite steadily.

The organisation aroused sincere admiration throughout; nothing had been overlooked, and there were no hitches. The event was a model to all secretaries.

### Suggestions for 1913.

So far as the work of the Competitions' Committee is concerned, one might humbly suggest that for next year the number of secret checks should be considerably increased, so that a fifteen minutes' stoppage on any portion of the route should inevitably be penalised. That the notion of piling up 1,000 miles by including several hundred miles of straight level highways be jettisoned in favour of a shorter total mileage limited to severe or tricky going, and that all prudential notions in the matter of hill-climbing be finally discarded.

If a town lying in a mountainous district (*e.g.*, Wales) is selected as the centre of the 1913 trials, and all discoverable hills are included, irrespective of number, gradient, corners, and surface, the evolution of the motor bicycle will be accelerated. If the weather had by chance been uniformly fine this year, the trials would have degenerated into a mere farce. It would not be a bad idea to commence the 1913 trial by a really formidable climb up a severe gradient with goodish surface, and free from trick corners, posting skilled observers every few yards. Any machine which failed on this climb from inherent feebleness should be precluded from continuing. At present inferior machines are allowed to struggle up the hills with assistance from spectators, and finally secure a minor award. The outside public are then led to infer that the machine is in itself

excellent, but that some trivial misfortune has prevented its securing a gold medal. Every experienced rider is keenly aware that engines vary widely in efficiency, and the fault of the present trials is that they do not differentiate sufficiently. They sever the sheep from the goats, no doubt; but they fail to distinguish the sheep from the hybrids.

### Cleanliness.

Turning to details, cleanliness ought to be taken into account next year, and ought to be distinguished from a paraffin brush. The mudguarding of certain machines was grossly defective, while only two or three makes of engine retain their oil; but so long as a machine which has been cleaned four times a day is lumped with a machine which has kept itself clean, cleanliness marks are useless.

The policy of awarding "bonus" marks for climbing easy hills and docking penalty marks for failing on difficult hills is obviously illogical. (I use "easy" and "difficult" in a comparative sense.) The fifteen minutes' garage allowance might well be deleted in 1913, leaving all adjustments to be made in running time. The 1912 trials have made one thing perfectly plain, *viz.*, that it is impossible to make the 1913 trials too difficult.

The rule about silence was as farcical as usual. Several machines, in spite of sealed cut-outs, made more noise than many a standard machine creates with its cut-out open. The cut-outs were sealed with very light and flexible wire, and after a day or so most of the riders discovered that by prising the wire with a lever they could open their cut-outs *ad lib.* without breaking the seals. Personally, I am no admirer of silent motor bicycles, and regard them as perils to their owners and to the public. But the A.C.U. should be consistent. If its leaders really value silence, they should at least penalise noise in their own trials. As it is, they only succeed in creating the impression that there is a wide divergence between their secret beliefs and their public professions. Why not adopt the ideals of any gentlemanly rider, leave the cut-outs unsealed, and penalise any undue noise in populous places? The only effect of their present rule is to insure noise all the time.

A Triumph rider on the 1 in 4½ section of Byber's Hill, a difficult ascent included in Thursday's secret route.

## A FOUR-CYLINDER CYCLECAR.

The Singer Company's Latest Production, with Three-speed and Reverse Gear, and Detachable Wheels.

Chassis of the new 10 h.p. Singer cyclecar, showing channel steel frame and general distribution of parts.

**T**HIS week we are able to describe and illustrate what is bound to create a great amount of interest both in the car and motor cycle world. It is an open secret that the Singer Co., Ltd., Coventry, has for months studied the question of a light four-wheeled passenger machine, and it was only a few weeks ago that we illustrated their first model—a double engined vehicle. Not finding this so comfortable and roadworthy as the Singer Company's productions must be before they are marketed, an entirely new vehicle was put in hand on more ambitious lines, and the outcome is the four-cylinder three-speed four-wheeler under discussion. It is a light car, but it comes within the cyclecar definition, weighing approximately 7 cwts., and having a cubical capacity of 1,096 c.c.

Though possessing no real departures so far as car design is concerned, the Singer cyclecar has embodied in its design the best car practice, and a cursory glance over the chassis is sufficient to prove

that no single part has been scamped for cheapness.

It is safe to say that no attempt has been made hitherto to incorporate such desirable features in a cyclecar as are to be found on the latest Singer.

Design of big end bearing showing brass insets to take up wear, oil channels, and big end bolts with flat sides to prevent movement.

### Engine Details.

Commencing with the power unit, the engine is a 10 h.p. four-cylinder, measuring 63 x 88 mm. bore and stroke. Each pair of cylinders are cast in one piece, and to save overall length the ordinary valve cap has been dispensed with. In its stead a cover plate for each pair of inlet and exhaust valves is used, tapped for the sparking plug and compression tap. The mechanically operated valves are on one side and operated by a gear-driven camshaft on which the cams are formed solid. Adjustable tappets are used with fibre insets to reduce noise, and rollers at the foot. Thermo-syphon cooling is relied upon in conjunction with a neat-looking brass-finished radiator following usual Singer design. The

The neat and compact design of 3-speed gear and back axle in one.

The inspection cover and operating levers will be noted.

Singer Four-cylinder Cyclecar.

Front view of the new Singer four-cylinder cyclecar, showing vertical tube radiator.

important question of lubrication has received special attention, and at the rear of the crank case a pump forces oil to the three main crank case bearings and also keeps the troughs into which the big ends dip plentifully supplied with oil. Any overflow passes to the rear of the base chamber through a filter and is pumped round again. The clutch is of the leather cone type. Extremely fine adjustment of the magneto is provided by means of two serrated plates, and in a few moments one can alter the timing to the mere extent of one-ninetieth of a circle if desired.

#### The Gear Box and Back Axle.

The three-speed gear box, which is operated by a gate change, is mounted upon the back axle casing, and forms a very compact unit. One can appreciate the care in design when it is mentioned that there are no less than thirteen ball bearings and one thrust bearing in the gear box and back axle alone. The gear ratios are  $4\frac{1}{8}$ ,  $6\frac{1}{2}$ , and 10 to 1, which seem to be an ideal selection.

The front axle is dropped to enable a low and racing-looking vehicle. The channel-steel frame

10 h.p. Singer four-cylinder cyclecar engine, showing valves all on one side and position of magnets.

appears amply strong for its work, while the little car should be extremely comfortable with four leaf springs at the front and five at the rear.

The rear road wheels are carried on sleeves mounted over the driving axle, thus relieving the latter of strain, whilst the brakes are of the internal expanding type.

The wheelbase is 7ft. and the track 3ft. 6in.

A beautifully upholstered two-seated body with high side doors and scuttle dash in combination with a low raked steering pillar are commendable points of the design. Altogether the Singer cyclecar is cleanly designed and has received careful thought and consideration from the smallest nut and bolt. It has 700 x 80 mm. Dunlop tyres on Sankey detachable steel wheels, including a spare wheel. A hood and screen complete the equipment of what is undoubtedly the most ambitious cyclecar we have been privileged to examine to date. Our next reference to it will relate to its performances on the road.

PUMP FEED

Base of crank chamber showing force feed oiling arrangement and troughs into which the big end bearings dip.

#### A PETROL-PARAFFIN CARBURETTER.

A new design carburetter for the purpose of utilising paraffin as a motive power for motor cycles has been introduced by C. Binks, Ltd., of Phoenix Works, Church Street, Eccles, Manchester. The fuel tank is intended to be made in two compartments, 75% of the space to carry paraffin and the remaining 25% petrol. The carburetter has two float chambers and two jets. On slightly opening the throttle the smaller of the two jets is uncovered, through which petrol is sprayed for starting and slow running purposes. A further motion of the throttle uncovers the larger or paraffin jet, and the engine begins to run on almost pure paraffin as the suction on the petrol jet is automatically decreased. On easing up again the paraffin jet is cut out and petrol is used for low speeds. This device has met with considerable success in launch work, and needs no hot air pipes or jacketing such as is usual with most paraffin carburetters.

#### A COLLISION AND THE RESULT.

The marks deducted from George Brough's scoring sheet for a loose steering head were cancelled by the A.C.U. judges after it had been explained that the looseness was entirely due to the collision which Brough sustained with a van nearing the finish of the trial. Brough could not leave Taunton last week owing to the injury he sustained to his leg, but is now home at Nottingham again.

# Occasional Comments *by "Izion"*

## Dummy Belt Rims.

Any rider afflicted with a machine possessing a separately spoked belt rim on one side of his back wheel (due to a clutch or gear hub) and a dummy belt rim supplied for braking purposes on the other side is struck with pangs when he sustains his first puncture. He attacks the valve first from one and then from the other, and makes a mental note to buy a pair of pliers with corkscrew handles at the next garage.

Then he prepares his levers, and attacks the bead, only to discover that as soon as his levers assume an angle at which the bead begins to lift they foul one or other of the belt rims. Finally he dissolves into tears by the roadside, and buys a single-gear racing machine. Will the wisecracks who design these double-rimmed machines please remember that we still use tyres, and that whatever the tyre manufacturers' advertisements may lead an innocent draughtsman to suppose, tyres still puncture, and when new, cannot be removed without leverage.

Efficient braking may be obtained with a belt rim of very small diameter, provided the leverage at the brake-shoe is good, and the material of the shoe suitable for its purpose. A wide brake rim of small diameter would be better than a narrow rim of great diameter, taking all things into consideration. I am sorry to notice that some manufacturers, principally chain drive enthusiasts, still retain external band brakes. They should have heard the free comments of a band of riders I met in Coventry after the Six Days' Trials; as soon as real work was demanded from this type of brake, it struck, and all the smearing nostrum in the world failed to restore its lost grip.

## By-products of the Variable Gear Boom.

It will be interesting to watch the by-products resulting from the variable gear boom. The really expert and fastidious driver simply slings a three-speed hub on a standard machine, and drives as easily and as prettily as ever. But some of the horrible sights and sounds which greet my offended eyes and ears as I travel about lead me to prophesy that variable gears will cause sundry modifications of existing design.

For instance, there is the clumsy driver who always runs his engine much too fast when he is sitting astraddle with the clutch out. He sins because he is afraid of stopping his engine if he throttles it down delicately. For him we must introduce the throttle which does not shut off all the gas, but allows the engine to tick softly over when the throttle is pushed back to its extreme: and that will necessitate a switch, for we cannot make the power of stopping an engine dependent on the solitary wire of the valve lifter.

Then there is the duffer who muddles his mixture whenever he changes gear; for him the automatic carburettor will become essential, and it will not greatly matter if, as some croakers allege, these carburettors are a shade less efficient than the two-lever type; for has he not a bottom gear of about 10 to 1 in reserve

for grave emergencies? Finally, will not the weight of our machines and the dimensions of our engines be steadily reduced?

In every big trial we see machines with 350 c.c. engines doing all that is necessary. Much of the continued popularity of the 500 c.c. engine is due to the fact that some people cannot afford variable gears, and those who can are still obsessed by the old tradition, now happily obsolete, that nothing under 500 c.c. is effective for touring purposes.

## Combined Near Side Lamp for Sidecars.

A correspondent remarks with some justice that a sidecar requires a red rear lamp, and that a motor cycle is not designed to carry an arsenal of lamps. He clamours for a near side lamp, with a double reflector and two burners, desiring to carry a lamp on the outside of his chair, which shall throw a white light forward and red light backward. Surely the red light ought to be on the off side of the machine, which explains why no maker has supplied his wants.

Personally, I am well content in sidecar work to employ two red reflex mirrors—one on the tail of the motor cycle carrier (off side) and the other at the back of the sidecar on the near side. If my correspondent is dissatisfied with reflex mirrors, I think he has tried an inferior brand; some of these mirrors hardly possess any real reflecting powers at all, but the original brand, and possibly one or two others, serve all rear warning needs quite efficiently, and reflect light at a considerable distance.

Mrs. Carter (2½ h.p. Levis, the latest recruit to the ranks of lady motor cyclists in Derbyshire.

# THE WEAR OF BEARINGS.

## IMPORTANCE OF EFFICIENT LUBRICATION.

**A** CORRESPONDENT has recently called attention again to this pressing problem, but the real crux of the matter he does not touch. This, to my mind, is summed up in the one word "lubrication."

Modern engines have bearings designed for very heavy loads, *e.g.*, the load on the gudgeon pin is in the neighbourhood of 3,000 lbs. per square inch, but this high bearing pressure is frequently found on large gas engines, particularly large Continental engines, and is not at all peculiar to the motor cycle engine alone. Now these large stationary engines are equipped with very thorough systems of forced lubrication, and the result is that "bearing wear" is no more trouble than on a slow speed steam engine with comparatively low bearing pressures of about 200 lbs. per square inch. Consider also the motor car engine, this is vastly better in respect to bearing wear than the average motor cycle engine, and here again the reason is found in a better system of lubrication, although much room for improvement still exists.

Forced lubrication is slowly coming to the front, and this year has seen several new engines employing it in one form or another, *e.g.*, the Veloce or W.D.

The advantages of forced lubrication were very apparent when I recently saw one of the first-mentioned engines dismantled; although the engine had done much work, and should, if of ordinary design, have been exhibiting signs of bearing wear, the marks of the tools were still plainly visible, and the bearings were not properly worn in. Incidentally, carbon deposit was also strangely absent, and the cool running of the engine had to be experienced to be believed.

Here, then, is the problem already solved, forced lubrication under a pressure of 10 lbs. per square inch is employed, and bearing wear vanishes to a negligible

amount, bringing also other advantages, with which however, we are not at present concerned.

Another method, the one advocated by the correspondent previously mentioned, is the lightening of the load to suit the bearing. This, to me, savours of bad practice—we are starting designing from the wrong end, since we should design the bearing to suit the load, not the load to suit the bearing. However, I agree for various reasons that light reciprocating parts are desirable.

Steel pistons are best made by the welding process, and I have seen many fine examples of pistons so constructed, an ordinary 85 mm. piston weighing about 14 ozs. with the gudgeon pin and rings. This process is much cheaper than machining from the solid, and good results are assured since the distortion of pistons so built has so far not given trouble, although many hundreds are in use. The welded steel connecting rods recently brought out ought also to be very satisfactory, but as far as Duralumin is concerned, I am not very hopeful. I was recently present at a test of a beam built of this material and it certainly is very strong and light, but the beam failed at a much lower stress than for which it was designed, due probably to fatigue. I am not allowed to say more as the tests were being conducted on behalf of the Admiralty.

Aluminium, however, and its alloys seem to suffer badly from internal decay or "fatigue," as it is commonly called, and I am under the impression that a connecting rod of Duralumin would not give satisfaction for long, since the reversals of stress which take place in a connecting rod would very soon produce "fatigue." In conclusion, let us lighten reciprocating parts as much as possible and this will certainly improve matters, but better still, let us lubricate our engines, not merely fling oil on them when we happen to think of it.

A.G.D.C.

## MOTOR CYCLES FOR BUSINESS PURPOSES.

**I**N a recent issue we referred to the important test case decided at Barnsley respecting motor cycle taxation exemptions. A Mr. T. W. Taylor, of Skelmanthorpe, who for several years rode a motor cycle without paying an inland revenue licence, claimed exemption on the grounds that he used his machine solely for the purpose of business. He had his name and address painted on the machine in letters of the regulation size, and the inland revenue officials allowed the exemption. When the local taxation authorities took over the collection of the taxes they immediately claimed payment. The matter was laid before the Auto Cycle Union, who decided to defend, but the case was decided against Mr. Taylor, the bench stating that the defendant's motor cycle had not been constructed and adapted solely for the purpose of business. He was fined 10s. and costs. The Auto Cycle Union considered the question of appealing against this decision, but, acting upon the advice of the local solicitor, Mr. S. Neuman, of Bradford, who says that there is no probability of success if an appeal were lodged, the Auto Cycle Union has decided that they cannot go any further in

the matter. It seems to our mind a very great pity that the decision of a local bench of magistrates should be regarded as final in an important case of this kind.

THE PASSENGER TRIAL IN YORKSHIRE.  
Group of competitors at the Stamford Bridge check on the first day's run.

## A New Automatic Carburetter.

**A** NOVEL automatic carburetter on the lines of those generally used on American motor cycles is shortly to be produced by Holley Bros. Co., 46, Northumberland Road, Coventry. The operation of the device can best be understood by reference to the sketches reproduced herewith.

Sectional view of Holley Carburetter.

The float chamber surrounds the jet, petrol being fed in from the top, and the flow is controlled by a hinged cork float which actuates the needle A. The petrol passes through a hole (not shown) in the main casting B, and thence through the holes H to the jet. This jet is adjustable by the needle I, and acts as a control on the flow of petrol only, as when the engine is stopped or running very slowly the petrol level is considerably higher. For starting purposes almost

adjusted so that the engine will just revolve slowly when the throttle is quite shut. As soon as the throttle barrel is raised air begins to pass through the intake port (shown in sketch), the size of which may be adjusted by a small lever. It then passes downwards round the outside of the choke tube L, and then through the choke tube to the engine, having picked up a supply of petrol at the jet. When the engine picks up speed the level of the petrol in the well rapidly decreases until, at high speeds, it is drawn direct from the jet. When the level in G gets below the bottom of the vaporising tube M, air is free to pass downwards through the small holes N, and thus mingling with the petrol prevents too strong a mixture at high engine revolutions. On slowing down the level again rises in the well, thus giving a strong mixture for slow pulling. A small drain pipe C is formed in the main casting to remove any surplus petrol, and a tap is fitted by means of which petrol or impurities may be drained from the float chamber. The throttle is of the barrel type, controlled by a Bowden wire. We hope

The complete Carburetter.

pure petrol is sucked from the well G through the pipe J and through a small adjustable orifice on the engine side of the throttle. This orifice should be

adjusted so that the engine will just revolve slowly when the throttle is quite shut. As soon as the throttle barrel is raised air begins to pass through the intake port (shown in sketch), the size of which may be adjusted by a small lever. It then passes downwards round the outside of the choke tube L, and then through the choke tube to the engine, having picked up a supply of petrol at the jet. When the engine picks up speed the level of the petrol in the well rapidly decreases until, at high speeds, it is drawn direct from the jet. When the level in G gets below the bottom of the vaporising tube M, air is free to pass downwards through the small holes N, and thus mingling with the petrol prevents too strong a mixture at high engine revolutions. On slowing down the level again rises in the well, thus giving a strong mixture for slow pulling. A small drain pipe C is formed in the main casting to remove any surplus petrol, and a tap is fitted by means of which petrol or impurities may be drained from the float chamber. The throttle is of the barrel type, controlled by a Bowden wire. We hope shortly to try the device on the road.

## THE SEDGER FOUR-SPEED GEAR.

**T**HE arrangement consists essentially of a sun wheel O, which is representative of a pinion fixed to the engine-shaft, this driving the internally-toothed annulus H by means of gear trains, of which there are four, each coming into action in turn as required, according to the relative position of the gear box K with reference to the sun wheel O.

The gear trains referred to above consist of a train of wheels mounted on bearings rigidly fixed to the box K, the method by which any particular train of gears is brought into gear with the sun wheel O being as follows:

The box K is carried on a boss A projecting from a specially designed carriage C, which is rigidly fixed to the crank case of the engine, this boss being eccentrically arranged with reference to the engine driving-shaft which carries the sun wheel O.

This eccentric boss A forms a bearing about which the whole system of gear trains can be revolved, the amount of eccentricity being adjusted so as to bring about during a complete revolution the required number of gear changes.

It will thus be seen that as the box K is rotated concentrically about the boss A different gear trains will be brought into operation, the box K being locked in any required position corresponding to a particular gear ratio.

The actual operation of changing gear is performed in the following manner: The cone clutch M connecting up the engine-shaft to the driving pinion O is first released, the box K is then rotated about the boss A by means of a lever until the particular gear ratio is obtained, the clutch is then closed and the drive thereby transmitted to the belt

rim H, which drives direct on to the pulley of the back wheel.

The gear is designed to obtain four ratios—10 to 1, 8 to 1, 6 to 1, and 4 to 1 (when the belt rim is twice the diameter of the pulley)—with a gear box weighing only about 15 lbs. and having an external diameter of 8 in.; also, since the box moves concentrically on the boss A, the belt tension will remain constant for all gears, the extra weight being located near the centre of gravity.

Another slightly different design of this gear provides side meshing of gears and stationary position of gears not in use.

## A WEEK IN WATERPROOFS.

### AN ACCOUNT OF THE SIX DAYS' TRIALS FROM A RIDER'S POINT OF VIEW.

**I** MAKE a rule of riding to the venue of a trial, as nothing else tells one so certainly that all the workshop adjustments are top hole; a long journey would only mean extra carbon deposits towards the end of the thousand miles, but forty or fifty miles of hilly road provide a final test of the tuning. My own adjustments included very slow timing of the magneto, lowering of the compression ratio, a carburettor setting which gave a good head of gas at low engine speeds, etc., etc., and the last road test showed that the machine could do 55 m.p.h. on the flat (which meant high r.p.m. on the test hills), and that it could climb single figure gradients on bottom gear as slowly as I could balance or steer. Incidentally my gear ratios were 4.5, 6.3, and 9, which took me up all the test hills with power in reserve: I could have got a low gear of 13 to 1 by adjusting the engine pulley down to its minimum diameter, but I never touched either the pulley or the belt throughout the week, and in the journey home from Taunton the machine did 57 m.p.h., i.e., was 2 m.p.h. faster after the trial than it was before it.

Reaching Taunton on the Saturday, we found the city absolutely motor mad: even the telegraph boys were practising "leaning out" round all the corners. It was a great comfort to find a capacious garage with a clean floor: in some previous trials we have had to store our machines in dirty stables, and have been so crowded that the morning adjustments were most uncomfortable, and in case of rain we have often been wet before the start. This year Mr. Loughborough's starting arrangements were so admirably spaced and timed that there were seldom more than twenty riders at work simultaneously in the garage after breakfast, and even if we had been packed into a quarter of the actual space provided there would have been neither crowding nor confusion. In fact, the entire organisation from A to Z was perfectly magnificent, and the new secretary's *début* was a stupendous triumph.

#### Monday. Over Dartmoor in the Wet.

Monday's run was to have been a picnic, but the clerk of the weather intervened: and we were very damp Dicks indeed when we reached Taunton at night. There were no gradients capable of teasing a three-speeder, and the surface on the open roads was too hard and gritty to be really slippery. The terrors of West Country grease have been exaggerated: I was using covers with very shallow longitudinal ribs, which wore right off in the 1,000 miles, and I only felt a slip twice, in each case on a tramline. Our main discomforts on Monday were negotiating slimy streets, especially from Torquay to Paignton, and facing the rain across Dartmoor, which lashed our faces like volleys of duck shot, thanks to the raging gale at its

back. Many of the alleged "storm-proof" garments leaked like sieves, and the oilskin merchants did a roaring trade. I was one of the very few men who kept dry, and I recommend my outfit to genuine storm-pluggers.

#### A Rainproof Outfit.

It consists of a pair of separate oilskin leggings, which stop short of the waist; they are more genuinely waterproof than the best paramatta, and their low cut eliminates ventilation troubles. My feet are protected by storm goloshes, which are indistinguishable from patent leather boots in appearance, and are instantaneously cleanable (waders look hideous, cause perspiration, and are awkward to get on and off). After trying expensive jackets of every known material, and finding them all porous in prolonged rain, irrespective of their cost, I have adopted a good oilskin coat, of the light non-sticky type. Oilskin specialists stock the higher-priced coats in grey, fawn, green, and brown, so that one is not limited to the hideous blacks and yellows. I am most proud of my head gear; a cap lets runnels of water flow freely down one's neck; the tail of a sou'-wester "lifts" in the wind like the planes of a Blériot, so I use a close-fitting Flixson-cloth helmet which comes down on to the shoulders and round under the chin, its only orifice being an oval face-hole. Not a drop of water penetrated my armour all week, and its total cost was 33s. complete.

The "secret check" system is more gratifying to the public than to the competitors. It is very tedious to ride 1,000 miles with one eye on a watch and the other on the odometer, but there is no simpler method of insuring that trouble shall incur a penalty. In all previous trials I was normally thirty minutes ahead of schedule time, and could face an awkward repair without risking the loss of a single mark. In this trial I was normally dead on time, and it was always questionable whether even a simple puncture might not result in a penalty. It depended on how close ahead the next secret check might be. "Blinding" has been automatically eliminated, except in those rare cases when a man is fighting to avoid disqualification by finishing a day's run not more than two hours late.

#### Tuesday. The Bad Roads of North Devon.

Tuesday was a formidable day. We had our first taste of the badly kept roads of North Devon, and sampled its gradients. Several men had to dismount and gallop alongside out of Parracombe village—the hill took us by surprise, and the corner at the foot was greasy. I was busy wondering whether I had better try a lower gear than 9 for Beggar's Roost. But my engine felt very full of ginger that morning.

# Avon Motor Cycle Tyres.

Suitable for all climates.

Suitable for  
tricar or 5-6 h.p.

## Tricar.

Made in 24", 26",  
and 28".  
2 1/4" - 40/- each.  
2 1/2" - 42/6 "

Tube, No. 2 Qual.  
1 1/4" 9/6; 2 1/2" 10/3.

Tube Lr 36.  
2 1/4" 8/3; 2 1/2" 9/-.

## Stonehenge.

Made in 24", 26",  
and 28".  
2" - 25/- each.  
2 1/4" - 26/9 "  
2 1/2" - 28/6 "

A most popular  
cover at a popular  
price.

Extra strong casing.

## Lightweight A.

Made in 24", 26",  
and 28".  
2" - 17/9 each.  
2 1/4" - 19/- "  
2 1/2" - 20/3 "

As a cheap cover  
this cannot be  
beaten.

## Combination.

Made in 24", 26",  
and 28".  
2" - 42/3 each.  
2 1/4" - 44/- "  
2 1/2" - 45/9 "

Steel and rubber  
studs, an ideal all-  
weather non-skid.

## AVON MOTOR CYCLE TUBES

fitted with motor cycle valves.

No. 2 Quality P.A. Quality  
(Red or Grey) (Red or Grey)  
24", 26", and 28".

**A Week in Waterproofs.—**

and when the hill hove in sight I could see there were no obstructive corners. I had read Spencer's invaluable article in *The Motor Cycle* of June 27th, and knew I had to hug the wrong side all the way up. So I tackled it on the run with a hot engine geared 9 to 1, and yelled up, taking only one precaution, which I invariably observed on all test hills, viz., not to follow closely on the heels of another rider who might stick and baulk me. It was shocking to hear of so many failures, for the grade is only fractionally worse than Sutton Bank (1 in 3.33 as against 1 in 3.96). I think some of them made driving blunders due to brief acquaintance with their machines. I know of two men who fitted three-speed hubs specially for the trials, and when they slammed the lever across to bottom gear notch for the Roost, the hub remained on middle gear, as often happens if the gears are short of oil or if the delicate control is a shade out of adjustment. So they promptly conked out in blissful ignorance of the fact that a touch at the valve lifter would have snicked the gear home. The one silly mistake made by the judges was to make Beggars Roost and Lynmouth hills "bonus" climbs (twenty-five marks for success and no penalty for failure) and to make Porlock a fifty mark penalty climb, for Porlock—in the condition we struck it—was twenty times more arduous than either of the bonus climbs.

**An Inspection of Porlock and Lynton.**

Running into Lynmouth for lunch, we all walked off to survey Lynton Hill, which had to be faced on Saturday, and we found Spencer's advice quite correct. It is an easy climb when you know it, but a stranger would probably fail on his first attempt, even if he used an 8 h.p. engine on a 10 to 1 gear. Countisbury came immediately after lunch, and was listed as a "slow climb," but we were at liberty to use our bottom gears and slip our clutches; the rumour about taking it on top gear was nonsense. It is a simple climb for a single speeder when it is dry, 150 yards of 1 in 6 round the easy curve at the bottom is its only difficulty, and except in wet weather there is always a strip of good going 18 in. wide on the wrong side. Not knowing the hill I thought it wise to leave the crawling prize to others, and popped up comfortably at 10 m.p.h., changing on to middle gear above the Tors Hotel garage. I took special note of Porlock Hill as we dropped down it, for it was another new hill, and we had to tackle it with carbonised engines on Saturday morning. Some of the astute trade riders turned round at the bottom and made trial ascents, as there were no officials about, but their cunning did not profit them, for Porlock on Tuesday dry and Porlock on Saturday wet were as different as cheese and rice pudding. After this we had a soft run home.

**Wednesday. An Easy Run in Gloucestershire.**

Wednesday was a tolerably easy day in spite of much heavy rain. The hill-climbs, Cothelstone, Cheddar, Wootton, Scot's Quarry, and Birdlip, brought very few men off middle gear, and burdened only a handful of weaklings with penalties. In fact only a combination of bad corner, bad gradient, and bad surface can tease a modern three-speeder, and as a consequence the hill-climbing element of a trial has

lost most of its sporting interest. It was very foolish of the organisers to "observe." The yard at the top of Birdlip looked like an Olympia Show—I have never seen so many motor cyclist spectators gathered together. One brought a very curious sidecar which, as somebody said, was "trying to look like a vegetable marrow."

**Thursday. The Secret Route.**

In Taunton everybody was talking with bated breath of Thursday's secret route; to hear the croakers one would fancy we should be set to climb trees and ford rivers. Some of the trade men had previously explored the side tracks in the neighbourhood, and they assured us there was no cause for alarm. The climbing shrank to a very few patches of single figure gradients in narrow lanes, and the water splashes dwindled to a couple of tiny trickles across the road. It was an interesting day, nevertheless, for the hedges and corners kept us permanently on the *qui vive*—one never knew what was coming. I smelt a rat whenever I momentarily found myself on a good road with a range of hills anywhere handy, knowing it was heavy odds on a double V corner inside a mile, followed by a greasy lane ascending tortuously. However, the hills were all "potty" (except Byber's) and I took them easily on middle gear.

**A Surprise Hill.**

Byber's was most ingeniously planned. Our watchfulness had been lulled by twelve miles of decent highway, the route card said "Taunton 85 miles," the speedometer trip said "75 miles," and the milestone said "Taunton 10." The obvious deduction was that we were to amble gently straight down the main road into lunch, with no more twists or thrills.

Four of us swung round an easy curve at 30 m.p.h. when suddenly an arrow made us turn V-wise round a most awkward corner. Great was the squeaking of brakes and crackling of oaths. The presence of an official concealed inside the corner showed that a dismount spelt a penalty, and simultaneously we sighted a huge crowd almost vertically overhead massed in that arc formation which shrieks the information "1 in 5 hairpin" to an experienced competition man. Somehow or other the clump of us bundled up the corkscrew to discover some real gradient on a stony surface that was unsuccessfully trying to be genuinely Scotch. I clambered up after an awkward wrestle with my gear lever. This narrow squeak for 50 marks taught me a lesson, and ever afterwards I changed down early when a bad hill was anticipated. The afternoon's run was free from the awful grease which had bothered us all morning, and simply bristled with little hills, though none of them could be

A 7 h.p. J.A.P. engine with several novel and original devices to gain extra speed which F. H. Arnott is tuning up for an attempt to break the Brooklands short distance records.

### A Week in Waterproofs.—

termed difficult. I was surprised more use was not made of the Dartmoor and North Devon by-roads, which are distinctly more severe than any in the immediate neighbourhood of Taunton.

### Friday. Less Rain and Easy Roads.

Friday was pure baths—150 miles of undulating main road, with only one footling little slow climb to spice it. It gave us a rest in preparation for the terrors of Lynton and Porlock on Saturday, and served to show off our machines to the public in yet another district. Moreover, there was not as much rain as usual. In the evening we all got very nervous. A pressman who was spending the night in Porlock village telephoned that rain had fallen steadily all day, and that the famous hill was in a shocking condition. Some sixty amateur motor cyclists had attempted it during the day, and only two had got up, for a deep sea of red mud extended practically across the road at the second corner, and covered it from hedge to hedge higher up. Lynton Hill would, of course, be equally difficult, and we had to rise at 4 a.m. and face these perils on empty stomachs, for who can eat heartily at sunrise?

### Saturday. The Grand Finale.

Some of the men put their gears right down to 12 and 13 to 1, others contemptuously kept their pulleys up. I decided on a 9 to 1 gear out of policy, not conceit, for the eight miles non-stop prior to the hill would not be good for the engine on a  $6\frac{1}{2}$  gear. Down the short hill into Porlock most people cooled their engines by coasting on low gear, so getting as much as 500 idle revolutions, and tackling the climb with chilled cylinders. A little jockeying for positions ensued—nobody wanted to ascend behind a clump and get baulked—and then up we went. On the initial stages, which are easy and have a comparatively good surface, I kept my throttle nearly shut. When the first bend loomed up it was churned into a quagmire of seething red mud, varying from 4in. to 12in. deep, and I took it wide, where in happier days the smooth hard strip is wont to be found. Whether there was a better track on the other side I don't know.

### I Slither up Porlock.

Both wheels were sliding violently in all directions, and the back wheel would occasionally sink into a deep patch and spin uselessly for a moment until the throttle was shut, when it would bite suddenly and tempt the engine to conk out unless the carburetter levers were hastily reset. By this time all hope of a technically "clean ascent" with feet on the rests was gone. Our feet were all trailing in the claret-coloured mire, steadying our machines now on this side, now on that, for the side of the road was banked gutterwards, and the centre was so ploughed up as to be unrideable. The sides of the hill were littered with machines that had conked out, and were going up

in penny numbers. It was a grotesque burlesque of a hill-climb, for nobody was short of engine power, but nobody could steer or balance properly. Somehow or other I slithered up to the second bend, where the road vanished suddenly to the left, and a huge crowd of spectators were consumed with laughter. Cutting across the crook of the bend I espied on the left a steep heather bank, on the right an indescribably deep ocean of red mire, and in between them a narrow V-section rut full of red grease. By a gorgeous fluke I got my front wheel heading for the rut, and slid up it, grade apparently 1 in 4.

### And Just Miss a Boulder.

Suddenly in the centre of the rut there loomed up a beetle-toothed boulder a foot high. The front wheel missed it by an inch, and giving it a frightful kick with my left foot I just yawed the machine wide of it and scraped up. Further up, in company with

A group of motor cyclists attached to the South Midland Royal Engineers, at the camp on Salisbury Plain.

many others, I turned completely round in a deep swamp of red mud where the road was practically level, and tried to re-descend the hill. Everybody who reached the check at the corner of the toll-road up to time was unfeignedly glad. I was relieved to hear I had not been abnormally clumsy, for everybody had to trail feet, while the big twins proved less steerable than the singles.

Dropping swiftly into Lynmouth through the white fog banks and driving rain, we found a far more practicable climb awaiting us. Right up this hill there is a well-beaten track 18in. wide on the wrong side, and though very greasy it was not deep in mud or unduly soft. My back wheel never spun on it, but as the tread was practically smooth, I was unhappy about side swerves, especially with one's right hand knuckles practically scraping the rock wall all the way up.

We were all unfeignedly glad when this wet and weary week came to an end. Porlock in the grease will long remain in our memories as the worst single test to which motor cycles have ever been subjected, but otherwise—in spite of the rain—the west country roads are, after all, only child's play compared to the Scottish Trials.

## HILL CLIMBING.

"I feel I must express my surprise at the hill-climbing qualities of the fixed engine B.S.A. Motor Cycle you supplied me with. I have same permanently attached to sidecar. I had occasion to climb Maldon Hill twice recently, when it took same in grand style with wife in sidecar on both occasions. This is considered the worst hill in Essex, and was taken after a 16 mile run with warm engine. It also appears a very cool running engine, as when riding I can always comfortably bear my hand down fins on cylinder; it never seems to heat beyond a certain temperature. The balance is perfect and it is easy starting, and altogether I am more than satisfied."

H. G. DIGBY, West Mersea, Essex.

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

### Waterproof Glue.

Sir,—Your correspondent "Mudplugger's" tip for a waterproofing mixture is splendid, being effectual and cheap. I wonder if he or any reader could give us ingredients for making a waterproof glue.

ANOTHER MUDPLUGGER.

### Care of Belt Fasteners.

Sir,—A tip which I have found very useful, and which may be of service to your readers, is to smear the hook and rollers of the belt fastener thickly with vaseline. The average motor cyclist forgets all about this essential accessory until, generally in the pouring rain, the fastener pulls through. If the fastener is not kept well oiled, rust sets in and makes short work of the connection. Ordinary oil soon works off, but a lump of vaseline will both ease the hook and the roller and will prevent rust. It will double or even treble the life of a belt fastener.

F. G. PEARSON.

### The Behaviour of certain Motor Cyclists.

Sir,—I was sorry to read again in your columns of the bad-mannered behaviour of certain motor cyclists. The stories are very similar to what we read respecting the rowdiness (to use a very mild term) which took place during the Scottish Trials. If this sort of thing is allowed to continue, all motor cyclists will in time become tarred with the same brush, and most undeservedly. I should like to suggest that the A.C.U. take the matter up, publish the names of the offenders, and suspend them for a twelvemonth,

The Rover machines in the Six Days' Trial ran most consistently. D. H. Noble (shown above in the pouring rain at Two Bridges) climbed all hills on the route and gained 25 marks bonus for an ascent of Lynton Hill, Lynmouth.

or longer if necessary. *Fiat justitia ruat cælum.* Surely it is possible to be "funny without being vulgar," as Albert Chevalier used to sing

ACTON HILL

### Pillion Seats.

Sir,—In your issue of August 15th appears a letter under the heading of "Pillion Seats," signed by "G.W."

I would like first to say that I quite agree with the writer as to the dangerous practice of carrying a passenger on a motor cycle in that way.

My object in asking you to publish this letter is because the rider mentioned or referred to is a personal friend and clubmate of mine, and as my initials are the same it might lead one to suppose that the letter came from me. You, sir, will, of course, know that this is not the case. So far as I am aware, I do not know the writer.

G. WEST.

Sir,—I have been using a pillion seat (Leamington chair) for about twelve months and have had various upsets along with a great deal of pleasure in using it. My first upset was owing to making a wrong turn and trying to correct myself too rapidly. The others have been due to grease, i.e., muddy roads. On these occasions, after much consideration of the reason or the main cause, I have come to the conclusion that the fall was due to a sudden application of the brake on the front wheel.

Regarding the automatic carburetter, may I say that the quest is more or less doomed to failure. You may get simplicity, but you will get a hotter engine; you may even save petrol, but you will never get the power that a twin carburetter as the B. and B. will give. The automatic inlet valve has gone out because it was not as unerring as the m.o.i.v., and so will the automatic carburetter.

HAMPSFIELD.

### The Braking Effect of Compression.

Sir,—I should be interested to know, in the columns of your paper, by virtue of what one gets any braking effect from running against the compression. Practically, of course, one does, but theoretically it would seem that one ought not to. When the engine is hot and the gas is turned off while running it sucks in cold air alone, which will get hotter and hotter during the cycle, till on the power stroke it should be doing more work on the piston in expanding hot than the piston has done on it in compressing it cold.

If the process were entirely adiabatic, which it very nearly is, and the cylinder walls were at the same temperature as the air in inlet, the work done on the air would be exactly the same as the work got out of it again. But even when the process is not truly adiabatic and the cylinder walls are hot, it is doubtful whether the air ever reaches a higher temperature on compression than that of the cylinder walls, so that any transference of heat would be from the walls to the air, and not from the air to the walls. Part of this heat must necessarily appear in the form of extra work on the power stroke. Unless, therefore, the fact that the exhaust opens before the bottom of the power stroke is sufficient to dissipate that extra work, as well as some of that which would be got back from the air from ordinary adiabatic expansion, it is not clear wherein the braking effect lies. I have neglected the resistance due to friction in the argument, as this is present even with the exhaust open, though not to quite the same extent.

I would be very interested to hear an opinion expressed on this problem.

R. WEST.

### Power for Sidecar Work.

Sir,—Undoubtedly to many owners, simplicity is a *sine qua non*, and this is why they prefer overloading a  $3\frac{1}{2}$  h.p. to buying the more complicated machine. But the  $3\frac{1}{2}$  h.p. is not designed for sidecar work, generally speaking, and the sight of one of these gallant engines dragging the sort of "hotel" that constitutes many modern sidecars, ought to receive the consideration of the R.S.P.C.A. The machines will do it I know, but is it good for them, will they last as long, is it not in the end false economy? I have seen donkeys dragging an entire family to Epsom, but my sympathy was with the donkey. I would therefore call the attention of "simplicity seekers" to a combination which is not overloaded when pulling a sidecar and possesses the advantages of a single-cylinder. I refer to the 600 e.c. singles. The way in which these engines will pick up from a traffic stop or on a hill is nothing short of marvellous. Long grinds on low gear are unknown, and almost any main road hill can be surmounted on a  $4\frac{3}{4}$  to 1 gear, my usual touring gear being  $4\frac{1}{2}$  to 1. This, I believe, is impossible on a  $3\frac{1}{2}$  h.p. unless the owner lives in a very flat district. Recently, having mistaid my belt punch, I was unable to lower my gear from the abnormally high ratio of  $4\frac{1}{2}$  to 1, but managed to go from just outside Douglas to Ramsey on top. A passenger and luggage occupied the sidecar which, unloaded, is not light. These few remarks show that for an extra 50s. one may be possessed of a combination that will have ample power coupled with the simplicity of the single-cylinder.

OLDEST.

A new model single-cylinder Moto-Reve with engine placed vertically. This is the latest production of the Geneva factory.

### Silver Plate v. Nickel.

Sir,—Having had an extensive experience with cycles, typewriters, and other nickel-plated articles, I have been the recipient of many bitter complaints concerning the unsatisfactory state such things get into in a surprisingly short time. After close observation I have arrived at the following conclusions:

- (1.) That nickel, no matter how good the quality, is utterly unsuitable to a humid climate like that of Great Britain.
- (2.) That nickel perishes through the corrosive action of damp, and never gets the ghost of a chance to wear out.
- (3.) There exists no satisfactory method of adequately protecting it; the usual method of smothering it with vaseline and other grease being most objectionable.
- (4.) That it is high time some other metallic finish took the place of the nickel process.

I suggest electro-silver. I know the machines can be enamelled (after the fashion of an "all weather" mount), but this is not a satisfactory solution of the problem. Bright metal is attractive to the eye, and will always be preferred to a dull finish by most people; consequently plating of some sort must be adopted. The idea of silver may be startling at the first blush, but I would like to see the subject discussed in

your columns. I am convinced that even a cheap third grade silver plate would give far better results than first grade nickel, and I should imagine the cost of the former process would be very little more than that of the latter. The silver has a much longer life. It is not destroyed by damp, as the nickel is, the slight oxidation that forms on it when it has been neglected for a while being easily cleaned off with a soft chamois leather and a little plate-powder, leaving the plated part as good as new. On the other hand, no amount of polishing can restore the nickel when the fatal "frosty" appearance sets in; it is gone for ever. There is also no effort required to restore silver to its virgin bloom, when it has turned slightly "blue"; while cleaning corroded nickel is a "terror." Cannot some manufacturer muster up enough courage to make the experiment? I am sure he will be well repaid. Scores of men would rather pay a little more, and have a plating that would last two or three years, than put up with the present unsatisfactory nickel finish, that perishes in as many months, if it be neglected ever so little.

ANTI-NICKEL.

### Petrol Consumption.

Sir,—I have noted correspondence in your columns lately regarding petrol consumption, and see that very few get more than 90-95 m.p.g. It seems strange—perhaps it is "in the air"—as a  $3\frac{1}{2}$  h.p. Humber with two speeds that I had averaged 115 m.p.g., and my present machine (1911 5 h.p. Indian) regularly does 120 m.p.g. This seems a long distance, but I assure you it is quite accurate. The district round here is very hilly also. Of course, the machine is kept in decent trim, and engine cleaned out about every 300 miles. I presume the majority of people do not worry about this more than once every 800 miles or so. I find it pays to clean often, and have the pitting (if any) on the valves turned off in a lathe. A few revolutions with grinding paste then does the trick without appreciable wear on the seating.

The few motor cyclists around here are extremely keen. Some weeks ago a Salvation Army man, soliciting alms, rolled up on a  $3\frac{1}{2}$  h.p. New Hudson—a gift to the Army from one of its patrons. We got into conversation and he told us he does all his travelling round the country on it, rarely taking a train. He was so keen he nearly forgot to ask for a subscription!

One grumble before I close, and as it is a serious matter for those living on bad roads, and is an old complaint, it is strange so little notice is taken by manufacturers shipping machines over-

sea, why are not machines fitted with extra strong rims and spokes? Even the front wheel, supported by the spring forks, loses its shape, and the back wheel is a continual source of annoyance. My own machine was fitted with special rims and spokes and  $2\frac{1}{2}$  in. tyres by the Hendee Co., London, without my requesting them to do so, and they do not show the wear anything like some of the machines I see that have not been subjected to the banging about mine gets, nor half the mileage.

By the way, I seem to remember a threat last year that, before long, Mr. Wells was to make our  $3\frac{1}{2}$  h.p. singles eat dirt, and a request that you make a note of it. That seems to have been the end of the furrow. What a pity!

Congratulations to the Old Country on regaining the T.T. May she long retain it. I ride a machine of foreign manufacture, but like to see British machines do themselves justice.

BWANA M'DOGO.

Selukwe.

### A Few Lines about New Zealand.

Sir,—As I derive so much pleasure from your paper, I cannot refrain from sending you a few lines about New Zealand. I drive one of the few sidecars here, and the only one in this district, about half-way between Wellington

and Napier. New Zealand, though a hilly country, is not, at least in the southern half of the North Island, a country of very steep hills, but nearly all the hills are fairly steep. Grades worse than 1 in 9 are rare, most hills are between 1 in 12 and 1 in 10. In fact, the road has sometimes been sacrificed to the grade. The hill roads are always very narrow and often very rough. There will be just room for light traps to pass, and often on bad hills not that. I have never seen in England roads so narrow with a cliff wall on one side and a drop of from five to fifty feet or more on the other. I hope one day soon to make some careful measurements of some of the hills round here. Judging by the pictures in *The Motor Cycle* our corners are much worse than yours.

I am hoping to get a powerful twin soon; these hills are just too much for Triumph and sidecar unless the engine is in very good tune, and then you want to be lucky. We (my wife and I) want to have the best sidecar that can be got. But which is it? I had intended to be guided by the A.C.U. Quarterly Trials and the T.T. Race, so you can imagine my disgust when I found that all the leading makers had decided not to compete. As things are now, I think the choice will be a Chater-Lea three-speed, with which Mr. Ware performed so consistently last year.

Pahiatua, N.Z.

C. H. ISAACSON.

#### A Sidecar Experience.

Sir,—Having carefully read the description given by a member of your staff, in your issue of August 1st, 1912, may I take up a little of your valuable space by a description of my experiences with a 6 h.p. Enfield sidecar combination, which I purchased on June 8th.

Since then I have done close upon 3,000 miles, with only one slight mishap, which was on July 20th. I entered for a reliability trial, but through some misfortune missed my way and got twenty miles off the track. I made my time up by travelling about thirty miles at between forty-five and fifty miles an hour, but unfortunately missed a check and got disqualified, my machine having made about the best time of the day. Whilst travelling at the above mentioned speed, I neglected to give the engine more oil, with the result that the bearings got hot and wore the pulley end bush. I ride my machine all weathers, and have been out in such storms lately that no belt machine could have pulled through. I certainly like the chain drive very much, as I consider it is far cheaper than belts, as up to now my chain is showing no signs of wear, and I could never get a belt to run above 500 miles on a similar powered machine. It certainly is a little heavier on tyres, but not much; I had to change my back tyre at the end of about 2,000 miles. With regard to petrol consumption, I can get far better mileage than I could get with a single  $3\frac{1}{2}$  and sidecar, my average mileage is about 70 to the gallon. The writer of the article mentions various details with which he has had trouble, e.g., the gear lever. If he had squirted a little oil into the socket, he would have found that it would

have slipped into gear quite easily without any fierceness. Now the writer also complains of the noise from the valve tappets. Well, you have no other noise to hear, as the engine is so silenced that you cannot hear it, whereas on other machines you cannot hear the tappets for the noise of the engine. The only fault I have to find with the Enfield machine in any way is that it is too quiet, or, to explain, I think it would be better with a cut out, as when you are going through traffic, and running very slowly you have to be constantly sounding your horn to attract attention. I am enclosing photograph of my machine at a surprise check on July 20th. The sidecar passenger is Mr. R. Fearnside (also an Enfield rider), the checker, Dr. Dolan, secretary of Pontefract M.C.C.

Wm. SHARROCK, JUN.

Sir,—Having read with interest your critique of the Royal Enfield sidecar combination, may I trouble you with a short account of experience with this machine. A month ago I purchased a 6 h.p. sidecar Royal Enfield from Messrs. Wauchoppe, taken from stock, and up to now have done 1,100 miles on it, twice driving it through London. In this time I have not broken one valve spring and lost only one nut, viz., the one that screws the mudguard to the carrier. Your article infers that the engine shocks shake all nuts loose. I have not found a single nut come adrift other than this one. After twenty miles I found the gear perfectly sweet to handle, and can now drive through London without a stop. I ran over to Princes Risboro' the other day and climbed Kop Hill with ease with a passenger. The only fault I can possibly find with the machine is that it is difficult exactly to calculate the drip feed, and I have had to stop once or twice to clean the rear plug; this, however, is a matter of experience. Up to now I have not had a puncture in any wheel.

R. C. OWEN-WELLS.

#### The Motor Cycle for Military Purposes.

Sir,—Having at different times read in your paper accounts of military motor cyclists, it occurs to me that your readers may be interested to know how useful and practical motor cyclists are when attached to a telegraph company of Royal Engineers. The company under my command is entitled to an establishment of eight motor cyclists, although up to now only one has joined. This one, however, with a  $3\frac{1}{2}$  New Hudson and sidecar, did splendid work during training this year. On one occasion, on a scheme of telegraph communications, an office was required for a force three miles distant from the base on an existing cable line. The motor cyclist was detailed for this work, and carrying a telegraphist, and a complete office equipment, consisting of a tent, instrument, etc., was able to reach the required spot from the base, tap the line, set up an office, and dispatch a message of ordinary length in less than fifteen minutes. The old method would have been to send a light horsed cart, and more than double the time would have been required. For repairing faults and breakdowns, general orderly work, and intercommunication where no lines existed, he was invaluable, and I only regret that others have not followed his example and joined this most interesting branch of the Territorial Force, although I trust that by next year's training the section attached to this company will be complete. I have not the slightest hesitation in saying that it will be one of the most useful sections in the unit.

Both the two other officers of the company and myself are keen motor cyclists, and all ride Bradburys. We find that the motor cycle, when the work lies on the road and not across country, is far handier and quicker than horses, and it is quite easy for an officer to go over and inspect the whole of an extensive scheme of communication from end to end, when in the limited time available it would often be impossible on horseback.

H. C. SAUNDERS (Capt.).

O.C. Home Counties Div. Telegraph Co., R.E.

#### SUMMARY OF CORRESPONDENCE.

Will "R.G.C." (Bridlington) kindly send his full name and address to the Editor, as several communications are waiting for him.

W. Sharrock, Jun. (6 h.p. Enfield sidecar), in a secret check. (See letter above).

# THE LEA-FRANCIS.

An entirely New Design embodying many Special Features.

Valve side of the new 3 h.p. twin-cylinder two-speed Lea-Francis,

**W**E are able to publish in this article the first description of a new motor cycle shortly to be marketed by Messrs. Lea and Francis, Ltd., of Coventry. This firm's bicycles have made such a name for excellence of workmanship and detail that it did not come as a surprise to us to find that their motor cycles show the same care and thoroughness throughout. As Mr. Ingall, who has charge of the new department, pointed out to us, they have laid themselves out to manufacture a machine which is oil and mud proof, and which can be ridden anywhere without fear of getting dirty. The machine is emphatically not a racer, but at the same time is capable of a very fair turn of speed, and is constructed for comfort and durability. The engine presents no very novel features,

being a twin-cylinder of 60 mm. bore by 76 mm. stroke and rated at 3 h.p. The chief feature of this part is the neat exhaust lifter and adjustable tappets. The exhaust lifter may be adjusted so that each valve is lifted to exactly the same degree, or so that one cylinder may be cut out before the other so as to suit the requirements of the owner.

## An Automatic Carburettor.

A novel automatic carburettor will be fitted which at the present moment we are not at liberty to describe, though we may say that, to our own knowledge, a larger model is giving every satisfaction on a well-known make of car at the present time. Behind the engine, and driven by chain from the crankshaft, lies a Bosch magneto, well out of the way of mud and water, and capable of being moved longitudinally for chain adjustment. Particular care has been taken to place the make and break in an accessible position, and the high-tension wires are carried in metal tubes clipped to the frame by a spring clip. From the engine-shaft also runs a chain drive to a two-speed gear placed in the bottom bracket and of unusual construction. Both the driving and magneto chains are enclosed in an oiltight chain case, which is readily detachable by means of two spring clips. The driven sprocket is mounted loosely between two plates, which it drives through the medium of four coil springs, thus removing all harshness from the drive.

## A Plate Clutch and Two Speeds.

Mounted concentrically with the sprocket is a multi-plate clutch of particularly stout construction, and containing twenty pairs of steel plates. The two-speed gear is of the sliding dog type, and is carried in a phosphor bronze case, which case is mounted inside a special steel casting which forms the bottom bracket. The main gearshaft is eccentric to the bottom bracket, and thus a rotary movement of the gear box in its outer shell

The power unit. The front oil bath chain case has been removed to show driving and magneto chains.

Spring drive and clutch actuation.

Arrangement of exhaust lift and adjustable tappet.

Rear brake shoe and adjustment.

forms a simple adjustment for the driving chain. By a very ingenious construction this movement of the gear box disturbs neither the adjustment of the gear striking mechanism nor the kick starter. Springs are arranged in the gear striking mechanism so as to prevent damage from careless manipulation, and the control is effected by a neat ivory-handled lever carried on a quadrant brazed to the top tube, the connection being made through Bowden wires. From the gear box another chain drives the rear wheel, and this also is enclosed in an oiltight casing.

#### Quickly Detachable Wheels.

The rear wheel is of the quick detachable type, and is driven from the sprocket by means of dogs. It is only necessary to swing up the hinged rear mud-guard and detach one bolt, and the wheel may be entirely removed, leaving the sprocket, chain case, and brake gear *in situ*. So that the wheel may be easily withdrawn from the dogs, a distance piece of slightly more than the depth of the teeth is placed on the side opposite to the chain wheel, and this distance piece is carried on an arm hinged to the frame, so that it cannot be dropped and mislaid. The wheel runs on a ball bearing hub provided with felt washers

so as to keep out mud and also to retain oil. The front wheel is held in the Druid licence forks by means of sunk washers, but, so as to render it easily detachable, these washers are made to stand out from the forks, and have a knurled rim which can be easily gripped. Both front and rear wheels are provided with V brake rims of such a diameter that they do not interfere with tyre removal, and have shoes acting on the inside of the V. This, of course, permits the wheels to be withdrawn without disturbing the brake tackle. The front wheel brake is actuated by the usual hand-grip and the rear by a pedal placed on the right hand side; a similar pedal on the left side operates the clutch, which may also be withdrawn by a hand lever so as to make starting easier. The clutch pedal is of the car type; that is to say, as soon as the pressure of the foot is removed the clutch engages of its own accord, and no heel pedal is necessary. Simple and accessible means are provided for the adjustment of both brakes and clutch.

#### Special Mudproofing of the Machine.

Mudguarding has received very special attention, and both front and rear guards have deep extensions at each side running the complete length of the guards. Long rubber-covered footboards extend from the gear box to the front of the engine, which is encased from below by a neat metal under-screen.

Stands are fitted to both wheels but are of the usual type. The general lines of the frame are very neat, and it is particularly noticeable that the front down tube is parallel to the front cylinder, and that every frame tube, with the exception of the back stays, has a parallel in some part of the frame. A dropped top tube is used, and neat V handle-bars which lie parallel to the top tube and have a sensible drop at the rear to ensure a comfortable position for the wrists. The handle-bar pillar extends upwards through the bars so as to form a convenient fitting for the lamp and generator bracket, and in the open end of the pillar is placed an oil squirt.

Bowden wires are carried inside the bars, and coming out through special lugs at the front they then follow the frame tubes to their respective mechanism, and are supported by special frame lugs and screw caps, thus obviating the necessity for unsightly clips. It may be mentioned that every pin joint works in a hardened and ground steel bush, the pin itself being the moving part. Thus only a new pin is required if wear should occur. There will be no plating except on those parts which it is necessary to see in the dark. The tyres fitted are  $26 \times 2\frac{1}{4}$ . Beyond this description we can only say that the motor bicycle is typical of the Lea and Francis work, and we can scarcely give higher praise.

Three-quarter rear view showing the efficient mudguarding. An underpan is also to be fitted as standard.

# Tyre and Belt Tests in the Six Days' Trials.

## Tyre Judge's Report (abridged).

THE prize offered "for the set of tyres which has withstood the severe conditions of the trial most satisfactorily" has been awarded to the set entered by the Palmer Tyre, Ltd., and carried on F. Smith's 5.6 h.p. Clyno sidecar. In making this award, it was necessary to consider the exact terms of the conditions under which the prize was offered. Those terms are very specific, and are not qualified by any reference to the size or costs of the tyres. [The italics are ours.—Ed.] The condition of the set of tyres to which the prize has been awarded was undoubtedly better at the conclusion of the trial than that of any other set under my observation. In fact, except for the tyre mounted on the driving wheel, it would have been difficult to say that the covers had been used at all, and on the driving wheel cover itself, except for the very slight markings on the outstanding ribs, there were practically no indications of wear. I have placed second the set of 26 x 2½ in wire-edged Hutchinson tyres carried on McMinnies' Triumph, which at the conclusion of the trial were in most excellent condition.

I would also call attention to the excellent condition of the Hutchinson tyres used on A. R. Abbott's Bradbury, of the Stellastic tyres on F. P. Dickson's 6 h.p. Zenith, and the Pedley tyres on Griffith's 6 h.p. Zenith. The latter rider was unfortunate in picking up a large wood screw, which made a bad double puncture in his back tyre on the fifth day, and also carried for some considerable distance a formidable 4 in. nail right through the tread and wall of the tyre, which only just missed piercing the inner canvas. The position of the nail showed that the canvas was very

well manufactured, the fabric having withstood the strain without tearing.

It is only right to call attention to the great difference in price between the tyres thus specially mentioned above and the set to which the prize was awarded. The conditions governing the award do not admit this question of price being considered therein.

The weights of the covers before the commencement of the trial were noted and compared with those at the end of the trial, but it is evident that too much reliance cannot be placed upon this. The fact that in some cases the tyres were slightly heavier at the conclusion shows that the differences do not entirely represent the loss of material from the tyres, which can only be accounted for by assuming that a certain amount of grit and wet had worked into the tyres.

Although the running conditions were extremely severe, a distance of 1,000 miles is evidently not sufficient for an exhaustive test of modern tyres.

The only point in which any tyres appeared to have deteriorated other than in the wear on the tread was in the case of certain covers in which the joint between the bead and the canvas did not appear to have been sufficiently protected.

Evidences of wear at these points, where the rim presses hardest on the cover, were observed, and in all such cases water had soaked through the tyre and had reached the inner canvas. The presence of this moisture right through the wall of the tyre could only have the effect of rotting the fabric.

Size and Type.	Make.	Price.	Used on.	Wheel to which Fitted.	Holes through Cover or other Casualty not Deflating Tube.	Gain or Loss in Weight after Trial	Remarks

# "Brough came roaring along all out" — *Motor Cycling.*

And wherever you find a reference to this rider in the Press reports of the

## A.C.U. Six Days' Trials

you will find a similar note.

And these are the tyres he rode,  
photographed as he finished—the

## JOHN BULL Cross Groove

They are ordinary 26 x 2½ and 26 x 2½ sections—not special sizes, and not specially manufactured.

The machine they shod was a Brough 6 h.p. Twin—not a lightweight—and in spite of the gruelling condition of the roads they came through the whole 1,000 miles without a single puncture, and enabled their rider to win Gold Medal.

That's service, and the actual photograph of the tyres themselves should convince you of the exceptional advantages derivable from the special method of their making.

**Brough knows their worth—do you?**

If not, send coupon below for Booklet, section, and particulars.

To the **LEICESTER RUBBER Co.,

(Signed) F. LINDSAY LLOYD, Tyre Judge.

## BELT JUDGE'S REPORT (abridged).

The accompanying sheet of particulars [Reproduced on the next page.—ED.] shows the details of the belts tested during the Six Days' Trials and my remarks on the condition at the conclusion thereof. (Only belts used on machines which completed the trial are reported.) I have awarded the prize presented for that set of belts which has withstood the severe conditions of the trial most satisfactorily to Messrs. J. Pedley and Sons, Ltd., for their 1in. Pedley rubber belt used on Mr. P. Weatherill's 3½ h.p. Zenith, and placed second in order the same company's ¾in. belt used on Mr. A. J. Dixon's 3½ h.p. Singer.

I would also mention as having gone through the trial in a

most satisfactory manner the set of Service leather belts carried on Mr. W. B. Little's 3½ h.p. Premier. In all these sets of belts one only was used, and in each case only one piece required to be cut off. At the conclusion of the trial they were all in a perfectly serviceable condition and apparently good for use for many more miles.

Examination of certain belts used during the trial showed that considerable deterioration to the belts was caused by the fastener having been badly attached, and in two cases it appeared as if the fasteners used were somewhat too small for the belt, a cross strain at this critical point being thus put upon the belt itself.

## Belt Judge's Report (continued).

No. used.	belt.	Tested on.	Rider.	Shortened	Judge's remarks on condition at the conclusion of the trials.
2	3" Pedley rubber	3 1/2 Quadrant	R. Mundy	—	Both belts constantly damaged through bottoming on the pulley, discarded on 4th day.
2	1" Pedley rubber	6 Zenith	G. Griffith	(a) 2"	(a) Fastener broke 4th day, pulled through 6th day, otherwise in good condition.

The new 2 1/2 h.p. two-speed chain-driven Sunbeam motor cycle with its designer, Mr. Greenwood. The photograph was taken on the Yorkshire hills, where the Sunbeam was behaving very well, during a week-end tour.

# The Motor Cycle Grand Prix de France.

British and American Successes. Team Prize won by the Indians.

## THE GRAND PRIX DE FRANCE.

O. C. Godfrey (Indian twin), the winner, finishing amid great cheering.

**W**HAT promised to be an important and interesting event was the above race, over a course of 280 miles, organised by the Motor Cycle Club de France. Unfortunately, as we pointed out last week, owing to differences between the organising body and the Automobile Club de France, the event was banned by the last-mentioned body and also by the Auto Cycle Union, with the result that the score or so of English riders who had entered decided not to compete. On Thursday the differences were settled and the ban withdrawn, but it was then too late for the majority to make their arrangements.

O. C. Godfrey (twin Indian) and C. B. Franklin (single cylinder Indian), accompanied by W. H. Wells and W. F. Newsome, who was taking over a racing Triumph for Graham Fenton, were the only Britishers to make the journey. The Fontainebleau Circuit, on which the contest was held, is in a very muddy state owing to the recent rain, but this did not prevent fast speeds being accomplished, though several spills were recorded.

A French amateur, de Vay (Triumph), the second to finish

Early on Sunday morning the Boulevard Sylvain-Collinet presented an unusually animated scene. At five o'clock the first competitor was despatched on his long journey of 450 kilometres, the remainder following at half minute intervals. A large crowd of interested spectators watched the start, in spite of the early hour. The length of the laps was thirty kilometres, and this had to be covered fifteen times by motor cycles and twelve by sidecars in twelve hours.

The result was an easy win for O. C. Godfrey, who raced again after a rest of several months. He was mounted on his  $3\frac{1}{2}$  h.p. Tourist Trophy two-speed twin Indian, and his time was 6h. 34m. 59s., equal to an average speed of  $42\frac{1}{2}$  m.p.h. de Vay, on a  $3\frac{1}{2}$  h.p. Triumph, was second in 6h. 55m. 14s., C. B. Franklin (single-cylinder Indian) third in 7h. 5m. 24s. Franklin was delayed by tyre troubles. Bloch (Rene-Gillet) was fourth, time 8h. 9m. 44s. Godfrey's last lap was the fastest, his speed being 46 miles 1,062 yards per hour.

In the passenger class Vanella (Rene-Gillet) was first, with Chartier des Varennes second on an Indian.

Filling up Mon. Raid's 4 h.p. Indian. W. H. Wells is superintending operations. Mon. Raid was fourth in order of finishing.

De Vay (Triumph) after finishing second in the Grand Prix de France.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Aug. 29th	...	7.53 p.m.
" 31st	...	7.48 "
Sept. 2nd	...	7.44 "
" 4th	...	7.40 "

## New Records.

At the Canning Town track on Tuesday morning, Harry Martin, riding a 2½ h.p. Martin-Jap, captured the standing mile record, covering the distance in 1m. 14½s., also the standing five miles record, time 5m. 32s.

## One Race at Next Brooklands Meeting.

At the Brooklands A.R.C. meeting on Saturday, September 28th, there is only one motor cycle event on the programme, viz., the Twelfth Short Race, a handicap for all classes of motor cycles, distance about 5½ miles.

## Streatham Hill-climb.

We are advised that there is already a satisfactory entry in every class at the Streatham and District M.C.C. open hill-climb on September 7th, but further entries will be accepted up till Monday next. *The Motor Cycle* formula will be used, and we are asked to draw especial attention to the cyclecar class.

## A New Engine.

The Enfield machine H. V. Colver was to have ridden in the 150 miles race at Brooklands last Saturday is fitted with a new Enfield engine, which possesses several notable departures in design. It has an outside flywheel, mechanically operated valves, with the inlet valve arranged

Handlebar lugs showing extension for lamp bracket, and oil squirt.

overhead, and, of course, chain drive. Colver was seen on the track with it a month ago, and reported the machine to be extremely fast. This Enfield may yet be the first lightweight motor cycle to cover sixty miles within sixty minutes.

## SPECIAL FEATURES.

A FOUR CYLINDER SINGER CYCLECAR.  
THE NEW LEA-FRANCIS.  
A WEEK IN WATERPROOFS.  
LE GRAND PRIX DE FRANCE (Illus.)

SECRETARY OF THE NEW HARTLEPOOL CLUB.

A new motor club has been formed in West Hartlepool. The existing Motor Cycle Club has joined hands with the car owners to form a strong and-influential club. W. T. Walton, junr. (who has held the secretaryship of the Hartlepool Motor Cycle Club for the last seven years), is to be secretary of the new body. He is seen above on his 3½ h.p. P. & M.

## Canning Town Track.

We understand that the cycle racing track at Canning Town—the only three-lap track in England suitable for speed work—is to be demolished.

## Important Hill-climb Next Saturday.

There are no fewer than 191 entries for the Coventry and Warwickshire Motor Club's seventh annual open hill-climb, to be held on Saturday next, commencing at 1 p.m.

## "The Motor Cycle" Appreciated in America.

We note with interest that the article which appeared in our spring issue under the heading of "How the Power of an Engine is Tested" has been reproduced, even to one of the sketches by an American contemporary. (Of course without acknowledgment.) It is true that most of the article has been paraphrased, but some of it is written word for word and is signed by the ingenious correspondent.

LE MOTOR CYCLE GRAND PRIX DE FRANCE.

The above illustration gives some idea of the tortuous nature of the course. C. B. Franklin, who finished third, is seen going well.

# STERNOL and the A.C.U. 6 DAYS' TRIAL

21 HONOURS SECURED.

**10 GOLD MEDALS**

**5 SILVER** „

**6 BRONZE** „

Evans, in addition to securing highest marks, gained the Silver Cup for  
**Finest Performance on Porlock Hill.**

He went up without his feet touching the ground at any point.

**3 Sternol Users Made Highest Possible Points.**

Of those who dropped out **not a single one** had any engine trouble.

*Standard Quality Sternol Only was used.*

Remember that many splendid results have proved that for speed and power "Sternol" is really the **best** lubricating oil on the market. Motor cyclists using "Sternol" never experience trouble through gumming up, carbonizing, starting from cold or sooting up of plugs. Engine troubles vanish from the time you adopt "Sternol," whilst you will find your chances in hill climbs or any other contest are materially enhanced.

We stake our reputation on "Sternol." Many hundreds of motor cyclists do likewise (and have never been disappointed). YOU can do the same, with the complete assurance of getting better results—all the time.

Write to-day for Price List and particulars.

DESIGNED FOR MAXIMUM POWER,  
with its 3 pure nickel sparking points and pure nickel centre rod  
(PRICE 4/- EACH)

Other plug manufacturers are now including similar characteristics in their productions.

But however closely they make their plugs to resemble Lodge Plugs, they never quite succeed in imitating the essential features which can alone produce equal results. Don't be misled by appearances. Avoid all imitations, which can do nothing but cause disappointment.

Use only genuine LODGE Plugs. BRITISH MADE.  
When ordering, specify "Lodge Motor Cycle type."

LODGE BROS. & Co.,  
Dept. E, New St.,  
BIRMINGHAM.

THE "BAT" Two-Speed Gear.

THE "BAT" Model No. 3, with Two-Speed Gear.

**THE VARIABLE GEAR**  
for motor cycles—whether they be used solo or as a passenger combination—has come to stay. This has been fully proved in all the big trials.

In the

the TWO-SPEED Gear (in which both Shafts run on Ball-Bearings, and which has the pinions always in mesh) is mounted as a countershaft gear, so that neither the engine nor the back wheel is encumbered by it.

Experience has shown this to be the correct position for a variable gear, and thus the "BAT" again leads in correct design. Illustrated Book of the Bat free on request.

**THE BAT MOTOR MNFG. Co.  
PENGGE, LONDON, S.E.**

*In answering these advertisements it is desirable to mention "The Motor Cycle."*

**The A.C.U. Judges' Report.**

The delay in issuing the judges' report of the A.C.U. Six Days' Trials is, we are told, due to the number of protests which have had to be considered.

**End-to-end Sidecar Record.**

We understand that an attempt was to be made on the Land's End to John-o'-Groat's sidecar record, commencing yesterday. A rider named Ellison Hawks, of Leeds, had announced his intention of making the attempt, riding a Rudge Multi. One would imagine that the weather would effectually stop long distance road records of this kind.

**Trend of Design in Australia**

From an Australasian contemporary we learn that the fixed geared machine without a clutch is almost a thing of the past as regards the Dominion, and that 1912-13 contracts are calling for ninety-five per cent. two-speed and free engines. Two firms in New Zealand alone use fleets of forty and twenty-eight motor cycles respectively for business purposes.

**Coventry Club's Open Hill-climb.**

Again the Coventry and Warwickshire Motor Club has secured a record entry for its seventh annual open hill-climb, fixed for Saturday next, the 31st inst. Practically every well-known make of machine is represented, and most of the leading riders will compete. The venue has been kept secret to prevent practising, but readers who desire to witness the climb should apply to Mr. Geoffrey Smith, *The Motor Cycle*, Coventry, for a programme, enclosing stamps for 6½d.

**Experimental Engines.**

A correspondent who happened to be at Brooklands last week was surprised and interested to come across a new engine under test with an overhead inlet valve. Further investigation proved that it was an experimental Triumph. We are not surprised at this, as we saw the drawing of a Triumph engine with its inlet valve arranged on the overhead principle more than a year ago, and we have heard several times during the last two months that it had been seen on the road. Another strange machine which is often seen to emerge from the Triumph works is a two-stroke single-cylinder which appears to run beautifully. Verily, the Triumph Co. will not allow grass to grow under their feet!

**The Tilbury-Gravesend Ferry.**

Our best thanks are due to the many readers who, in response to our request, have kindly sent their experiences of this ferry. Some report very favourably, others the reverse. The fact is that motor cyclists who own sidecars or heavy machines should make use of the carriage ferry, giving notice to the station-master at Tilbury of the time of their arrival, as this ferry does not run regularly. Sometimes the passenger ferry will land the motor cyclist at the carriage jetty at Gravesend, otherwise there are steps to be negotiated on the Kent side. At Tilbury the arrangements are better, and no porters are required, but the approach is very circuitous, and the district uninviting. Anyone who desires to avoid London and the ferry must take the lengthy route given in our issue of March 14th last, page 266.

**FUTURE EVENTS**

- Aug. 31.—Coventry and Warwickshire M.C. Open Hill-climb.
- " 31.—Dublin M.C.C. Open Sidecar Reliability Trial.
- " 31.—Mersey M.C. Open Reliability Trial.
- Sept. 7.—Streatham and District Open Hill-climb.
- " 7.—Liverpool M.C.C. Open Reliability Trial.
- " 14.—B.M.C.R.C. Race Meeting.
- " 14.—Torbay M.C.C. Open Hill-climb.
- 16.—Edinburgh and District M.C.C. Open Hill-climb on Amulree

**Presentation to a Lady Motor Cyclist.**

Miss Muriel Hind was recently the recipient of a gold watch bearing her monogram presented by the Rex staff and employees as a token of their appreciation of her riding. A short time back the same lady was presented with a splendid silver cup as a souvenir of the Irish End-to-end Trial. It was subscribed for by the other competitors.

**Brooklands Meeting Postponed.**

The B.M.C.R.C. meeting that was to have been held at Brooklands on Saturday last, 24th August, was unfortunately rendered impossible by rain. We understand that it has been postponed to Saturday, 14th September next, which represents the next Brooklands meeting.

of the B.M.C.R.C. There was great disappointment when it was seen that the event must be put off, as the 150 mile race had attracted a representative entry with promise of good sport being witnessed.

**Motor Cyclists and Army Manœuvres.**

A very large number of motor cyclist members sent in their applications to be included in the A.A. and M.U. contingent for the manœuvres to be conducted from September 14th to the 20th. The necessary number have been selected to serve, and those not selected have been asked to signify their willingness to serve in the event of additional motor cyclists being required at the last moment. Those who have been selected must attend at the rendezvous on Friday, the 13th prox., the day prior to the manœuvres.

**"English Machines Obsolete."**

Thus reads a cross heading in an American paper on motor cycle doings in Vancouver, B.C. "The English machine," it says, "is almost obsolete, while five years ago they were the only make in use; the superiority of American goods has proved itself more than equal to the task of clearing the boards here as it has in other sections of Canada. The same failings mark their exit here as in other parts of the country, namely, too light a construction for severe conditions, small wheels and tyres, low clearance between the crankcase and road, weak spring forks, and last but not least it is a long wait for a replacement from England."

**A THREE-SEATED MOTOR BICYCLE**

The above strange-looking N.S.U. machine, which belongs to a Coventry motor cyclist, was snapped in Warwick a short time ago. The owner regularly takes his wife and daughter about with him, the seats being arranged, one on either side of the bicycle and another at the rear.

# The Reliable Douglas

Five Vibrationless Douglas Lightweights

were entered in the

Six Days' Reliability Trial

## ALL FIVE

SUCCESSFULLY COMPLETED THE COURSE

and secured

ONE GOLD MEDAL

TWO SILVER MEDALS

and

TWO BRONZE MEDALS

Miss Hammett, riding a Douglas, was the only lady rider to complete the Trial on a Lightweight.

## SPEED TRIALS AT PORTMARNOCK.

The Dublin and District Motor Cycle Club held their fourth speed trials of the season, on Saturday afternoon, at Portmarnock. The weather was favourable, but there were an unusually large number of gullies across the course. The novices' race was won by a new member. Results:

Two Mile Novices' Handicap (engines of unlimited capacity): 1. C. Dunkley (5 Indian), 28s. start; 2. C. Bayton (3½ Triumph), 15s. start; 3. V. J. Farrell (3½ Triumph), 40s. start. Won easily. Winner's net time 2m. 47½s.

Four Miles Scratch Race (unlimited capacity): 1. F. J. Walker (3½ Rudge); 2. C. Bayton (3½ Triumph); 3. J. Healy (3½ Rudge). Won very easily. Winner's time 5m. 8½s.

Twenty-six Miles Open Handicap (unlimited capacity): 1. F. J. Walker (3½ Rudge), 3m. start; 2. T. E. Green (3½ Rudge), 3m. start; 3. C. Dunkley (5 Indian), 4m. start. Won by 38s. Winner's net time 33m. 32½s.

Walker (Rudge) who won two out of three races at Portmarnock on Saturday. He is seen turning in the twenty-six miles race.

## PHILIPSON'S SELF-GOVERNING PULLEY.

WE recently had the opportunity of inspecting this ingenious device fitted to a Triumph machine. This pulley is made in two patterns for racing and touring purposes. The principle of each is the same, but the racing pulley, which was the one we saw, is

provided with a stronger spring; this causes the gear to rise more quickly to the maximum, where it will remain under all ordinary circumstances, a slight pressure on the outer surface of the revolving ring, which surrounds the spring box, being required when it is desired to lower the gear. This can be done by the rider's heel or by means of a small brake shoe actuated by a Bowden wire and lever on the handle bar. A very slight touch reduces the gear as required on a hill or when turning a corner, and, when released, the gear returns gradually and automatically to the maximum as the road conditions permit. The touring pattern has a lighter spring and is entirely automatic.

We are requested not to describe the mechanism in detail at present, but we can say that the gear is extremely simple, and the photograph which we publish shows that it has a very neat appearance. It is quite foolproof and cannot be made to jam; there is no end thrust, and it is self lubricating. The maximum gear can be set in any desired position within the limits of the gear, and it is a matter of half a minute or less to alter this maximum. Even when the belt is loose it is gripped tightly between the two flanges of the pulley, and it is impossible for belt tension to force the flanges apart, which might conceivably happen in a gear controlled only by a spring. Another point worth noting is that as the belt is continually rising and falling in the pulley the latter is worn evenly and not in a groove—a con-

B. B. Harvey (7-8 Bat), the scratch man in Saturday's races, getting under weigh. It is interesting, also, to note that the pulley is to be made for fitting in the counter-shaft, where, owing to the large diameter allowable, it should be very effective. As belt adjustment is so seldom necessary Mr. Philipson proposes to connect the ends of the belt by a couple of plates only, thus bringing the ends close together. If a fastener is used it is a good plan to wrap a greenhide lace round the link in the manner shown in the small sketch. This prevents the ends of the belt wearing and subsequently pulling out.

## LONDON TO YORK RIDE.

Entries for the Essex Motor Club's annual run to York and back on August 30th-31st are given hereunder:

C. H. Corfield (C. and H. cyclecar)	A. T. Stanton (3½ Bradbury sc.)
D. S. Parsons (G.W.K.)	A. E. Brassington (6 Rex sc.)
G. T. Gray (3½ Rudge)	G. E. Revill (8 Zenith sc.)
Frank Roberts (3½ Rudge)	A. J. Sproston (3½ Rover sc.)
A. da Silveira (7 Indian)	W. H. Wells (7 Indian sc.)
A. A. Lilley (3½ Singer)	E. Frasseti (7 Indian sc.)
Harold Karslake (3½ Rover)	B. A. Hill (7 Indian sc.)
L. G. Brown (3½ Triumph)	W. Keir Smith (7 Indian sc.)
J. H. Kerr (3½ N.S.U.)	C. F. Mitchell (6 Bat sc.)
P. D. Walker (3½ Rudge)	R. Lord (6 Rex sc.)
A. H. Gold (3½ Ariel)	J. S. Holroyd (2½ Moto-sacoché sc.)
H. J. Beal (3½ N.S.U.)	G. L. Fletcher (2½ Douglas sc.)
J. A. Neumann (3½ Rudge)	V. Garland (6 Clyno sc.)
A. V. Deacock (6 N.L.G.)	

The start will take place at 7 p.m. to-morrow (Friday).

Philipson's Self-governing pulley fitted to a 3½ h.p. Triumph.

Start of the Novice Race in the Portmarnock Speed Trials last Saturday—Dunkley (5 Indian), the ultimate winner, is the second on the left.

#### Ayr and District M.C.C.

The annual one day trial was held over a 260 mile course via Kilmarnock, Glasgow, Bowling, Balloch, Luss, Tarbet, Cairndow, Inveraray, Dalmailly, Taynult, and Oban, returning the same way. With the exception of Miss May Senior, who suffered from tyre trouble, all arrived at Arrochar up to time. There were several falls on Rest and be Thankful. G. Cocker broke his oil pipe owing to his back brake jamming, which caused him to fall, and W. Munro

A few of the competitors in the Westmorland M.C.C. Hill-climb, held on Underbarrow Scar last Thursday.

had his back tyre blow off the rim in Kilmarnock. Gold medals: W. Allen ( $3\frac{1}{2}$  Triumph), H. Andrew ( $3\frac{1}{2}$  Triumph), F. K. Dickson ( $3\frac{1}{2}$  B.S.A.), J. Gilchrist ( $3\frac{1}{2}$  T.T. Triumph), A. J. C. Lindsay (6 Matchless), J. Meredith ( $3\frac{1}{2}$  P. and M.), W. Munro ( $2\frac{3}{4}$  Douglas), and A. Reaves ( $3\frac{1}{2}$  Rudge). Silver medals: G. Cocker ( $3\frac{1}{2}$  Rudge Multi) and J. McKervail ( $3\frac{1}{2}$  Triumph).

#### Leeds M.C.C. and Sheffield and Hallamshire M.C.C.

An inter-club flying kilometre speed event will take place in Stapleton Park, near Pontefract (by permission of Mr. Hope Barton), on September 7th. There will be eight classes.

#### Leicester County M.C.C.

The Leicester County M.C.C. is a newly founded organisation, and, although only formed a fortnight ago, already numbers over forty members. President, Mr. J. G. Shields, J.P., C.C.; hon. secretary, Mr. J. Dignan, Bell Hotel, Leicester.

#### Evesham M.C.

The results of the speed trial held on the 22nd inst. over a half-mile course were as follows: 1. H. W. Wynn ( $3\frac{1}{2}$  Rudge), 31s.; 2. B. Longford ( $3\frac{1}{2}$  Rudge), 32s.; 3. A. Bladder ( $3\frac{1}{2}$  Rudge), 34s.; 4. G. Hitchings ( $3\frac{1}{2}$  Triumph), 35s.; 5. D. Young (8 Williamson sc.), 38s.

#### Lincolnshire A.C. (Motor Cycle Section).

A hill-climb on the knock-out principle will be held on Scamblesby Hill, on the Horncastle and Louth Road, on Saturday, September 7th, at 3.30 p.m. There will be three classes: No. 1 up to 350 c.c., No. 2 up to 600 c.c., and No. 3 over 600 c.c. Two yards start will be allowed for each 5 c.c. difference in the cubic capacity of the engine.

#### Clapton and District M.C.

A reliability trial was held on the 18th inst. from the Swan Hotel, Clapton Common, to Bishops Stortford and back. There were ten starters. Results:

	Total error.
1. P. Bowman (4 J.A.P.) ... ..	10m.
2. A. Hewitt ( $3\frac{1}{2}$ Triumph sc.) ... ..	11m.
3. { G. Blain ( $3\frac{1}{2}$ Kerry-Abingdon sc.) ... ..	12m.
{ G. Davey ( $3\frac{1}{2}$ Kerry-Abingdon sc.) ... ..	12m.
{ A. Smith ( $2\frac{3}{4}$ New Hudson) ... ..	12m.

Sheffield motor cyclists at Owl Bar last week-end. They are not downhearted in spite of the weather.

Willesden Lane, Kilburn, N.W.

Telephone—8843 Paddington.  
Telegrams—"Expansible, London."

COVENTRY—St. Mary Street.  
NEW YORK, U.S.A.—1780 Broadway.  
PARIS—12, Rue de Courcelles.

**Torbay and District M.C.C.**

The second annual open hill-climb has been arranged for September 14th on Halsangai Cross Hill, which is about three-quarters of a mile long. It is said to be quite safe, being almost straight for its whole length and very slightly curving at the top, and will therefore be a fair test of machines. There are nine classes, including one for ladies and another for cyclecars. Entry forms and full particulars will be sent on application to Mr. A. Powell, 37, Fleet Street, Torquay.

**Mersey M.C.**

An open reliability trial will take place on the 31st inst. The start will be made at 8 a.m. from Hamilton Square, Birkenhead. The route will be Birkenhead, Chester, Tarporley, Stone, Cheadle, Mayfield, Ashbourne, Matlock, Bakewell, Tideswell, Bradwell, Hope, Chapel-en-le-Frith, Alderley Edge, Knutsford, Warrington, Cronton, Liverpool (Broad Green).

Competitors will be started in pairs and under pain of disqualification they must ride together. Each competitor is credited with 1,000 marks. Marks will be deducted as follows: Failure to climb any hill 50 marks, pedalling or foot assistance on any hill 25, stop due to tyre troubles 5, any other involuntary stop 20, for each full minute early at any control 3.

Each competitor acts as observer to his comrade, and in the event of a stop must wait and make a note of the cause. If, however, the stop is unduly prolonged after carrying out certain prescribed forms, he may proceed with the pair of riders that follow.

The committee of this club would welcome the assistance of any readers willing to act as marshals and observers on the route of the open reliability trial on August 31st. Applications should be made to Mr. S. W. Carty, hon. secretary, 5, Redcross Street, Liverpool.

**Dewsbury M.C.**

The second reliability trial of the year was held on Tuesday last, the prize being the Bat cup and gold medal. Result:

	Marks lost.
1. F. H. Dunstan (3½ Rudge) ... ..	3
2. S. Naylor (3½ B.S.A.) ... ..	10
3. C. Sydney (3½ Bradbury) ... ..	11

**North Staffordshire M.C.C.**

The third reliability trial for the Ashton cup took place on the 18th inst., starting from Whitmore and proceeding to Whitchurch, Bangor-on-Dee, Llangollen, Ruthin, Mold, Chester and back to Whitmore; distance, 111 miles. Results of this trial: G. Jones (3½ h.p. Zenith), 100 marks; G. Tagg (4½ h.p. Regal-Precision), and W. Palmer (3½ h.p. Triumph), tie for second place, 99½ marks; J. A. Prendergast (3½ h.p. Ivy-Precision), 95 marks; F. Tagg (5 h.p. Indian), 95 marks; R. H. Attwood (3½ h.p. Bradbury), 89 marks. Final results: 1, J. A. Prendergast (3½ h.p. Ivy-Precision), Ashton cup; 2, G. Tagg (4½ h.p. Regal-Precision), gold medal.

**Tunbridge Wells M.C.C.**

The third trial of a series of four for a challenge cup presented by the president, Col. Sladen (the mayor), took the form of speed trials, the previous trials being a petrol consumption test and a hill-climb. The speed trial was held over a half-mile course, the result being:

1. Brown (3½ Rover) ... ..	32½s.
2. Rumens (3½ Singer) ... ..	33½s.
3. Carey (3½ B.S.A.) ... ..	36½s.

It was a distinctly unfavourable afternoon for such an affair, the rain falling at intervals in torrents, which called for a considerable amount of pluck on the part of the riders owing to the wet state of the road and the high wind, consequently the times recorded were very creditable.

## A PASSENGER TRIAL IN YORKSHIRE.

THE two days' trial organised by the Harrogate and District M.C.C. attracted twelve entries of which eleven started. The first day's run was to Bridlington and back (130 miles), the competitors having to check in at numerous places, and climb Garrowby Hill without a stop. This hill accounted for C. Kenny (4 h.p. Singer sc.), G. Shepherd (3½ h.p. B.S.A. sc.), and W. Atkinson (3½ h.p. Scott, sc.). C. A. Nettleton (3½ h.p. New Hudson sc.) was late at a check in consequence of tyre troubles, thus there were seven to start on the second day over a far more difficult route including such hills as Pot Bank, Leathley Bank, Norwood Edge, and Gays Cliff (Yorkes Folly). E. R. Davies (6 h.p. Matchless sc.) did not start, and the remainder

ran on without trouble to Yorkes Folly, which caused the downfall of W. Aldon (3½ h.p. Premier sc.), H. W. Fortune (3½ Brown sc.), W. Hill (3½ Scott sc.), and G. Hill (3½ Scott sc.).

**Two Inseparables.**

Consequently, W. Fawcett (6 Zenith sc.) and W. Turner (8 Morgan) were the only ones to finish with a clean sheet. To find a winner, these two were required to climb Brownstay Ridge, and this being satisfactorily accomplished they were then called upon to make a five miles non-stop run and again climb Yorkes Folly. Again they were successful, so the officials decided to give both of them a gold medal, and H. Fortune takes third prize for having climbed the furthest up Yorkes Folly of the remaining competitors.

W. Turner (8 h.p. Morgan runabout) climbing Guy's Cliff, near Pateley Bridge—a hill which accounted for the most failures.

W. Fawcett (6 h.p. Zenith sidecar) negotiating the worst bend on Guy's Cliff in the Yorkshire passenger trial.

## QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Abnormal Petrol Consumption.

**?** I have a  $3\frac{1}{2}$  h.p. Precision engine and a standard carburetter with a 32 jet in it, and can only get about 40 m.p.g. out of it. I have tried a smaller jet, but it will not pull. Is it possible for the engine to be at fault or the carburetter, and can you give me any advice?—S.W.W.

28 to 32 is about the normal size of jet for the cubic capacity of the engine in question. The reason it will not pull when you fit the smaller jet is because the choke tube is probably too large. If you reduce the choke tube in proportion to the size of the jet you will probably find the engine pull all right and be more economical. Forty miles to the gallon is ridiculous consumption for an engine of this size. Probably there is some waste taking place somewhere, either at the extra air inlet, or there may be some leakage in piping, tank, etc., which you have not discovered.

### Wood Green to Folkestone.

**?** Would you be kind enough to give me the best route from Wood Green to Folkestone, avoiding, as far as possible, traffic through London and bad hills. My machine is a 5-7 h.p. Chater-Peugeot and sidecar. I am an absolute novice, and have not ridden more than seventy miles yet altogether. What is the distance, and what time do you think it ought to take me? Could you tell me what mileage I ought to do on a gallon of petrol?—J.R.B.

Wood Green is rather awkwardly placed for reaching the Folkestone Road. To miss the traffic you would have to make a very long detour. What we should advise you to do is to start on Saturday or very early in the morning and make for the junction of the Brixton and Clapham roads. Here you will find signposts to Folkestone and Dover. The whole road is signposted by the A.A. and M.U., and you cannot mistake it. The only other alternative is to make your way from Wood Green and go through Green Lanes, Tottenham Hale, past the White Hart, Black Horse Road Station, following the blue road marked on the R.A.C. official map of recommended routes round and across London (which can be obtained, price 1s. 7d. post free, from these offices). This will clearly show you the way of avoiding the traffic. The route marked blue joins the Folkestone Road

just beyond Bromley. The distance from London to Folkestone is seventy-six miles. Driving at twenty miles an hour, it would take you about four hours. You could probably run about 60 m.p.g.

### Engine Stiff at Starting.

**?** I have a 1912 F.E. motor cycle, and when starting it up for the first time each day it gives a lot of trouble before it will start; it is almost as much as I can do to pedal round with the exhaust up, but directly it has once started it runs beautifully and will start up again perfectly. I have tried injecting petrol, but this only helps a little. Is the piston a little too tight? I should be obliged if you would tell me what is wrong and how to remedy it.—R.H.W.

If the piston moves easily in the cylinder of your engine after the engine had been running it looks as if you might possibly be giving the engine too much oil, and do not put enough petrol into the cylinder when starting from cold. It is unlikely that the makers would fit a piston that was too tight, but it is possible that expansion of the cylinder under heat might enable a slightly tight piston to run freely.

### Starting from Cold.

**?** My mount is a 1912  $3\frac{1}{2}$  h.p. two-speed. I find it rather difficult to start by means of the kick starter when the engine is cold, and in consequence wish to fit dry battery and coil ignition only for starting purposes, using the Lodge two ignition plug. Will you please let me know whether this is practical. I take it that the contact breaker can easily be fitted in continuation of one of the gear wheels that drive the magneto. The coil and battery will be carried in the sidecar.—INDIA.

You do not want battery ignition to enable the engine to start readily when cold. The trouble is that the engine is not free, and therefore does not revolve quickly enough to get a good spark and suction on the carburetter. If you inject a little petrol or paraffin through the compression tap to ease the piston ring before starting, you will find the engine will start quite readily with a kick starter. We should not advise you under any circumstances to attempt fitting dual ignition, although it could be fitted, as you say, to a continuation of one of the gear wheels that drive the magneto; it would, however, be a costly process.

## BOWDEN CONTROL LEVERS

No. 413  
Curved,  
8/-

See that all your levers bear the **Genuine Trade Mark**—It has no name of a Town beneath it—only just **REGD.**

No. 403  
Curved  
6/-

When buying control levers see that you profit by the years of expert concentration which alone has made our levers as perfect as they are. Those illustrated above are our best pattern single and double control levers. They are made from solid stampings, and can be supplied for right or left hand, and in two designs; straight or curved. Similar levers made from pressed steel can be supplied to give one, two, or three operations at 4/-, 6/-, and 9/- respectively.

Please send for our 1912 Catalogue, and note that our only address is—

## The L.M.C. for RELIABILITY.

Alford, Lines.,

Aug. 16th, 1912.

Dear Sirs,—I should like to take this opportunity of letting you know how very pleased I am with the machine. The engine seems so much more powerful than other 3 1/2 machines and lately I have been using a sidecar. Have just come up here from Portsmouth, 218 miles in one day.

Yours faithfully,

R. M. G.

(Surgeon, R.N.).

# 100%

## SUCCESS in the SIX DAYS' TRIALS.

Four L.M.C.'S took part in this strenuous test

# All Four Finished

AND SECURED

## 3 GOLD MEDALS and 1 BRONZE MEDAL.

THE IDEAL MACHINE FOR TOURING IN THE L.M.C.

Makers: The LLOYD MOTOR ENGINEERING CO., LIMITED,  
L.M.C. Works, Monument Road, BIRMINGHAM.

309, Monument Road, Birmingham,

August 15th, 1912.

Dear Sirs,—I wish to acquaint you with the satisfaction I feel at the performance of my new 4 h.p. L.M.C. motor bicycle.

I have recently put the machine to a severe test, having accomplished 400 miles in four days with a sidecar and 16 stone passenger, myself, the rider, 10 stone 6 lbs., and personal luggage totalling up to 30 stone.

During start of this ride we encountered several very bad hills viz., on the Brighton Road, all of which the machine surmounted, the Sturmer-Archer Three Speed Gear showing a valuable acquisition.

In conclusion, I may say that the machine easily surpasses all my expectations in the amount of power developed.

Yours faithfully

(Signed) J. B. PAYNE.

**The Isle of Wight.**

? Will you kindly let me know what it costs to take a motor and sidecar from Portsmouth to the Isle of Wight? Are the usual licences available, and are the roads on the Island good?—A.C. The cost of transport from Portsmouth to Ryde is 1s. 6d. The Isle of Wight is as part of the county of Hampshire, so the licences are the same. The roads in the Island are good but winding and hilly.

**Adjustable Pulleys.**

? I have had considerable trouble with my adjustable pulley. The cap which keeps the locking nut for the near side of the flange comes off. The old pulley was right hand thread, and when I lost a cap it screwed up and spoilt the thread. I had a new pulley fitted recently. This had left hand thread, but the cap soon came off. I had just adjusted the pulley, and had screwed the cap on as much as I could, standing on the pedal to get it tight; yet it came off when I ran the engine on the stand to see if it was all right. I have an Armstrong three-speed gear. Would a plain pulley suit me? I always run with sidecar.—J.B.

makers should be able to advise you a case of this kind. If their method of locking the flange is not satisfactory they should supply you with a pulley that is reliable. We have always understood that the locking ring should be a right hand thread and the flange a left hand. You can easily obtain an adjustable pulley which will give you no trouble. Your old pulley will probably have to be sent for the makers to bore their pulley to the correct taper, or you could order it with a plain hole and get it tapered locally.

**A First Machine.**

? I am intending to purchase my first motor cycle in the course of the next week or two and shall esteem it a favour if you will assist me to a decision. (1.) Is it advisable for a novice to choose a lightweight, and if so, on what ground? (2.) Would the vibration from a single-cylinder lightweight be such as to render a twin desirable? (3.) How would the cost of running such a twin compare with that for a single? (4.) Would such a motor cycle be capable of taking anything but a "freak" hill on top gear, or would it be advisable to have a variable gear to compensate for the low horse-power? (5.) Do you advise a second-hand motor cycle for a novice entirely without technical knowledge?—F.J.T.

(1) It depends entirely on the man. If the novice is an old pedal cyclist and not over 35 we should not recommend a lightweight in preference to a heavyweight if the prospective owner likes a little speed occasionally. The only reason why we sometimes recommend that a novice should choose a lightweight machine is because, generally speaking, a lightweight is easier to handle and control, and, in these days of variable gears, a lightweight of good make is truly fast on the top gear, and will climb practically anything. (2.) Not if the machine is fitted with a well balanced

single-cylinder engine. A twin is, of course, more comfortable than any single, and if you require to have the least vibration, doubtless a good twin would be desirable. (3.) The additional cost of running would be hardly noticeable with a twin, the cubic capacity of which did not exceed that of the single by very much. (4.) We always advise a variable gear in any case. (5.) A second-hand machine not more than a year old would be almost as good in the hands of a novice, or anyone else, as a new one, but you ought to have expert advice before purchasing.

**An Explosion in the Crank Case.**

? I should be much obliged if you could explain to me the cause of a cylinder explosion. My cycle is a 3½ 1909 model, mageto and h.b.c., and one morning I took it out to have a run but could not get it to start. (I was surprised, as it started quite easily the previous evening, but before doing so I noticed a bluish spark come from somewhere near the plug.) I tried to start it on the stand and the pedals went round quite easily, but as soon as I dropped the valve lifter the cylinder broke into pieces, also breaking lower part of piston. I noticed after flooding the carburetter it seemed to overflow and stream out from the bottom of the jet chamber for a few minutes and then stop. Would this have anything to do with it?—J.T.

The bluish spark you mention coming from somewhere near the plug was obviously a short circuit. The explosion apparently occurred in the crank case below the piston and, therefore, must have been caused by a collection of vapour in the crank case. Had the spark you

mentioned set fire to vapour arising from a flooded carburetter it would not have burst the cylinder and broken the piston. It would simply have burst into flame. How the petrol got into the crank case we cannot imagine, but if the explosion had occurred above the piston it would have blown off the combustion head, whereas occurring below the piston it has broken the cylinder off above the flanges. It is difficult to account for these explosions without being in close touch with the machine at the time of the accident.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"BD 1355" (Irthlingborough).—G.W.K. cyclecar.

"Dono" (Scotland).—Marlborough light car.

"G.W.J.M." (Kent).—Wilkinson T.M.C. for solo and passenger work, particularly as regards flexibility.

"S.C." (Fulham).—1911 T.M.C. with sidecar for business purposes. General reliability, wear of gears and tyres; also, 1911 F.N.

"J.P." (Capetown).—8 h.p. Matchless and sidecar. Running cost, petrol consumption, double belt drive, and change-speed gear.

"W.T." (Mysore).—5 h.p. four-cylinder F.N. and four-cylinder T.M.C. with sidecar. Hill-climbing, speed, and upkeep.

"J.W.A." (Jersey).—Roc two-speed gear fitted to Humber.

"E.A.L." (Brixworth).—1912 3½ h.p. two-speed Kerry-Abingdon.

IN CHEDDAR GORGE. R. C. Davis (Chater-Lea sidecar) and F. Hill (A.C. Sociable), Six Days' Trials competitors, climbing the ascent through Cheddar Gorge, abreast.

Several competitors in the Six Days' Trials had trouble with water entering the magneto. It usually runs down the high tension wire. Our sketch shows a simple remedy. Obtain a good tyre patch, cut a hole in the centre and force the wire through it.

#### Sidecar Wind Screens.

J. A. Taylor and Co., 241, Balfour Road, Ilford, Essex, inform us that they hold the sole patent rights for sidecar screens, and have obtained an injunction against infringers of their design.

#### Catalogues Received.

A very voluminous catalogue is published by the Rotax Motor Accessories Co., Ltd., 43-45, Great Eastern Street, E.C. A speciality is the Rotax motor cycle lamp, the generator of which is somewhat of a departure from the usual form. Some very neat tool kits are also listed, and a variety of tools of interest to motor cyclists.

The latest 1912 catalogue of Hunts, Ltd., 117, Long Acre, W.C., is particularly well got out, and lists everything from complete motor bicycles and sidecars to the smallest accessory.

The Lukin carburettor is a most interesting device, and a study of the method of construction will interest the majority of motor cyclists. The carburettor is fully illustrated and described with lettered drawings in a new catalogue just published by Lukin, Ltd., The Ride, Newcomen Street, Borough, London, S.E.

We are in receipt of the latest catalogue of the A.J.S. motor cycle (A. J. Stevens and Co., Ltd., Retreat Street, Wolverhampton), which is one of the most popular up-to-date lightweights in the kingdom. The models described are the 2½ h.p. lightweight and the 5 h.p. passenger machine. Each model is lucidly explained, and illustrations and drawings are given of the gear box and component parts thereof, and the transmission. In the Six Days' Reliability Trials, out of the five machines entered four gained gold medals and one a silver medal, the latter losing the fifth gold medal by 18 marks.

A new luggage grid, a special fitting which may be obtained with the Enfield sidecar combination.

#### Belt Fasteners and Belt Drifts.

The Aston Motor Accessories Co., Talford Street, Aston, Birmingham, give a guarantee for one year with their belt fastener and belt drift, and claim that the fasteners are practically unbreakable. The belt drift forces the canvas of the belt sideways instead of cutting it, thereby increasing the life of the belt at the joint.

#### Business Announcements.

H. Martin and Co., Leslie Grove, East Croydon, are enlarging their premises and forming themselves into a limited liability company.

P. Platt, the well-known Bradbury rider, will shortly open premises at 129, Union Street, Oldham. He will hold the sole agency for Bradbury and other well-known motor cycles.

G. W. Baker (2½ Singer) who covered 3 miles in 3 min. 42½ secs. and 5 miles in 6 min. 40 sec. on the New Brighton track on Bank Holiday Monday.

#### A Good Record.

A Pedley belt was used on George Griffith's 6 h.p. Zenith Gradua which obtained a gold medal in the Scottish Six Days' and also in the A.C.U. Six Days' Trials.

#### American Police and Speedometers.

It is well known that the American police use the motor cycle to a very large extent in the execution of their duties. All their mounts are equipped with speedometers, and the Jones is the favourite among them. The facsimile of a letter has been shown to us, received by Markt and Co., Ltd., 98, Clerkenwell Road, E.C., from Captain Stiles, West Chicago Park Commissioners, Police Department, who is most enthusiastic concerning the accuracy of these speedometers.

#### Sparking with a Big Gap.

We had a very curious experience the other day with a sparking plug. The plug became damaged through the breaking of a valve, with the result that the electrode attached to the body of the plug was bent inwards, so that a plug gap of slightly over ¼ in. was left. Some experts who saw the plug bet the owner that he could never start the machine or get it to fire with the gap. However, the bet was accepted, the plug was put in, and at the second revolution of the pedals the engine started, and fired fairly regularly. The magneto was the new waterproof Bosch, and the experience related speaks well of the excellency of its sparking powers.

#### Fan Dynamometers.

We are asked to point out that the description of engine testing by means of fan brake dynamometers published in our issue of March 21st, and used by Rudge-Whitworth, Ltd., is W. G. Walker's patent. This firm have now issued a license to Rudge-Whitworth, Ltd., to use and manufacture dynamometers for their own use, and are willing to grant licenses for others. The address of the firm is W. G. Walker and Co., Emery Hill Street, Victoria Street, Westminster, S.W.

#### Six Days' Trials Notes.

Winners of ten gold, two silver, and two bronze medals in the A.C.U. Six Days' Trials used Monogram oil as their lubricant.

The 6 h.p. Royal Enfield sidecar combination driven by H. V. Colver in the Six Days' Trial was taken out on the one fine day last week, without any overhauling, for a test up Sunrising Hill. The passenger seat was occupied by Mr. J. Urry, of Birmingham, by no means a lightweight, and after running at top speed from Redditch, Sunrising was climbed without a falter. A few minutes afterwards the same machine made another ascent with three up, including the driver. Directly afterwards another ascent was made from a start some distance up the hill, with Mr. Urry in the sidecar and another passenger on the carrier. Thus, the machine which had undergone the strenuous Six Days' Trial demonstrated that it had lost little, if any, of its tune by making three ascents of Sunrising within a quarter of an hour, and on two ascents the combined weight of the driver and two passengers totalled 35 stones.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

**We are not hanging on to stock. We are clearing it!**

We are not old-fashioned. We are not going to hang on to our stock till we can sell every machine at the price we would like to. NO; we prefer to sell half or three parts of it NOW before the winter, even though we know we are selling machines at prices far less than we can get for them if we keep them over till the spring.

We consider it better business to turn the money over to sell our existing stock NOW and to replace it.

Therefore, we have prepared a list of every machine we have, and we are going to refuse nothing reasonable

**Tell us your requirements**

**Lightweights 1910 & 1911.**

Douglas, Enfields, Moto-Reves, Motosacoche, all recent models, magnetos, overhauled, etc.

From £14 to £30.

**3½ h.p. Models, 1910 & 1911 fixed or free engine or variable gears.**

Triumphs, Premiers, Zeniths, Bradburys, Singers, Kerrys, etc., all overhauled, and good machines.

From £20 to £35.

**1912, 3½ h.p. machines, good as new.**

Rudges, Premiers, Zeniths, B.S.A., New Hudson, soiled only, or used for trial runs.

Bargains from £35.

**Call or write for a list**

Make us a cash offer, and if we can let you have the machine, we will do so.

Further than this, we can let you get a certain number of machines to customers who may prefer to extend the payments rather than purchase in a lump sum.

We would prefer cash offers, and, of course, the cash buyer gets the best bargain.

In any case, if you are scanning the pages of this paper in search of a bargain—you have struck it here.

**Then make us an offer**

**COLMORE**  
35, Colmore Row Birmingham.  
18, Renshaw Street Liverpool.  
261, Deansgate, Manchester.  
62, High Street, Leicester.  
45, John Bright St., Birmingham.

### Warning Signs.

THE observant reader who travels about the country a great deal must at some time or other have been impressed by the number of red warning triangles which now abound. Equally so notice must be attracted by the careless selection in some instances of so-called danger spots. These red warning triangles are intended as a warning to road users to proceed with caution, but every sensible motorist never does otherwise so long as narrow and twisty roads abound. The purport of this article is to recommend that more careful selection be made of real danger spots, or there is grave fear that the numerous warnings will defeat their own object. In other words, we have of late noticed warnings of so-called danger points which naturally caused us to slow down and proceed cautiously, only to find that there was no real danger at all, but perhaps only an entrance to a private carriage drive. This sort of thing frequently occurs, until at length the motorist who may be desirous of losing no time is tempted to take liberties, thinking the sign an unwarrantable one, and in so doing encounters at too fast a speed a really dangerous place. It would obviously be absurd for every by-road, carriage drive entrance, and such like to be marked with danger signs, and this brings us to another aspect of the question. Why should the continual stream of traffic on a main road be checked for the occasional by-road user? Would it not be far more sensible to warn the by-road user that he was about to enter a main road, and consequently that it was his duty to proceed slowly and cautiously? It seems a far more reasonable plan to warn the minority rather than hold up every user of the road.

### Cyclecar and Sidecar Bodies.

THE last few weeks have brought out a considerable amount of information regarding cyclecars for 1913, and we notice that one or two designers of these vehicles have had sufficient forethought to provide them with bodies of reasonable width. There are, however, a number of experimental cyclecars and sidecars on the road with ludicrously restricted bodies. One of the claims, if not the greatest claim, made for the cyclecar is that its seating accommodation is side by side, yet what do we see on the road? Passengers seated side by side in bodies barely wide enough for one bulky person. A body of this type gives the impression that the passengers have been pushed down into the seat and what would not go in had bulged over the side. If we are to have cyclecars in any numbers let us, at least, have comfortable roomy bodies.

Then with regard to sidecars, although there are a number of excellently designed and well-made sidecar frames on the market there are comparatively few convenient bodies. We refer particularly to accommodation for the multiplicity of traps which one finds it necessary to carry in the case of passenger motor cycling. We ask, where is the sidecar body made which can be entered and left as quickly as a motor car? Why should a sidecar passenger be incommoded by the driver's oilskin, overalls, and other sundries which will never go into a little locker such as is fitted to most sidecars. In addition, the said locker is usually under the passenger's seat, and every time anything is required the passenger must, of course, be disturbed. Every sidecar should have a locker or "boot" fitted, say at the back of the seat.

## The Cape Peninsula M.C.C. 100 Mile Trial.

**T**HE King's birthday brought King's weather—a perfect dry winter day—to the twenty-seven starters. The route was as follows: Salt River to Eerste River (control) 22 miles, Eerste River, *via* Somerset Strand and Gordon's Bay, to Sir Lowry Pass (control) 19 miles, Sir Lowry Pass, *via* Somerset West, to Stellenbosch (control and luncheon stop) 17 miles, Stellenbosch, *via* Bottelary Farm, to Bellville (control) 17 miles, Bellville, *via* Durbanville and Maitland, back to Salt River, 25 miles, total 100 miles.

Results: Time error. Stops. Total.

1. S. B. Priston (P. and M.) — ... 10 ... 10
2. H. Dreyer (6 Enfield sc.) ... 2 ... 10 ... 12
3. R. H. M. Hill (Ariel) ... 10 ... 10 ... 20

The Eerste River control was much further placed than competitors anticipated, resulting in many of them arriving late, only Rev. S. B. Priston (P. and M.) managed the right time, while on the other hand Vincent Lee (7 Indian sc.), who carried two passengers in the sidecar and one on the carrier, erred ten minutes.

The road had dried up very quickly after the heavy winter rains of late, but was free from dust—a real blessing.

Some of the competitors arriving at the second control at Sir Lowry Pass had made up time, thus preventing additional loss of marks, and they now hurried to

the water splash. C. Des Forges (Calthorpe sc.) dropped his passenger, while H. M. Hill (Ariel), and many others after safely negotiating the 12in. deep rivulet, came to a stop on reaching the other side, in most cases the water having fouled magneto or sparking plug.

A four-mile down grade stretch of road, bordered by stately trees, led through the village of Somerset West and up the hill leading into the main road, the severity of which caused a stop to R. Lee (2½ Humber).

On the long rise to Stellenbosch J. Thornton (Bradbury sc.) had to run alongside on the 1 in 5 gradient of Red Hill, while W. H. Logeman (Humber sc.), after tightening his Whittle belt, forthwith made up lost time.

The *pièce de résistance* of the day was the long climb over a rough and uneven road leading past Mr. van Niekerk's farm, Vissershok, on to the Koeberg Road.

Hereabouts the Rev. S. B. Priston met with his first stop, the bottom part of his front mudguard having come in contact with a boulder, thus upsetting the rider's balance.

H. Dreyer (6 Enfield and sc.) went merrily along, his passenger making good use of a whip in chasing cattle desirous of disputing the right of way. F. H. Fritchley (P. and M.) was the only competitor to make an absolute non-stop run.

1.—The Rev. S. B. Priston (2½ h.p. P. & M.), winner of the 100 miles contest. 2.—The luncheon stop at Stellenbosch. The scene outside the Ma-onic Hall. 3.—Perkins (Triumph) entering from the Gordon's Bay road into the mountain road for Sir Lowry Pass. The fine scenery in these parts will be noted. 4.—Vincent Lee (7 h.p. Ind an sidecar), who went through the 100 miles run with three extra passengers as shown. 5.—J. Thornton (3½ Bradbury—Canelet sidecar) leaving Stellenbosch.

## The Moral of Porlock.

I suppose one may now say without contradiction that the A.C.U. Trials were sent up Porlock Hill under conditions that made a "clean" ascent half a fluke and half a matter of jockeyship, simply to settle the awards for the special prizes. Several teams and several individuals were standing equal for the special cups and medals, and the judges saw no other means of differentiating between them, if they were not sent up a hill which was absolutely certain to knock some of the leaders out. On all other grounds it was undesirable to send the men up Porlock. Any machine, from a  $3\frac{1}{2}$  h.p. solo with 15 to 1 bottom gear to an 8 h.p. sidecar outfit with 12 to 1 bottom gear, could fail on the hill without sustaining the faintest technical slur. Success or failure depended almost exclusively on the skill of the driver—with some slight element of luck included. All over England people are talking vaguely of the "shocking exhibition" the Trials gave on the hill, and most of the critics are unaware that practically the entire entry would have romped up the hill on a dry day, and that the road conditions were so impossible that the hill could be fairly described as unrideable. Slithering over eight inches of mud with one's feet out on a double figure gear is not motor cycling—it is knockabout gymkhana comedy. Nothing but the need of awarding the special prizes to one team and one or two individuals could have justified its inclusion.

## Methods of Awarding Special Prizes.

Now I hope this point will be kept in mind for next year's Trials, and that similar impolitic fiascos will be avoided by wiser regulations. Is it sensible or necessary to award special prizes to teams or individuals? With all respect to the successful holders of such awards in this or previous years, no practical rider imagines that a yawning chasm of profound superiority separates these special prize winners from the bulk of the gold medallists. The jockeys may be fractionally cleverer or more experienced; more complete precautions may have been observed by the entrants in the way of equipping the machines for their special task, or of acquainting the riders with the worst parts of the route; the capricious goddess luck (especially tyre-luck) may have specially favoured the victors, and so on. But actually their superiority is neither so tremendous nor so absolutely an intrinsic feature of the machine as to require or justify differentiation. I personally consider it would be closer to the facts, and fairer to the riders and to the trade, to stiffen the awards a trifle, and, for instance, confine first class gold medals to such machines and teams as lose no marks at all, and to award second class gold medals to machines securing, say, 95%. If the powers that be differ from me, and fancy they can verify the best individual combination and the best team, is a basis of trick-riding on freak gears the wisest method of making the award? Why not, for instance, take into consideration the condition of the exhaust valve, the amount of carbon deposit, or

other really technical and practical factors? There is a smaller chance of error in a team award, though I think the time has come when a team should consist of more than three machines; but I never attach huge importance to special single rider awards; for instance, in the 1912 Trials I know of more than one stoppage on quite insignificant hills by machines which secured special awards, which incurred no penalty because no official happened to be at hand. If special awards are persisted in, riding skill may fairly be made a factor in amateur prizes; but in trade awards the public interest centres on the machine, not on the rider, and the personal equation should, therefore, be eliminated.

## A Warning about Cyclecars.

I should like to remind country buyers of cyclecars that they must not corner on these light vehicles as daringly as they would on a small car weighing from ten to fifteen hundredweight. In corner work a cyclecar resembles a sidecar; it may have its wheelbase and weight distribution so arranged as to give more balance than the average sidecar affords, but it requires full use to be made of the occupants' weight if any daring corner work is attempted. The man who tries to rush sharp corners on a three or four-wheeled cyclecar with himself and his (fair?) passenger leaning haughtily backwards is asking for trouble. "Weatherilting," as somebody calls it, is essential.

## Two Defects of some Repair Outfits.

I am surprised to find that many repair outfits lack two items which experience leads me to regard as no less vital than patches and solution—I refer to valve tubing and a small gaiter. I bought two repair outfits on tour the other week, both bearing very famous trade marks. One contained no spare valve rubber, and the other was destitute of any materials suitable for patching or protecting a gash in the cover.

Quickly detachable wheels are a feature of the Lea-Francis, the first details of which appeared in our last issue. It will be seen that when a wheel is removed the driving chains and cases are left in situ.

## The Rotherham Pilot Jet Carburetter.

A NEW pilot jet carburetter for motor cycles will shortly be introduced by Rotherham and Sons, Coventry. It is fitted with an adjustable main jet, which has an indicator by means of which the settings may be accurately checked. The throttle and air controls are of the barrel type, and lie side by side, both being actuated by Bowden wires from the handle-bar. A branch pipe fitted just below the main jet feeds a pilot jet placed on the engine side of the carburetter. The bore of this jet is only .009, and it lies in a small choke tube, the air intake to which is adjustable by means of a screwed sleeve. This may be made to uncover ports in the side of the choke tube. The setting should be such that when the throttle is fully closed the engine will just turn over slowly. On the day of our visit we were unable to have a demonstration of the carburetter in actual use, but have been promised a trial in the near future. We are looking forward to this with some interest, as the carburetter appears capable of very fine adjustment. The carburetter is designed so that any part which might need attention is accessible, though there appears to be very little possibility of trouble. The float chamber is fitted with a neat spring clip lid, and the whole is finished in dull plating.

Details of the adjustable jet on the Rotherham carburetter.

New Rotherham pilot jet carburetter.

## The Latest Dew Spider Quad.

THE neat four-wheeler illustrated on this page has recently been built by H. E. Dew, of Eynsford, Kent, according to his own design.

In the general outline it follows the pattern of its predecessor, the  $3\frac{1}{2}$  h.p. J.A.P.-engined cyclecar, which, it will be remembered, was described and illustrated in our issue of October 12th, 1911. The latter machine was fitted with double belt drive from the counter-shaft to back axle, while the present one has chain transmission throughout, and several other alterations and improvements have been made.

Describing it from front to rear, its salient points are three-point suspension, sprung fore part, the rear being quite rigid. The power is supplied by a 6 h.p. Blumfield twin engine (65 mm. bore  $\times$  95 mm. stroke), fitted into adjustable engine brackets, so that the engine may be moved either forward or backward for chain adjustment. The carburetter is an Amac, and

the magneto a Bosch. A metal-to-metal clutch and two-speed gear box (giving gears of  $4\frac{1}{2}$  to 1 on top and 8 to 1 on low) are mounted on the counter-shaft, which is held on ball races in a sliding frame, the sliding movement allowing for the adjustment of rear chain.

Two foot-operated band brakes are fitted to the rear wheels, which in turn are shod with Michelin steel-studded non-skid tyres, those on the front wheels being of the Clincher grooved pattern.

The finished model is covered in with thin sheet steel. In the illustration, however, these shields have been removed, so that the general outline may be more clearly observed.

Mr. Dew informs us that it has been designed for fast Colonial work, but before despatching it we understand that he will make an attempt to lower the cyclecar hour record.

Three aspects of the latest Dew spider quad described above.

## The latest Wall Auto-Wheel.

Messrs. the International Auto-wheel Co., Ltd., Russell Garage, Russell Road, Kensington, W., have taken up the sole agency of the Wall Auto-wheel, which is now manufactured to their designs.

The power unit consists of a 1 h.p. four-cycle engine, 52 x 54 mm., attached to a frame supporting one wheel. The crank case casting comprises an oil tank and a platform for the magneto. The oil tank is arranged on the bird fountain principle, which means that a constant level is maintained in the crank case until the reservoir is empty. The magneto is gear driven, and the camshaft is geared 4 to 1 to the main shaft, there being two cams instead of one, so that the timing is not affected. To the end of the camshaft there is attached a sprocket, connected by a chain to another sprocket on the cycle wheel spindle. The inlet valve is automatic. A special carburetter is fitted, which is supplied with a single lever control. There is one sleeve in the vaporising chamber which uncovers the air and gas orifices at the same moment and in the correct proportion. Both the cam and main shafts run in ball bearings.

The unit is attached to the cycle in the following manner: There is a stay attached by clips to the back forks of the bicycle, to the chain stays and the rear spindle, thus forming a strong three-point attachment. The unit is bolted to the horizontal member of this bracket so that it is free to rise up and down with the

Side and rear views of the improved Wall wheel.

inequalities of the road. The carburetter control and the exhaust valve lifter are carried on the handle-bar.

The device is not intended for serious touring, but it is said to be capable of negotiating a hill of about 1 in 16.

## HAND STARTING DEVICE FOR FOUR-CYLINDER ENGINES.

We have lately had the opportunity of inspecting an ingenious and simple device for starting four-cylinder motor cycles, invented by Mr. W. A. Halls-worth. It consists

A. Frame members. B. Flywheel. C. Case. D. Flexible wire.

This case is fixed beneath the flywheel, round which the wire is lapped once before being brought out through a hole in the flywheel cover. The wire is provided with a stop, which answers the double purpose of preventing it from being drawn too far in by the spring or too far out when being pulled to start the engine. When the spring has returned the wire as far as possible, and the handle ring is pushed into the clip provided on the flywheel cover, the wire encircles the flywheel loosely and drops back from contact with it into the guide

provided. Our illustration shows a rider in the act of starting his engine, a four-cylinder F.N., the wire being drawn out about half-way. The device is most

Starting the engine by means of a wire and loop.

effective. We saw the engine started several times, a single pull being sufficient in each case. The start can be affected from the saddle if desired.

### A Neat Accessory.

A smart oilskin cap cover has been sent us by the Para Rubber Co., 93, John Bright Street, Birmingham. It is

very light but thoroughly protects the head. When folded it will go into a coat pocket. These covers were used by some of the riders in the Six Days' Trials, and they are bound to appeal to all weather tourists.

#### A New Sidecar Lamp.

Brown Bros., Ltd., of Great Eastern Street, London, are marketing a neat oil side lamp for sidecars. The lamp may be had in brass or nickel finish, and with fixing for bracket on either side.

It is strongly made, and the fastenings are substantial, which is of great importance to sidecarists. In view of our leading articles urging sidecarists to show the extreme width of their vehicles, and

the general agreement with this advice, this accessory should be in strong demand.

#### A Sidecar Wind Screen.

A very neatly manufactured wind screen, for use on sidecars, has lately been placed on the market by Messrs.

C. and W. Bluemel Bros., Wolston, near Coventry. The screen is made of transparent celluloid and is carried by special brackets mounted on the sidecar body. These brackets are arranged so that they do not interfere with the entrance

to the body, and so that the screen may be set at the most convenient and effective angle. A waterproof apron attached to the lower part effectually prevents any wind or rain passing under the screen. Instructions for correct fitting are supplied with each article.

#### Tyre Solution Flask.

The Coro Oil and Rubber Company, Ltd., St. Paul's Square, Birmingham, have introduced a very useful and practical flask for containing rubber solution. It is made of well polished plated brass, and to the stopper is attached a brush. This is by far the most practical means of carrying the solution, as it keeps in good condition, and the case cannot be damaged like lead collapsible tubes.

#### Burelto Sidecar Stand.

The accompanying sketch shows an ingenious sidecar stand patented by Mr. Eltoft, and manufactured by A. B. Burton and Co., Ltd., Hale, Cheshire. It may be clipped on to the frame of the sidecar and slid along the frame tube or axle so as to form a stand for the sidecar wheel or a rest for the cycle end of the axle when the sidecar is detached. A small rubber-tyred wheel is fitted to the bottom, and it may be fixed at any height or any angle by means of thumb nuts.

#### Six Days' Trials Notes.

Douglas riders won three gold medals in the Six Days' Trials, Messrs. Moffatt, Gibb, and Fletcher receiving the maximum award.

The 3½ h.p. Premier, ridden by Mr. W. B. Little, who won *The Motor Cycle* private owners' cup, was equipped with Stelastatic tyres, which gave every satisfaction. Mr. Dickson (7 h.p. Indian) also used the new Stelastatic tyre with every success, neither of these riders having occasion to use their inflators.

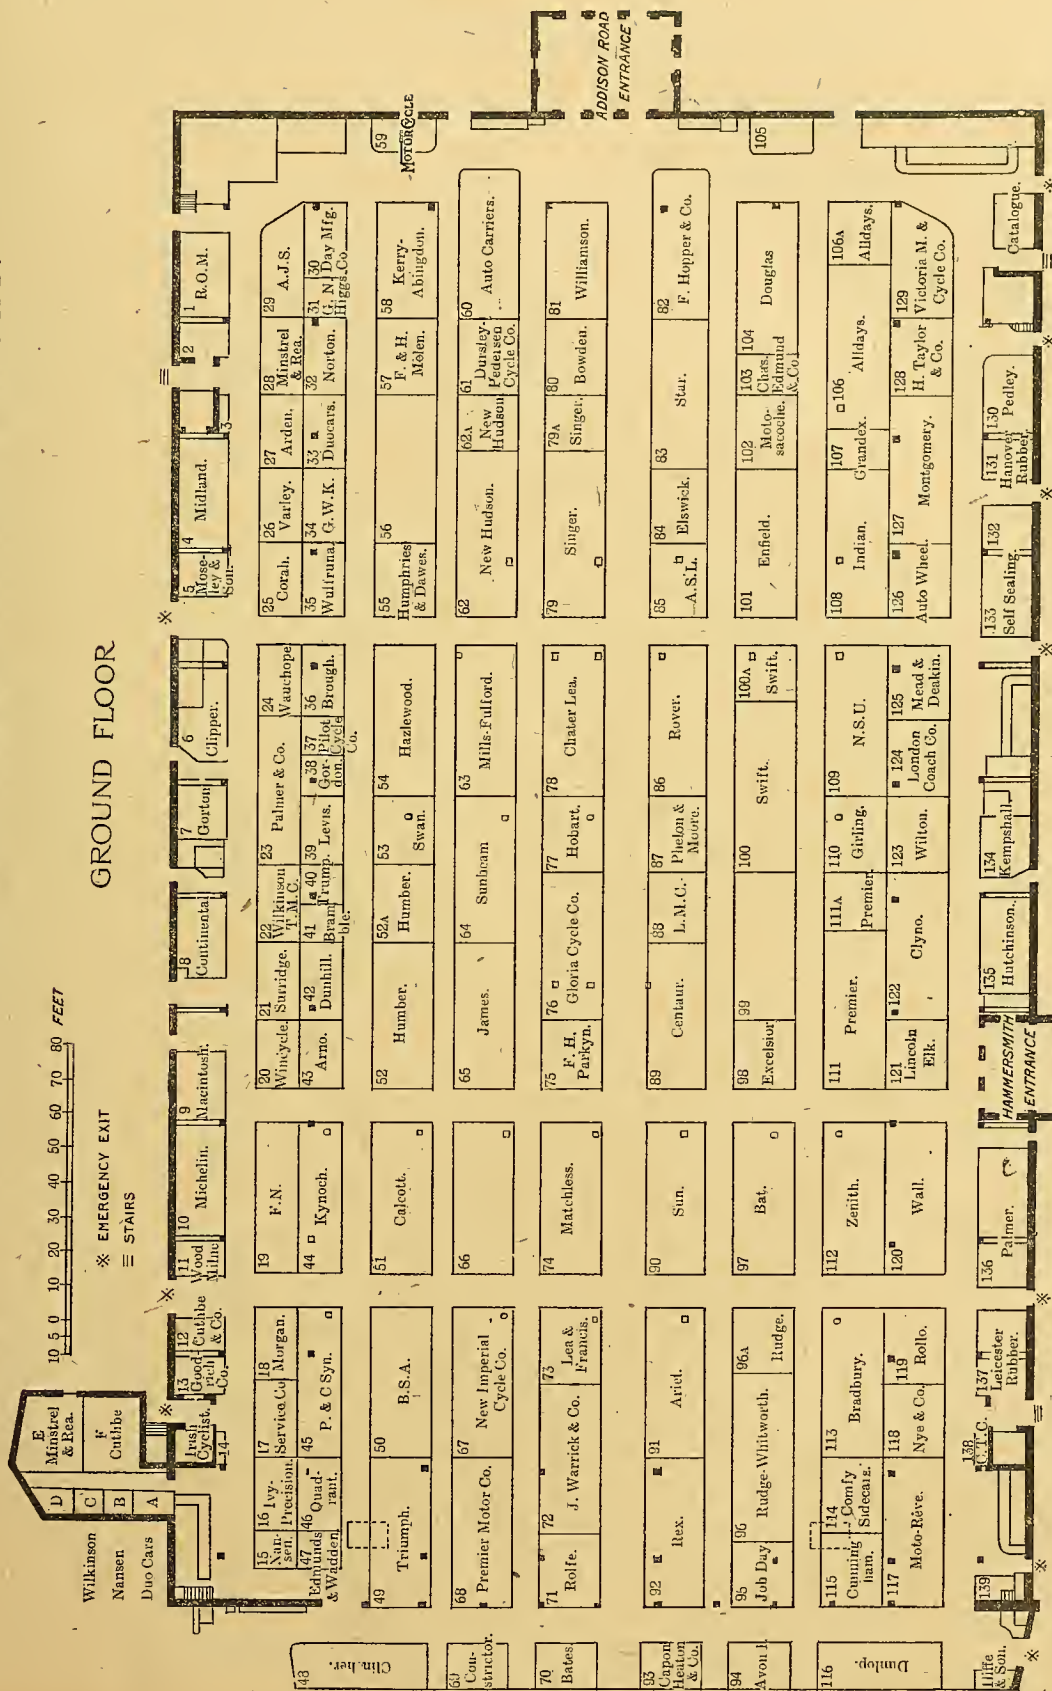

The latest Wall auto-wheel, described on another page of this issue. A four-cycle engine is now used.

From Monday, November 25th, to Saturday, November 30th.

## SHOWING POSITIONS ALLOTTED TO EXHIBITORS.

We reproduce above the Olympia Show plan showing positions of exhibitors. A somewhat novel arrangement of the stands will be made at this year's Olympia Motor Cycle Show. All exhibitors will be in the Main Hall and the tyre manufacturers will have stands round the sides. There will be no offices except in the Annexe, which will be entirely filled with them. This arrangement should be a great help to visitors, as it will enable any particular stand to be located with ease.

# Record Breaking at Canning Town.

In last week's issue, we gave some details of records annexed by Harry Martin, riding a 2½ h.p. Martin-Jap (85.5×39.5 mm.) He used the track on which so many motor cycle events were lost and won in the early days, probably for the last time. His machine was the same he used in the last B.A.R.C. meeting, being fitted with a Rotherham pressure-fed lubricator, and the exhaust-controlled forced induction to which reference has already been made in these pages. The day was fine, and there was practically no wind. His first attempt was the standing mile, which he easily obtained. Next he had a try for the standing five miles, which likewise fell to his machine. Finally, he made an attempt on the ten miles, but as he changed the pulley which gave him rather too high a gear, and the smaller one threw the belt rather out of line and caused it to twist

over, he had to give up. Despite these troubles Martin also captured the six miles record standing start. On his second attempt something in his eye caused him to stop.

## New records.

H. Martin (2½ Martin-Jap), Aug. 27th, 1912.

## Old records.

C. E. Bennett (2½ Mansfield), Aug. 10th, 1897.

1 mile	..	1m. 14½s. = 48.12 m.p.h.	1m. 16½s.
2 miles	...	2m. 19½s.	2m. 21s.
3	..	3m. 23s.	3m. 26½s.
4	..	4m. 27½s. = 54.21 m.p.h.	4m. 32½s.
5	..	5m. 32s.	5m. 40½s.
6	..	6m. 39½s.	6m. 47½s.

Martin used C.A.V. accumulator, Pratt's spirit, Wakefield oil, Dunlop belt, Continental tyres, and Amac carburetter.

1.—Start of the five miles record attempt. 2 & 3.—At full speed on the banking. 4.—Replenishing the fuel tank.

# A.C.U. Six Days' Reliability Trial.

## JUDGES' REPORT (Abridged).

**T**HIS year's Six Days' Trial was held under very bad weather conditions, which undoubtedly enhanced the value of the trial as a test of machines. The routes selected proved to be of a most varied nature, and fulfilled admirably the object for which they were chosen. Treating two of the steepest hills as "bonus hills," not involving the usual penalty of 50 marks, appears in the light of the final results to have been a mistake. The West Country, abounding in steep hills, sharp corners, and indifferent road surface, did not in fact prove severe enough to weed out more than 30 per cent. of the entrants, over 70 per cent. of those who completed the trial earning medals. Certain of the observed hills were not chosen on account of their steepness alone, and yet caused the failure of several whose machines were capable of climbing more severe gradients. The inclusion of such hills is most desirable, but in future competitors should be informed by means of a flag or otherwise where they officially commence and finish. The trial, in spite of the weather, was a great success, and the local enthusiasm shown in all towns and villages traversed was a most gratifying feature.

The system of running to a speed of 20 m.p.h. with ten minutes latitude early or late of exact schedule time at any point of the route (not disclosed to the competitors) worked satisfactorily. No excessive speeds on the road were observed, and the longest time available for an adjustment or repair without risk of losing marks was less than twenty minutes. This system had probably also the effect of making the trial less severe in one respect than last year's trial, when the regulations permitted the competitors to arrive just outside the known checking stations as early as they pleased. Whatever may have been the cause, the condition of the machines at the end of this trial was in general appreciably better than at the end of last year's trial.

The system adopted this year of starting the competitors at minute intervals, although tedious to the officials, successfully prevented "bunching" and traffic stops, and facilitated the arrangements at the various controls.

In the provisional results issued at Taunton, the cup offered by Colonel Boles for the best performance by a private owner driving a solo machine on the observed hills, and the cup offered by the proprietors of *The Motor Cycle* for the best performance throughout the trial by a private owner driving a solo machine, were credited to W. G. McMinnies. Mr. McMinnies has explained that at the time of the trial he was not the *bona fide* owner of the machine which he rode, and has spontaneously waived any right he may have had to any special award.

Another case to which the judges would draw attention is that of H. Mellor Jameson (Enfield sc.). Mr. Jameson earned the maximum number of marks and would have been awarded two of the special prizes had he not incurred disqualification by a breach of the rule as to assistance.

### Transmission.

The condition of the machines at the conclusion of the trial was, as stated above, excellent. The behaviour of the various types of gear during the trial is most instructive. The comparatively simple variable pulley type of gear was represented by the Gradua, which won two gold medals out of five starters, and the Rudge Multi which won two gold medals out of six starters. The judges are of opinion that this form of gear, whilst excellent for general purposes, does not provide a sufficiently low emergency ratio, the lowest ratio obtainable being in the neighbourhood of 8 to 1, and this only at the risk of unfair treatment of the belt in passing over the small engine pulley.

Epicyclic gears were fitted to many machines.

Comparing the two most popular types of hub gears, we find that the Armstrong hub runs solid on its middle gear, whilst the Sturmey-Archer runs solid on its high gear. Presuming the ratios between the three gears are the same in both hubs, it follows that with the Armstrong gear a smaller engine pulley must be employed to obtain as low a gear as is possible with the Sturmey-Archer, with greater risk of belt slip. On the other hand, the reduction when in bottom gear is performed through one epicyclic train in the case of the Armstrong hub against two trains in the Sturmey-Archer hub, with less frictional loss.

The V.S. gear, fitted to the Matchless machines, gives a direct drive on top and fifty per cent. reduction on the low gear. The necessity for an intermediate ratio must often be felt on these machines, although the gear as fitted appeared easy of manipulation and adjustment.

Counter-shaft gears were fitted to sixteen machines. Here the whole transmission is very simple, and the performance of this type of gear generally throughout the trials leaves the judges no room to doubt its ultimate success over other types. Besides the advantage of the wide range of gear ratios obtainable and the better distribution of weight, the counter-shaft gear possesses the important advantage of leaving the back wheel free from complications and the back tyre easy of access. The quickly detachable wheel is rendered a more feasible proposition. The carrying of a spare wheel by passenger machines should be encouraged in future trials.

### Engines.

With one exception no serious trouble was recorded. It is to be regretted that no representative of the 500 c.c. twin-cylinder type of engine was entered for the trial. This type of engine, with a suitable variable gear, would seem ideal for a solo machine and occasional use with a sidecar.

### Ball Bearings.

The hub bearings and steering heads of many machines were in perfect condition at the end of the trial, with no appreciable side shake. But almost as many machines left much to be desired in this respect.

### Brakes.

The fact that all the machines safely negotiated the many steep descents included in the trial shows that the brakes in general were efficient. In the opinion of the judges, however, the method of applying the brake is in general open to criticism. Foot brake pedals are not nearly stout enough or large enough. The adjustment of the foot brake is a further detail that requires improvement. Front wheel brakes as at present fitted are, in general, practically useless, the pressure applied by the hand being too feeble to produce much retardation of the machine. The fault can be remedied in two ways. Either the leverage should be increased, giving necessarily a longer range to the movement of the lever, or the method of mounting the brake shoes should be modified. As at present fitted the front wheel brake blocks approach the rim at right angles to the surface. The fitting should be so designed that the blocks approach the rim at an acute angle, say 45 degrees with the direction of the rim's motion. This gives a self-applying action to the brake, so that a light hand pressure effects a great pressure between the block and rim. When slotted guides are used they should slope upward and forward instead of being parallel to the fork. If pivoted links are used the ends secured to the forks should be much higher up than the brake shoes.

### Protection of Machine and Rider.

Once again the judges have to call attention to the fact that the mudguards, as a rule, do not give adequate protection to the machine and rider. The Scott machines, with their footboards and sloping shields, are notable exceptions. Some failures were reported due to the so-called waterproof magneto becoming water-logged. Manufacturers of motor cycles must evidently not place too much reliance on the magneto being, in itself, waterproof, but must still provide adequate protection.

### Cyclecars.

The employment of friction drive in the G.W.K. machines is worthy of note as having proved quite satisfactory under certain conditions, in spite of the doubts commonly expressed as to the practical efficiency of this means of variable transmission. The excessively long belts used on such machines as the Duocar would appear to be a likely source of trouble, owing to the tendency under certain road and driving conditions towards undue oscillation and possible twisting of the belts. Many sidecars and tricars apparently suffered from lack of sufficient weight on the driving wheel.

Judges } E. PERCY GREENHILL,  
D. F. NIGHOLL, Major R.A.  
ARCHIBALD SHARP.

## A.C.U. Six Days' Trials: Amended List of Awards.

THE meeting of the judges last week confirmed the following awards:

The private owners' team prize, offered by His Worship the Mayor of Taunton, Alderman W. F. Whittingham, for the best performance of a team of three private owners, who were nominated by and were members of an affiliated club, was awarded to the Woolwich and Plumstead team, composed of Messrs. Nott, Tassel, and Guest, all driving Matchless sidecar combinations. The original rule stipulated that at least five teams should be nominated. His Worship the Mayor, however, was pleased to award the prize notwithstanding the fact that only three teams entered.

The following competitors who, in the preliminary announcements, were down as having been awarded silver medals were awarded gold medals: A. E. Catt (3½ h.p. Triumph) and W. B. Gibb (2¾ h.p. Douglas).

The judges carefully considered the case of G. L. Fletcher, and came to the conclusion that sand was maliciously put into his engine by some evilly disposed person. He is therefore credited with all the marks he lost on the last day of the Trial, and is awarded a gold medal. The A.C.U. is offering a reward of £10 for any information which will lead to the detection of the originator of this dastardly act.

The case of H. Mellor Jameson (6 h.p. Enfield sidecar) was discussed, and it was decided that, owing to his being guilty of a technical breach of the rules (his passenger assisted him), he was ineligible for

*The Motor Cycle* Cup for the best performance throughout the Trial by a private owner driving a passenger machine. The judges, however, are fully aware of the fact that he put up a most creditable performance.

### The Private Owner Awards.

The prize offered for the best performance by a private owner driving a solo machine on the observed hills, presented by the president of the Taunton and District M.C.C., Col. D. F. Boles, J.P., M.F.H., was awarded to J. D. Corke (5 h.p. A.J.S.)

The cup offered by Mr. T. S. Penney, J.P., for the best performance of a private owner on the observed hill was awarded to R. E. Guest (8 h.p. Matchless sidecar).

The silver cup offered by the proprietors of *The Motor Cycle* for the best performance throughout the Trial for a private owner driving a passenger machine was awarded to R. E. Guest (8 h.p. Matchless).

The silver cup offered by the proprietors of *The Motor Cycle* for the best performance of a private owner driving a solo machine was awarded to W. B. Little (3½ h.p. Premier).

The gold medal awarded to the rider who climbed Porlock Hill and did not qualify for any other award was granted to V. Wilberforce (2¾ h.p. Douglas).

W. G. McMinnies, whose name figures in the preliminary list of awards, did not come under the "private owner" definition, the two-speed Triumph he rode not being his own property.

## Another New Cyclecar.

WE had the opportunity the other day of inspecting at the works of Messrs. Godfrey and Nash at Hendon the latest model of the G.N. cyclecar, previous models of which have already been described in *The Motor Cycle* pages, and it will therefore suffice if we deal with the new features of the present model, and refer our readers to the previous descriptions for the general arrangement details.

The twin-cylinder engine fitted to the G.N. cyclecar. The points to be noticed are the overhead inlet valves, cooling fan driven by flywheel, and cylinders set at 90 degrees.

In the first place the firm are employing an air-cooled V type engine of their own manufacture, 80 x 98 mm. bore and stroke. A large outside flywheel 14½ in. in diameter is employed, and to this is due the remarkable capacity of the engine to run steadily at slow speeds.

A feature of the engine is the 5½ in. white metal bearing between the crank and the flywheel.

Brown and Barlow carburetter and Eisemann high-tension magneto are fitted. From the engine a roller chain transmits the drive to the clutchshaft. The

clutch is of the gripping variety, friction being obtained by the contact of metal with two discs of Ferodo. From the clutchshaft two chains take the drive to the counter-shaft, and a simple arrangement of dogs enables either of these to be operated at will. At each end of this counter-shaft belt pulleys are fitted to accommodate rim. Lyso belts, which transmit the power to the rear wheels. The clutchshaft, it may

Broadside view of the new G.N. cyclecar.

be added, is really hollow, rotating on a steel spindle. Both hand and foot brakes act on the same shoes, which press internally on the belt rim, the rocker-shaft of which is carried on the top of the neatly designed radius rods. Ackerman steering is employed, controlled by wire cables fixed to a drum on the lower end of the steering column.

# LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

## Chain v. Belt Drive.

Sir,—Are not the makers and upholders of the belt-cum-chain drive overlooking one point, and that is belt speed. Now the faster a belt runs up to about 4,000 feet per minute, the more power it will transmit; beyond this region centrifugal force counteracts the advantage gained by speed, and the belt must be too tight to last long. A great many of these machines are being run with a sidecar, and it is interesting to take the case of a sidecar going up a hill at 15 m.p.h., "all out," on bottom gear. Here we have the machine moving at 22ft. per second, and, taking the wheel diameter as 26in. and the belt rim at 20in., we have a belt speed of  $\frac{20 \times 22}{26} = 17\text{ft. per second or } 1,020\text{ft. per minute. Compare}$

this with running a solo on the high gear (with the engine developing the same power), say, at 48 m.p.h., when the belt is running at a speed of  $\frac{48 \times 88 \times 20}{60 \times 26} = 54\text{ft. per second or } 3,240\text{ft. per minute, which is about the most efficient speed.}$

In the case of a geared hub, exactly the reverse is the case, as here we have the lower the gear, the higher the belt speed for a given rate at which the machine is travelling. I should like to hear some makers' and also users' opinions and experiences on this point. Theoretically the geared hub should cause much less wear on the belt than the counter-shaft gear, but as the motor bicycle is one of those cases in which practice upsets theory I should not be in the least surprised to hear that I am entirely wrong. C.P.A.

Sir,—I was greatly interested by "Ixion's" vigorous defence of belt drive in your issue of August 22nd. Now I have owned four motor bicycles, all belt-driven, and every belt I use gives me more trouble than its predecessor. I have just returned from a holiday in Anglesey, when I was accompanied by a friend. We both rode  $3\frac{1}{2}$  h.p. belt-driven machines. My friend's was a brand new rubber canvas belt; mine had seen some hundreds of miles usage, but should have lasted me throughout the trip without giving much trouble. We went from Bournemouth to Anglesey without trouble, then came the deluge.

First day (ninety miles).—My belt broke once; the fastener broke once; my friend's belt broke twice.

Second day (sixty-four miles).—My friend's broke once; mine stretched and had to be shortened.

Third day.—My friend broke a belt fastener; I had to shorten mine.

Fourth day (140 miles).—I put on my spare belt and we had no trouble beyond the belt coming off twice, although it was quite tight. This was due to using a badly designed fastener.

Fifth day (170 miles).—My belt broke twice, when I changed to the original belt which broke three times. My friend's belt collapsed altogether and literally fell to pieces, he being obliged to buy a new one twenty miles from home. Our belts were of well-known and much advertised makes costing over a guinea each.

Has "Ixion" ever thought of the cost of belt drive? Under the most favourable circumstances it costs me between 1s. and 1s. 6d. per hundred miles, and in the case of my friend's belt it cost him over 2s. a hundred. This is as much as it costs in petrol and oil, and, in addition, I get a free engine up hill when I am caught in a heavy storm.

Would any cyclist or car driver be content with such a transmission system? Unfortunately the choice of chain-driven machines is small, and unless something fresh appears at this year's show, I shall be obliged to purchase another belt-driven machine for next year; but I shall still regard the belt as a very poor makeshift and a blot upon the fine piece of mechanism which the modern motor bicycle undoubtedly is. E. K. WYATT.

## Tyres.

Sir,—With the modern motor cycle in ordinary usage mechanical breakdowns are practically non-existent. But, oh, the tyres! Why tyre makers cannot make a tyre they can safely guarantee holeproof for at least one season I cannot understand. In these days of good engines, none but the speed merchant, pure and simple, or road hog need worry about two or three pounds extra weight in the tyres. Strong special (?) tyres as at present made seem good enough for the front wheel, but for the driving wheel of even  $3\frac{1}{2}$  h.p. machines with sidecar they should be at least twice as thick on the treads and tapering to the beads. My experience of specially heavy tyres for sidecar work with high-powered machines as at present made is that they are only from  $\frac{1}{4}$  in. to  $\frac{3}{8}$  in. thick between the studs, and after from 600 to 1,000 miles with sidecar they are only fit for the scrap-heap. My idea is four-ply, two extra plies along tread, and a third going halfway round, making a seven-ply tread, and all well embedded in rubber; or why not line present tyres like the Le Paris Club Cuirasse pushbike tyre? Thousands I am sure, like myself, are willing to pay for the right article. You do not half grind it in enough about tyre failures in the various competitions, trials, etc. Oh for a good strong tyre!

ONE IN THE GREAT ARMY OF ROADSIDE SOLUTIONERS.

W. Simpson, of Newcastle-on-Tyne, with his  $3\frac{1}{2}$  h.p. Lincoln Elk-gondola sidecar combination. The Lincoln Elk double drive two-speed gear (belt for high gear and chain for low gear) is fitted, and the sidecar is the touring gondola. We are told that both machine and sidecar are giving every satisfaction. The gear ratios adopted are 5 and 10 to 1.

### A Novel Sidecar.

Sir,—Re your reference, on page 963 of *The Motor Cycle* of August 22nd, regarding an enormous sidecar resembling a giant vegetable marrow, it may be of interest to horticulturists, to know that this vegetable, of which I am the grower, was grown from three ply seed during this extremely wet season, and notwithstanding the adverse climatic conditions, attained the weight of 65 lbs.—not a bad record considering that the artificial manure consisted mainly of glue. Should Messrs. Sutton's Seeds, of Reading, be interested in abnormal vegetables, they may procure seeds from me which will be guaranteed to grow in like proportion at the modest cost of £12 12s. per seed. CHAS. WAKEMAN.

### A Problem that Baffled.

Sir,—In reference to the article that appeared some time ago in *The Motor Cycle* upon petrol consumption of the motor cycle compared with the motor car, I send you the following notes:

The head resistance (windage) of a motor cyclist and machine is assessable at six square feet.

You will remember Col. R. E. Crompton in *The Cyclist* measured his own and pedicycle resistance at  $5\frac{1}{2}$  square feet. But he is tall, and the average pedicyclist with machine will not measure so much, say,  $4\frac{1}{2}$  square feet. Then allow  $1\frac{1}{2}$  feet more to cover the extra head presentment of motor cycle and we get 6 square feet.

We then make the statements:

Motor cycle, 3 cwt. load, has 6 feet head resistance, and

Motor car, 30 cwt. load, has 30 feet head resistance, thus

Motor cycle for every load-unit meets two windage-units, and

Motor car for every load-unit meets one windage-unit.

So

Motor cycle, three load-units  $\times$  two windage-units = six load windage units.

Motor car, thirty load-units  $\times$  one windage-unit = thirty load-windage units.

Load windages (six to thirty) are as one to five, which equal the petrol consumption one to five gallons.

ELUCIDATOR.

### A Sociable Tricar.

Sir,—I am sending you photographs and particulars of a sporting type tricar, which I have built throughout for my own use. The engine is a twin-cylinder,  $101\frac{1}{2}$  mm. bore, 130 mm. stroke, air-cooled, set at  $80^\circ$ , magneto ignition, with accumulator and trembler coil to one cylinder for easy starting. The drive is by V belt over expanding pulley and hinged back wheel, to tighten belt, giving any gears from  $4\frac{1}{2}$  to  $2\frac{1}{2}$  to 1, the operations being independent, and either giving a smooth start. The belt is of strong proofed canvas, to which are fixed fibre blocks. The machine is fitted with electric lamps and magneto dynamo. The weight is 6 cwt.

It was driven from Stirchley, Birmingham, to Brooklands on July 20th with one cylinder removed to compete in the All-comers' Handicap. It runs just over thirty miles per gallon; distance run, quite 3,000 miles. I have just put on a new belt, but the old one is not worn out. It climbs Sunrising Hill on a  $3\frac{3}{4}$  to 1 gear.

I have been obliged to refuse orders owing to present inability to promise date of delivery. If any of your readers are interested in furthering the construction of this type of cyclecar, I shall be pleased to communicate with them.

S. CARTER.

### Decompressors.

Sir,—I have read with interest the excellent article on decompressors which appeared in the issue of August 15th, but looked in vain for mention of the Endrick decompressor. This device I have recently purchased and fitted to a  $3\frac{1}{2}$  h.p. of well-known make and find that it entirely removes the starting difficulty, and though the machine is fitted with a clutch, I have, since fitting the decompressor, taken to starting with a push; it is also invaluable in many other ways, such as starting up on the stand, etc., and, taking into consideration its low price and simplicity, it is, in my opinion, one of the accessories which supply the many long-felt wants of motor cyclists. I have no interest in the manufacture of this article, but speak as a satisfied user. GEO. F. PARSONS.

### Inglorious Devon.

Sir,—I was interested to read your correspondent's letter on this subject in your issue of August 22nd, and I do not think for a moment there are any Devonian motorists who will not agree with him in every way. Our roads are an absolute disgrace, both as to repairs and maintenance, and apparently there is little or no organised supervision, as invariably the whole width of the so-called roadway is re-metalled at the same time, and what is worse is left so at night, while the methods and materials used in such work have been abandoned as obsolete in all up-to-date practice. The local councils controlling our system of roads are composed chiefly from the bucolic interest, who, while no doubt being excellent judges of manure, have not the least idea of up-to-date road work, with the result that the bottom foundations of the road have vanished, resulting in the present pot-holes and grit which have made Devon a by-word all over England.

This policy adopted by the local authority has resulted in universal disgust, and the loss of a number of our best visitors, and the withholding of any support from the Road Board. Absolutely nothing will be done until concerted action has been taken by Devon motorists and no further licences renewed in the county. DISGUSTED.

Sir,—The North Devon roads have been very much in front of the footlights lately, but I think, in common fairness to the surveyors, it is decidedly unfair to class all the roads as bad, the roads in the urban areas are really all that can be asked for—the fault lays with the three huge rural areas, and these areas are as poor as they are large.

We now, however, see some prospect of improvement. The Barnstaple R.D. Council now admit that their roads are in an appalling state, and, believing that their surveyor has now more than he can deal with, at their last meeting appointed two road foremen to assist the surveyor. In the discussion it came out that the surveyor had no less than 600 miles of roads to supervise, and did it in a way without any assistance other than an office boy; it was also generally admitted that more stone was needed on the roads. This is decidedly encouraging.

The Lynmouth-Simonsbath-Dulverton Road has been in the hands of contractors for widening for a long time, and was due to be completed a year ago last April. The contractors have now thrown up their contract, and the Dulverton Council taken it up themselves. The road is now so bad that it is closed for traffic as being unsafe south of Brendon Twogates. I understand the Council intend to push on with the road improvement with all possible speed.

DEVONIAN.

The novel type sporting sociable referred to in S. Carter's letter.

# All The Refinements

## of an up-to-date motor cycle

### PROVED

by request - to be desirable  
and by test - to be reliable

are embodied in the

## New

## Model

**ENGINE.**—Jap 5-6 h.p. twin cylinder, 76 x 85 mm. bore and stroke, capacity, 770 cc. mechanically operated side valves; or Jap 7-8 h.p. twin cylinder, 85 x 85 mm. bore and stroke, capacity, 964 c.c., mechanically operated side valves.

**FRAME.**—The BAT improved (patent applied for) ball bearing spring frame. Perfect insulation of the rider, and a natural and comfortable sitting position.

**GEAR.**—The BAT two-speed gear box, gear wheels always in mesh, made from "Ubas" steel, carefully hardened and ground true after hardening; ball bearings throughout. Smooth and silent running. Operated by lever at side of tank.

**CLUTCH.**—The BAT internal expanding clutch (patent applied for), normally in action, released by foot lever on left hand side. Adjustment provided for slip, or can be locked tight up. No end thrust when driving.

**FOOT-STARTING.**—The new BAT foot-starter enables the rider to start the engine by a kick of the foot while seated in the saddle. With the low gear engaged the clutch is gently let in and the machine moves away as smoothly and easily as a thousand pound car. Whether used as a solo mount or with a sidecar the machine is always completely under control.

**TRANSMISSION.**—Renolds  $\frac{5}{8}$  x  $\frac{7}{8}$  in. Roller Chain.

**LUBRICATION** is effected by suction from the crank case. It is quite automatic, clean and reliable. We have used this system exclusively for the past seven years, and have every confidence in it.

**IGNITION.**—The Bosch high tension magneto. This is fitted directly over the engine, in a cradle which forms part of the frame. The tank is recessed, and the magneto is covered in entirely. It is driven by bevel gears carried on either end of a vertical live shaft. The drive is silent, smooth and positive.

**BRAKES.**—Two very powerful foot brakes, independent action, easy adjustment.

**MUDGUARDS.**—4 in. steel, specially strengthened. Side wings to front mudguard.

### To Prevent Shorting.

Sir,—Your reader who asks for a waterproof glue will find the composition as below very effective to prevent wet from shorting the magneto at the carbon brushes.

Put two pennyworth of resin broken up into a basin (not a soldered tin) and a table spoonful of lubricating oil, place in a hot oven, and when all is melted together, stir up and test by dipping a piece of wood in and put a drop on a cold plate; if too brittle add oil, if too soft add resin, clean any grease off parts intended to be covered, and then start building up with the composition hot, and as it cools it can be built up to cover the whole.

F. W. APPLEBEE.

### The Freemasonry of the Road.

Sir,—I would remind the gentleman with a Rudge and sidecar (lady passenger) whom my friends and I (riding 1912 Douglas and a Humber and sidecar) found hung up a few miles from Southend on August Bank Holiday, to whom I lent a plug, that he has not as yet returned to me as promised. I trust he will be so good as to do his part, not for the value of the plug to me, but in appreciation of the time spent with him in tightening up his magneto near Rayleigh, also overhauling his carburetter at Romford. Maybe he has mislaid my address, which is Amstel House, East Sheen, Surrey.

F. C. PARRATT.

Sir,—On Sunday last I had the misfortune to run into a hedge at a very bad bend with my New Hudson and sidecar, buckling my front forks, but otherwise coming to no harm. I had just surveyed the damage when a motor cyclist and sidecar came along, and, stopping, helped me to get the machine to a neighbouring farm, after having satisfied himself he could not temporarily repair the forks. While thus occupied a big touring car came along, and the driver (owner) offered to take us to our destination, but as we were going in the opposite direction we did not trouble him.

Who says that freemasonry of the road is dying out? After this experience my services will always be at the service of any unfortunate motor carist or cyclist on the road.

BB 354.

### Variable Gears.

Sir,—When is the light, cheap speed gear to come along? Take a two-speed Eadie pedal cycle gear. It increases the weight of a wheel by about 1 lb., costs 14s., and as to its strength, a friend of mine, a racing cyclist, often averages 20 m.p.h. with this gear fitted, and has climbed Westerham and Cudham. Could not a stronger edition of this gear be made for motor cycles, to add about 2 lbs. to the weight of a wheel, and cost, say, 35s.? This price, I should think, would allow of a good profit being made, as there is practically the same amount of work in a gear, whether large or small. In the case of belt-driven machines, a belt rim would, of course, have to be fitted in place of a sprocket.

W. H. SIMON.

### A Strange Proceeding.

Sir,—Whilst motor cycling just outside Abergavenny I passed a carriage and pair. Thirty yards further my cap blew off, and on returning for the same the owner of the conveyance got out in a very excited way, took my number, and said it was a scandalous shame the way motorists were using the roads, at the same time saying I could either do what two other motorists did last week (pay 10s. towards the local hospital) or take the consequences. I then offered him 5s., which he took. The above gentleman is a J.P., but this occurred just on the borders of Monmouthshire; his county is Brecon. Was this a legal proceeding, and was it in his power to prosecute? I travelled carefully past the horses, but on the clear down grade I naturally increased speed later.

H. PERCIVAL.

### The French Reliability Trial.

Sir,—I have been surprised to read in *The Motor Cycle* the information that the motor cycle reliability trial organised by the Touring Motor Club de France and the Veloce Club de Tours—Paris Tours—to be held on September 29th, would not be run under the control of the Automobile Club de France.

I am pleased to inform you, and am directed to do it, that, on the contrary, this event will be run in accordance with the Automobile Club de France regulations, and that any British competitors have not to fear suspension from the Automobile Association and Auto Cycle Union.

Mr. Hugo Storr, the Touring Motor Club de France president, is to send you the race regulations, and in case any British riders would run the course, I beg to inform them, through your valuable paper, that they will find good assistance in Tours. Any information can be got from the undersigned.

G. GEO. BELLNOT,

V.C.T. VICE-PRESIDENT, 14, Rue des Halles, Tours.

### Dangerous Cross Roads.

Sir,—Referring to "A.C.'s" letter of August 22nd, which appeared under the heading "Dangerous Cross Roads," I would mention a sad accident that occurred some three miles from Newmarket on the Norwich Road recently.

A young man employed in a motor cycle garage was out for a short ride. When approaching the main road to Norwich from Newmarket, he saw a motor car travelling at a high speed along the main road. The dust raised by this car obscured a second car which was following it, with the result that the motor cycle met the car broadside on. The cyclist's head met the bonnet of the car, and the car swept rider and cycle into a hedge; the car followed, knocking down a signpost. The cyclist was rendered unconscious till the time of his death some few hours afterwards. At the inquest the driver asserted that, owing to the dust raised by the first car, he could see nothing till the accident. I hope this will be a warning to anyone who is not cautious about crossing main roads.

L. E. S. VAILE.

ANNUAL 24 HOURS' RIDE, WOODFORD TO YORK AND BACK.

Competitors leaving York, the turning point in the Essex Motor Club's Woodford to York and back 24 hours' ride.

## COVENTRY CLUB'S OPEN HILL-CLIMB.

Another Record Entry Run off Promptly and Without Accident.

**A**LL ways led to Woodway Hill, Dodford, near Daventry, on Saturday, for such was the venue of the seventh annual open hill-climb of the Coventry and Warwickshire Motor Club. The early birds started at 7.30 a.m. in the shape of a detachment of the Rudge Cyclist Corps, who annually render the club invaluable assist-

quently, practising (prohibited) went on day after day. It is certain that less than twenty riders sampled Woodway before their timed ascents. The measured stretch was three furlongs, and the gradient averaged about 1 in 9. The surface was in excellent condition. There are no bends on the hill, and its only fault is its easy nature; but if ever there was a "safe" hill, certainly it is Woodway.

Miss May Walker (2½ h.p. Hobart) starting in Class I. for lightweights. She was the only lady competitor.

### At the Start.

By one o'clock there was a big crowd of spectators assembled. Chief Marshal V. Holroyd and Hon. Sec. G. Smith had ranged up the willing officials in the respective positions, the telephone announced a clear course, Mr. Alec Ross had a long line of competitors in readiness, but the timekeepers were missing! A few minutes' delay while Messrs. Ebbelwhite and Wakeford took up their positions, a start was made, and thereafter a stream of competitors at regular intervals combined to keep the spectators interested.

### Ladies First!

**CLASS I.**—Standard-pattern Touring Lightweights (with engines up to 350 c.c.). Twenty-two entries. First on formula, Dodford Cup; fastest time, gold medal.

Miss May Walker (Hobart) was first up. She, however, mistook a signal to start, and had another attempt. She made a good climb, but in finishing ran on to the grass at the roadside, probably the only narrow squeak of the day.

Three Douglas machines were particularly fast, likewise the 2½ h.p. Singer ridden by Stanley, whilst Wright's Humber impressed the onlookers. F. W. Barnes (2½ Zenith), though allowed to run, was ruled out by a decision of the committee to debar engines with two overhead valves from the touring classes. He was actually eleventh on time and third on formula.

ance by performing the weighing, erection of banners, and the 101 other jobs necessary to ensure smooth working of a big entry such as the Coventry Club are usually able to command. Fortunately, the weather was bright and fine.

Weighing commenced at 10 a.m., two pairs of scales and tripods being in position. After each machine had been weighed and the totals noted by the results calculators, Messrs. J. W. Roebuck, Wh. Ex., J. L. Milligan, B.Sc., and E. Caudwell, the scrutineers took possession of the machine for a few moments to check it over with the regulations. In Messrs. J. R. Haswell, I. B. Hart-Davies; and C. S. Burney, the club had three hard-working examiners, who carried out their important tasks excellently. All are keen riders with considerable racing experience, and consequently knew all the little fakements and dodges resorted to by the unscrupulous to obtain extra speed from "their standard touring mounts." There was considerable amusement when Haswell put a hand mirror underneath a silencer and discovered what he expected—a gaping hole! It is something to the credit of the competitors that such practices were few and far between. Passenger machines were weighed in Daventry, and after the operation all were ranged in systematic order in the orchard, specially hired for the occasion, at the hill summit. A field at the foot of the hill was used just before the contest began.

### The Selected Hill.

Woodway Hill, Dodford, is new so far as hill-climbing competitions go. There is little to choose in the way of hills in the Coventry neighbourhood, and consequently the wise-aces thought Newnham must be the secret hill. They were not discouraged in the belief by the officials, and conse-

A Corah-Jap rider half-way up the hill.

THE FINISHING POINT.

The results calculators, who worked out the results while the competition was in progress, will be noticed on the left. There were 196 entries, but every result was known by 6 p.m.

CLASS I.

Results on Time.

1.	{ F. Ball (2½ Douglas) ... .. }	38½s.
	{ G. E. Stanley (2½ Singer) ... .. }	
3.	{ W. W. Douglas (2½ Douglas) ... .. }	39s.

5.	F. G. Edmond (2 Humber) ... ..	176
6.	S. L. Bailey (2½ Douglas) ... ..	181

CLASS II.—Standard Touring Motor Cycles (variable or fixed gears, with engines from 350 c.c. to 500 c.c.). Twenty-six entries. First on formula, gold medal; fastest time, Woodway Cup.

The speeds accomplished in this event were appreciably faster than in the lightweight section, though most of the 3½ h.p.'s had single gears and were consequently slower in getting under weigh than the variably geared juniors. In this connection it should be mentioned that the standing start considerably affected the result. Often machines proved very sluggish in firing and were slow in picking up. The results below show the six fastest machines, though special mention should be made of Stanley, who sat his machine well and was obviously the speediest up the hill. The Singer man had a field day on Saturday. Vernon Taylor's ascent on a Rudge was certainly impressive, likewise C. T. Newsome's (Rover).

The "W.D." with forced lubrication was particularly silent, but there was no doubt about its speed and power. Newman—always a fancied man in hill-climbs—had to be content with second place, likewise Woodhouse, another Precision engine expert. L. A. Bees rode well on an L.M.C. and should do better after a little experience. K. H. Clark (Corah) could not get his engine to fire. Cork and Howard (Matchless) were debarred from this class on account of their overhead valved engines.

CLASS II.

Results on Time.

1.	G. E. Stanley (3½ Singer) ... ..	34½s.
2.	H. C. Newman (3½ Ivy-Precision) ... ..	36½s.

6.	H. C. Newman (3½ Ivy) ... ..	211

The Stopping and Restarting Test.

CLASS III.—Standard Touring Variably-gear'd Machines (with engines up to 585 c.c.). The regulations were: "Competitors in this class must stop between the two lines in the middle of the hill, and, after bringing the road wheels to rest, restart without assistance and without leaving the saddle." First on formula, gold medal presented by the Britannia Foundry Co., Ltd.; fastest time, prize (presented by Messrs. Hobart Bird and Co., Ltd.).

Class III., for variably geared touring machines, proved a welcome change, and there was soon a crowd in the middle of the hill to witness the hurried stops and restarts. The test sounds simple enough, but as a matter of fact it is extremely difficult to stop in a few yards, declutch, keep the engine running, and restart on the low gear. Try it! F. Clarke (Rudge multi), the first up, performed as neatly as anyone, making good use of his powerful rear brake. V. Busby (Humber) overshot the second line before stopping. North (Ariel) was good, and more adept than his companion Newey; Barnes (Zenith) was as cool and sure as one would expect such an old hand would be; Woodgate (Singer) was rather slow; Walsgrove (Hazlewood) stopped his engine; Jameson (Enfield) wobbled badly and lost time; Dixon (Singer) was handicapped by a strange machine with brake and clutch pedals on the same side; Wright (Humber) stopped neatly and accelerated in wonderful fashion for so small an engine; Whitworth (Douglas) was also good. Barnes would have won on formula but for the rule referred to.

CLASS III.

Results on Time.

1.	{ F. C. North (3½ Ariel) ... .. }	54½s.
	{ S. Wright (2½ Humber) ... .. }	
3.	F. Clarke (3½ Rudge) ... ..	56½s.
4.	F. S. Whitworth (2½ Douglas) ... ..	57½s.
5.	J. J. Woodgate (2½ Singer) ... ..	64s.

4.	F. C. North (3½ Ariel) ... ..	404
5.	J. J. Woodgate (2½ Singer) ... ..	422

The Rollo cyclecar going well half way up the hill. This machine, the only four-wheeler, created much interest.

TWO ASPECTS OF THE WINNER OF THE VARIABLE GEAR CLASS TAKEN AT THE SAME INSTANT.

Sam Wright (2½ h.p. three-speed Humber) from above and below, in the stopping and starting test. It may be noticed that the photographers have snapped each other.

### A Twin wins the Formula Prize.

CLASS IV.—Tourist Trophy Machines (with engines up to 500 c.c.). First on formula, President's Cup; fastest time, gold medal; second on formula, prize; second fastest time, prize.

With forty-three competitors in the T.T. class some good ascents were witnessed, though it was difficult, if not impossible to distinguish the fastest of the leaders. Weatherilt made the best use of his Gradua gear in starting, and undoubtedly gained a second or two on Stanley in this way. Holloway (Premier) got off the mark smartly and flashed up the 1 in 8 section, likewise Wessendorff, a new comer, who caused some surprise. Edwards on a Triumph was the fastest private owner. It will be noticed from the formula results that at last a twin has a chance of success in this section, that is, if the performance is sufficiently meritorious, thanks to *The Motor Cycle* formula. It means quite a lot of added interest to hill-climbing contests.

#### CLASS IV.

6. E. Kickham (2½ Douglas) ...	181

### Interest in the Passenger Machines.

CLASS V.—Touring-pattern Cyclecar and Sidecar Machines.

First on formula, Daventry Cup and souvenir for passenger; fastest time, gold medal and souvenir for passenger; second fastest time, prize and souvenir for passenger.

The passenger class with twenty-one entries was much appreciated. Most started by the clutch, some got under power by dint of laborious shoving; other ingenious competitors started their engines, and at the signal to start had arranged for their passengers to engage the low gear from the sidecar seat, the "driver" pushing his hardest. Newman and Woodhouse used single gears.

The 8 h.p. Williamsons made the best starts churning up the gravel on being given the starting order. Though Barnes made the fastest climb, at last the veteran has found his match. G. Griffiths (8 Zenith) pulled a fastener out on his first essay, but begged to be allowed to be timed.

SUCCESSFUL COMPETITORS IN THE COVENTRY &amp; WARWICKSHIRE, M.C. OPEN HILL-CLIMB.

F. Ball (2½ h.p. Douglas) fastest time in Class I.

F. C. North (3½ h.p. Ariel), fastest time in Class III.

**Coventry Club's Open Hill-climb.—**

The starter agreed, and he recorded the time of 38½s., actually 3½s. faster than Barnes. The latter used a twin Jap of 85×85.5 mm., but Griffith had a 90×77.5 mm.

**The Only Four-Wheeler.**

The Rollo, the only four-wheeler competing, took 54½s. By the way, this smart looking cyclecar with passenger and all complete weighed 896 lbs. The Crouch carette was the heaviest vehicle, totalling 1,232 lbs. all on.

In connection with the awards, it is worthy of record that the Coventry Club have introduced a new feature, that is souvenirs for passengers, the idea being that in sidecar climbs the passenger plays an important part.

**CLASS V.**

*Results on Time.*

1. F. W. Barnes (8 Zenith) ...	42½s.
2. H. M. Jameson (6 Enfield) ...	43½s.
3. H. C. Newman (3½ Ivy-Precision) ...	48½s.
4. W. W. Douglas (8 Williamson) ...	48½s.
5. { Clifford Wilson (8 Williamson) ...	50½s.
{ G. E. Stanley (3½ Singer) ...

1. G. E. Stanley (3½ Singer) ...	208
2. H. C. Newman (3½ Ivy-Precision) ...	215
3. H. M. Jameson (6 Enfield) ...	217
4. J. W. Woodhouse (3½ Regal) ...	256
5. F. W. Barnes (8 Zenith) ...	262
6. F. C. North (3½ Ariel) ...	287

**The Open Class with Forty-seven Riders.**

**CLASS VI.**—Open (motor bicycles of all descriptions). No restrictions except as to brakes. First on formula, The Godiva Cup; second on formula, prize; fastest time, cup presented by Mr. John V. Pugh, J.P.; second fastest time, gold medal.

Class VI., the best supported event, was a mixture of all kinds of machines, some out for formula awards, others for fastest time. Chief among the latter were six machines with monstrous twin J.A.P. engines, a 7 h.p. Indian, a 7 h.p. Blumfield and two 8 h.p. Williamsons. The class was soon run off, as the rule confining a competitor to one ascent, irrespective of the number of classes entered (excepting III. and V.) weeded out a goodly number.

We noticed that several of the big machines were ten seconds or so before they could be persuaded to fire, but when once on the move they fairly flew, delighting the crowd at the top. Barnes was expected to win on the 8 h.p. Zenith, but Harry Reed, on a single geared chain-driven Dot-Jap

with overhead valves, proved more than a match, his speed being terrific. He averaged 45 m.p.h. from a standing start, which means well over 60 m.p.h. towards the summit. It was a marvellous climb. Barnes was next, hotly pressed by Cookson, a private owner of a Matchless. Griffith was slow at the start, also Cuffe (Indian). The twin Blumfield travelled very fast, also Hands on a stripped Williamson. Stanley and Holloway were the only single-cylinder riders seriously to challenge the twin-cylinder exponents for the honour of fastest time of the day. Weatherilt, on the 2½ h.p. Zenith, scored another striking success on formula, with Cocker (Singer) and Bailey (Douglas) in close attendance.

**CLASS VI.**

*Results on Time.*

1. Harry Reed (8 Dot-Jap) ...	30s.
2. F. W. Barnes (8 Zenith) ...	31½s.
3. J. J. Cookson (8 Matchless) ...	32½s.
4. G. Griffith (8 Zenith) ...	33s.
5. T. F. Blumfield (7 Blumfield) ...	33½s.
